Integrated Planning System (IPS): "The IPS is envisioned to be "*a planning process involving three levels of planning: (a) strategic; (b) operational; and (c) tactical. The planning process will result in the development of a family of related planning documents to include strategic guidance statements, strategic plans, concepts of operations, operations plans, and, as appropriate, tactical plans"* (Source: Annex I, HSPD-8). The IPS deliverable is due to the Homeland Security Council (HSC) on 4 February, 2008." (**DHS**, *IPS* (**Ruff)** 8 Jan 2008 Memo.)

Integrated Planning System (IPS): "The IPS provides the process by which we translate our policies, strategies, doctrine, and planning guidance into a family of strategic, operational, and tactical plans. This system applies to all Federal agencies with a role in homeland security. The IPS should also inform the planning activities of state, local and tribal governments, non-governmental organizations, and private sector entities with a role in homeland security. The

Secretary of Homeland Security (Secretary) administers the IPS. The IPS planning process will result in the continuous development and revision of a family of integrated, related planning documents, including strategic guidance statements, strategic plans, concepts of operations, and operations plans." (**DHS**, *IPS Description* **(Ruff)**, v2.2 1-3-2008)

Integrated Planning System (IPS): "The Integrated Planning System is the national planning system used to develop interagency and intergovernmental plans based upon the National Planning Scenarios. Local, tribal, State, regional, and Federal plans are mutually supportive." (**DHS**, *National Response Framework*, January 2008, 28)

Integrated Planning System (IPS): "The IPS fulfills the requirement for a standardized national planning process and integration system as directed by Annex I to HSPD-8. The IPS provides a basic, general framework for developing a series of products leading to a synchronized Federal plan. The IPS is designed to provide a "how to" guide for Federal agencies (as well as State, local, and Tribal governments) for the development of contingency planning documents." (**FEMA**, *(Interim) Integrated Planning System (IPS) for Homeland Security (Draft Version 2.3).* July 3, 2008 copy, p.1-1)

Integrated Planning System (IPS): "The IPS replaces the National Planning and Execution System (NPES)." (**FEMA**, *(Interim) Integrated Planning System (IPS) for Homeland Security (Draft Version 2.3).* July 3, 2008 copy, p.1-2), footnote 7)

Integrated Planning System (IPS): "The Integrated Planning System (IPS) was mandated by the President in Annex I (National Planning) to HSPD-8 (National Preparedness). The system will guide planning across Federal Departments and Agencies, and the integration between Federal scenario-based planning and State / local capabilities-based planning. IPS will provide consistent direction and delineation of authorities, responsibilities and requirements. It was designed on the same planning principles established by the State and Local emergency management community through the Comprehensive Preparedness Guide – 101 (draft) "A Guide for All-Hazard Emergency Operations Planning for State, Territorial, Local and Tribal Governments" to ensure consistency between the Federal and State, Local and Tribal planning structures." The development and management of IPS is handled by the DHS Office of Operations Coordination and Planning. FEMA is participating in the effort and manages several actions associated with its implementation, including CONPLAN development and integration with State/local/Tribal planning (**FEMA**, *Statement of R. David Paulison…Hearing on: "Nuclear Terrorism: Providing Medical Care and Meeting Basic Needs in the Aftermath – the Federal Response,"* June 26, 2008, p. 2)

Integrated Planning System (IPS): Mandated by Annex I to HSPD-8, entitled "National Planning:" "No later than 2 months after the issuance of this Annex, the Secretary of Homeland Security (Secretary) shall submit to the President for approval…an Integrated Planning System (IPS) that is developed in coordination with the heads of Federal agencies with a role in homeland security and that (a) provides common processes for developing plans, (b) serves to implement phase one of the Homeland Security Management System, and (c) includes the following:

i. national planning doctrine and planning guidance, instruction, and process to ensure consistent planning across the Federal Government;
ii. a mechanism that provides for concept development to identify and analyze the mission and potential courses of action;
iii. a description of the process that allows for plan refinement and proper execution to reflect developments in risk, capabilities, or policies, as well as to incorporate lessons learned from exercises and actual events;
iv. a description of the process that links regional, State, local, and tribal plans, planning cycles, and processes and allows these plans to inform the development of Federal plans;
v. a process for fostering vertical and horizontal integration of Federal, State, local, and tribal plans that allows for State, local, and tribal capability assessments to feed into Federal plans; and
vi. a guide for all-hazards planning, with comprehensive, practical guidance and instruction on fundamental planning principles that can be used at Federal, State, local, and tribal levels to assist the planning process." (**White House**, *Annex I "National Planning*," NSPD-8, December 4, 2007, p. 3)

Integrated Planning System (IPS) Fundamental Concepts: "Understanding of several key fundamental concepts is important to ensure effective use and implementation of the IPS:

1. The IPS has been developed recognizing that homeland security planning is based on coordination and synchronization rather than command and control.
2. The IPS applies to Federal departments and agencies with a role in homeland security when conducting scenario-based planning….
3. While State, local and Tribal governments are not required to adopt this system, they are strongly encouraged to do so….
4. The IPS establishes a process for developing Federal plans….
5. The IPS is not designed to solve every planning problem that exists at the present time….

(**FEMA**, *(Interim) Integrated Planning System (IPS) for Homeland Security (Draft Version 2.3)*. July 3, 2008, pp. iii-v)

Integrated Planning System (IPS) Purpose: "*The purpose of the Integrated Planning System (IPS) is to further enhance the preparedness of the United States by formally establishing a standard and comprehensive approach to national planning.* It is meant to provide guidance for conducting planning in accordance with the Homeland Security Management System (HSMS), described in the *National Strategy for Homeland Security of 2007*. The *Strategy* calls for a national effort to create and transform homeland security principles, systems, structures and institutions across four key pillars of homeland security:

- Prevent and disrupt terrorist attacks;
- Protect the American people, our critical infrastructure, and key resources;
- Respond to and recover from incidents that do occur; and Continue to strengthen the foundation to ensure our long-term success….

By introducing a standardized approach to national homeland security planning, the IPS is an important step in enhancing our national preparedness. As this system is implemented over time, it will align and synchronize our efforts at all levels of government – Federal, State, local and Tribal." (**FEMA**, *(Interim) Integrated Planning System (IPS) for Homeland Security (Draft Version 2.3)*. July 3, 2008, Foreward, p. iii)

Integrated Planning System (IPS) Purpose: "The IPS lays the initial foundation necessary to actualize the Homeland Security Management System (HSMS). It is a major step in

- establishing common Federal planning doctrine,

- providing a means for synchronizing operations across the spectrum of homeland security operations (prevent, protect, respond and recover) and

- integrating national planning efforts both horizontally across the Federal Government and vertically among Federal, State, local and Tribal entities.

However, further work is necessary to successfully integrate existing Federal guidance, policies, strategies, plans and legislation with the HSMS. To this end, through future refinement of the IPS and the development of other HSPD-8 Annex I deliverables such as the National Homeland Security Plan (NHSP), the Federal Government remains committed to addressing the following key issues in follow-on efforts:

- A mechanism to inform National Homeland Security planning efforts through a U.S. Government-wide risk-based analysis process.

- A process used to update the National Planning Scenarios.

- A standardized methodology to define and develop the required national capabilities and capacity necessary to execute IPS-generated plans.

- A standardized methodology that ensures the success of IPS-generated plans by integrating the Federal budgeting and resourcing processes necessary to execute IPS-generated plans." (**FEMA**, *(Interim) Integrated Planning System (IPS) for Homeland Security (Draft Version 2.3)*. July 3, 2008, Foreward, pp. iv-v)

Integrated Planning System (IPS) Scope and Applicability: "The IPS applies to Federal departments and agencies (henceforth, "agencies") with a role in homeland security when developing plans based on the National Planning Scenarios. Agencies with existing planning processes are required to ensure their systems are capable of producing plans consistent with plans produced using the IPS. Agencies with no existing planning processes are required to adopt the IPS.

The IPS does not supersede any existing State, local, or Tribal planning processes. However, it is the standard general planning system the Federal government will use for scenario based planning. It is designed to highlight commonalities among most planning processes as planners

often apply the same fundamentals, principles, and processes to developing plans regardless of the objective or desired effect of the plan they are developing. As such, the IPS accommodates many existing planning systems. The aim of the IPS is broad. Existing Federal planning processes can be better aligned through standard planning, shared nomenclature, transparency, and agreed upon allocations of capabilities and common objectives. The intent is not to disrupt ongoing Federal efforts, but to introduce a standardized planning methodology that best supports the Nation's homeland security priorities. The IPS also provides a method for Federal agencies to maintain their NIMS compliance as it is tied to the Preparedness component of NIMS." (**FEMA**, *(Interim) Integrated Planning System (IPS) for Homeland Security (Draft Version 2.3)*. July 3, 2008 copy, p.1-2)

Integrated Planning System (IPS) Target Audience: "The target audience for the Integrated Planning System (IPS) is, primarily, those Federal departments and agencies that engage in operational activities requiring significant complex planning, especially those reliant on, or responsible for providing, assistance to other agencies and thus reliant on the effective, understandable planning of other agencies. Ultimately, the IPS provides a common Federal planning process composed of three levels of planning: strategic, operational, and tactical. The IPS supports the development of a family of related planning documents. These documents include strategic guidance statements, strategic plans, concept plans, operations plans, and tactical plans. (**FEMA**, *(Interim) Integrated Planning System (IPS) for Homeland Security (Draft Version 2.3)*. July 3, 2008 copy, p.1-1)

Integrated Preparedness: "FEMA will be the Department's and U.S. Government's focal point for building our Nation's preparedness to defend and secure the United States of America from terrorist attack, and to respond to and recover from attacks, major disasters, and other emergencies. To accomplish this we will lead the preparedness efforts across the Department, coordinate preparedness efforts across the U.S. government, and partner with State and local governments, tribal organizations, the private sector, and the American people to ensure a Nation prepared. The primary goals of Integrated Preparedness are to:

- Build, sustain, and improve the Nation's capability to *prevent* terrorist attacks in the US.
- Build, sustain, and improve the Nation's capability to *protect* against terrorist attacks in the United States and other catastrophic threats to the Nation.
- Build, sustain, and improve the Nation's capability to *respond* to and *recover* from terrorist attacks, major disasters, and other emergencies, with an emphasis on catastrophic incidents.
- Ensure development of national standards and measures of effectiveness for preparedness.
- Promote and institutionalize mechanisms for information sharing and collaboration to enhance preparedness.
- Foster an adaptive, risk-based approach to preparedness that maintains an all-hazard incident management foundation and focuses on preparedness enhancements for catastrophic threats, where appropriate.
- Demonstrate good stewardship of public resources by identifying opportunities for synergy between terrorism preparedness and non-terrorism preparedness.
- Create, operate and promote a premier learning organization by providing professional development, education and other opportunities to ensure the highest caliber of staff working in a professional environment in support of the goals and objectives of the Department.

- Streamline and speed delivery of preparedness activities and services." (**FEMA**, *Vision for New FEMA*, December 12, 2006, p. 23)

Integrated Preparedness and Response: "*Integrate strategies.* Emergency preparedness must be integrated into the operations of all state agencies. And emergency response must produce a unified strategy that brings together the response capacity of fire, law enforcement, emergency management, public health and public works and other agencies and professions that would be called upon for emergency and catastrophic response. The State's preparedness leader must ensure that each agency in a leadership and supporting capacity for preparedness is up to the job and reliable when called upon. A cabinet-level, interagency council for preparedness can help integrate preparedness throughout the executive branch and across disciplines. The governor's emergency preparedness leader could chair that council." (**Little Hoover Commission**, *Safeguarding the Golden State: Preparing for Catastrophic Events*, 2006, 39)

Integrated Public Alert Warning System (IPAWS): "The Integrated Public Alert and Warning System (IPAWS) is the Nation's next generation public communications and warning capability. FEMA and the IPAWS Program Management Office (PMO) will work with public and private sectors to integrate warning systems to allow the President and authorized officials to effectively address and warn the public and State and local emergency operations centers via phone, cell phone, pagers, computers and other personal communications devices." (**FEMA** *Integrated Public Alert and Warning System (IPAWS)*, 11 Nov 2007).

Integrated Public Alert Warning System (IPAWS): "Pursuant to Executive Order 13407, IPAWS is a comprehensive DHS/FEMA program, in partnership with NOAA, the FCC, and other public and private stakeholders, begun in 2004 to improve public alert and warning. The system will deliver digitally-based alert and warning messages to radio and television stations, personal computers, cell phones and other consumer wireless devices. The System seeks to upgrade EAS, enhance NAWAS, and begin other pilot programs, among other initiatives for current technological options." (**Homeland Security Council**, *NCPIP*, Aug 2007, p. 63)

Integrated Risk Information System (IRIS): "IRIS (Integrated Risk Information System) is a compilation of electronic reports on specific substances found in the environment and their potential to cause human health effects. IRIS was initially developed for EPA staff in response to a growing demand for consistent information on substances for use in risk assessments, decision-making and regulatory activities. The information in IRIS is intended for those without extensive training in toxicology, but with some knowledge of health sciences." (**EPA**, *IRIS*, Dec. 2007)

Integrated Systems Approach: "An integrated systems approach recognizes the necessity of cooperation and partnerships between schools and systems outside of the school. These may include law enforcement, social services and mental health providers, the courts, community agencies, families, worksites, religious organizations, and others." (**US Secret Service and DOE**, *Threat Assessment in Schools…*, 2002, p. 36)

Integrated Timeline: "The integrated timeline provides a retrospective timeline of exercise events created during exercise analysis." (**FEMA**, *HSEEP Glossary*, 2008)

Integration: "Integration is the combining of efforts and capabilities from multiple sources to more efficiently and effectively achieve a common purpose. Integration is achieved by appropriately leveraging strengths from available sources to fill gaps and compensate for weaknesses." (**DHS**, "The Homeland Security Challenge, *Draft DHS Pub 1*, Feb 2008, p. 1-10)

Intelligence: "Can be defined slightly differently depending on the agency or organization of focus, but generally speaking can be defined as, the combination of credible information with quality analysis—information that has been evaluated and from which conclusions have been drawn.

- **Raw Intelligence** – Collected information/data that has not been processed, integrated, analyzed, evaluated, and interpreted.
- **Finished Intelligence** – The product resulting from the processing, exploitation, integration, evaluation, analysis and interpretation of collected information & data.
- **Strategic Intelligence** – Information tailored to support the planning and execution of agency-wide intelligence and investigative programs, and the development of long term policies, plans and strategies.
- **Tactical Intelligence** – Information that directly supports on-going operations and investigations." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, p. 36)

Intelligence and Information Sharing and Dissemination Capability Description: "The Intelligence and Information Sharing and Dissemination capability provides necessary tools to enable efficient prevention, protection, response, and recovery activities. Intelligence/ Information Sharing and Dissemination is the multi-jurisdictional, multidisciplinary exchange and dissemination of information and intelligence among the Federal, State, local, and tribal layers of government, the private sector, and citizens. The goal of sharing and dissemination is to facilitate the distribution of relevant, actionable, timely, and preferably declassified or unclassified information and/or intelligence that is updated frequently to the consumers who need it. More simply, the goal is to get the right information to the right people at the right time. An effective intelligence/information sharing and dissemination system will provide durable, reliable, and effective information exchanges (both horizontally and vertically) between those responsible for gathering information and the analysts and consumers of threat-related information. It will also allow for feedback and other necessary communications in addition to the regular flow of information and intelligence." (**DHS**, *TCL,* 2007, p. 69)

Intelligence Gap: "An unanswered question(s) regarding a criminal, cyber or national security issue or threat. (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, p. 36)

Intelligence Information Need: "Describes information and/or intelligence needed to eliminate intelligence gaps." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, p. 37)

Intelligence/Investigations Function (IIF): "The Intelligence/Investigations Function within the Incident Command System (ICS) provides a flexible and scalable framework that will allow for the integration of intelligence and investigations activities and information -- Defined as information that either leads to the detection, prevention, apprehension, and prosecution of criminal activities (or the individual(s) involved) including terrorist incidents or information that

leads to determination of the cause of a given incident (regardless of source) such as public health events or fires with unknown origins." (**FEMA**, *IIFOG Ver. 3*, Feb 2008, 1)

The Intelligence/Investigations Function provides several crucial benefits to an Incident Commander/Unified Command (IC/UC), including, but not limited to the following:

- Provides an IC/UC with classified information, Sensitive Compartmented Information and Sensitive Information in the same manner as these types of information would be made available to Federal government personnel who may be responding to the incident.

    - Allows an IC/UC to initiate Intelligence/Investigations operations concurrently with life safety operations in order to protect evidence at crime and investigative scenes while ensuring that life safety operations remain the primary incident objective (See chart 1, page 4).

    - Allows an IC/UC to determine whether the incident is the result of criminal acts or terrorism, and to maximize efforts to prevent additional criminal activities or terrorism.

      When appropriate, provides a means of linking directly to the Federal Bureau of Investigation's (FBI) Joint Operations Center (JOC) to provide for constant information-sharing to ensure that operational activities undertaken by varying agencies are not in conflict (e.g., crime scene processing, interviewing witnesses, physical surveillance), and affords coordination with other information-sharing entities including Regional Fusion Centers, Regional Intelligence Sharing Consortiums and the National Counter Terrorism Center.

    - Ensures that an IC/UC has the appropriate personnel with the necessary subject matter expertise to conduct the required intelligence/investigative operations. (Ibid, p.3)

Intelligence Personal Radiation Locator (IRPL): "The IPRL emerged from an end user requirement for a next-generation personal radiation detection system similar to the radiation pagers often used by CBP, first responders, and law enforcement officials. IPRL will have sufficient energy resolution and sensitivity to reliably discriminate between NORM, background, and potential threats, and will be used by law enforcement, first responder, counterterrorism, the intelligence community and others in routine activities and surveillance. (**DHS**, *Opening Statement of Vayl Oxford*, March 8, 2007, 7)

Intelligence Reform and Terrorism Prevention Act (IRTPA) of 2004 (P.L.108-458): "…authorizes state and local government officials in the National Capital Region (NCR), and federal officials, to enter into mutual aid agreements for emergency response, preparing for or recovering from an emergency, or training for such activities. The law also specifies that EMAC [Emergency Management Assistance Compact] provisions are not affected by the legislation." (**CRS**, *The Emergency Management Assistance Compact (EMAC): An Overview*, 2008, p. 5)

Intelligence Requirement: "The information and/or intelligence that must be collected and produced to eliminate intelligence gaps. Intelligence requirements convert intelligence gaps and

the associated intelligence information needs into specific instructions regarding what information and/or intelligence to collect, report, produce and disseminate. Intelligence requirements provide the questions that you ask your HUMINT, and the information that you seek from your SIGINT, IMINT and OSINT. They are categorized as either Standing or Ad hoc Intelligence requirements. Standing intelligence requirements are focused on significant intelligence gaps that require a sustained, long term effort to resolve. Ad hoc intelligence requirements normally involve a particular investigation or incident and are resolved in short order." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, p. 37)

Intensity: "…refers to the damage-generating attributes of a hazard. For example, water depth and velocity are commonly used measures of the intensity of a flood. For hurricanes, intensity typically is characterized with the Saffir/Simpson scale, which is based on wind velocity and storm surge depths…The absolute size of an earthquake is given by its Richter magnitude (and other similar magnitude scales), but its effects in specific locations are described by the Modified Mercalli Intensity (MMI) Scale…Earthquake intensity is also ascertained by physical measures such as peak ground acceleration (expressed as a decimal fraction of the force of gravity, e.g., 0.4 g), peak velocity, or spectral response, which characterizes the frequency of the energy content of the seismic wave." (**Deyle, French, Olshansky, and Paterson** 1998, 124.)

Intensity (Earthquake): "A number by which the consequences of an earthquake at a particular place are scaled by its effects on persons, structures, and earth materials. Intensity scales in most common use are the modified Mercalli (MM) and Medvedev, Sponheuer and Karnik (MSK), both having twelve degrees." (**UNDHA**, *Disaster Management Glossary*, 1992, p. 47)

Intensity (Earthquake): "A measure of ground shaking describing the local severity of an earthquake in terms of its effects on the Earth's surface and on humans and their structures. The Modified Mercalli Intensity (MMI) scale, which uses Roman numerals, is one way scientists measure intensity." (**USGS**, *Putting Down Roots in Earthquake Country*, 2007, Glossary)

Interagency Board (IAB): "A working group established by the NCC [National Continuity Coordinator] to review and recommend validation of potential PMEFs [Primary Mission Essential Functions] submitted by agencies for submission to the NCC for final approval." (**DHS**, *FCD 1*, Nov 2007, P-6)

InterAgency Board for Equipment Standardization and Interoperability (IAB): "IAB, made up of local, state, and federal first responders, is designed to establish and coordinate local, state, and federal standardization, interoperability, compatibility, and responder health and safety to prepare for, train and respond to, mitigate, and recover from any CBRN incident." (**GAO**, *Homeland Security: First Responders*, June 27, 2008, p. 2)

Interagency Centers (Federal Disaster Assistance and Relief Centers): "Experience gained in the disasters of 1955 has contributed a workable plan of relief action that is still under development. It calls for the establishment of task force offices at strategic points in disaster areas. These offices are located to give on-the-spot relief to disaster victims and provide a central point for coordinating the activiites of Federal agencies and the American National Red

Cross. Representatives of the latter and FCDA constitute the staffs." (**FCDA**, *1955 Annual Report*, p. 42)

Interagency Centers (Federal Disaster Assistance and Relief Centers): "In the floods in California in December 1955, FCDA set up Interagency Centers at strategicv points in the disaster areas to coordinate Federal disaster relief. Twehnty-three Federal agencies and the American National Red Cross were represented at the Interagency Centers." (**FCDA**, *1956 Annual Report*, 1957, p. 34)

Interagency Coordinating Committee on Earthquake Hazards Reduction (ICC):
Established under section 5(a) of the Earthquake Hazards Reduction Act of 1977, as amended. "The Interagency Coordinating Committee shall oversee the planning, management, and coordination of the Program [National Earthquake Hazard Reduction Program]." (**Earthquake Hazards Reduction Act of 1977**)

Interagency Coordinating Council on Emergency Preparedness and Individuals with Disabilities. See Department of Homeland Security, ICCEPID.

Interagency Guidelines for Homeland Security Coordination: "Working in concert forges the vital links between the military instrument of national power and the economic, diplomatic and informational instruments of the US Government. Synchronization and integration of all instruments of national power are required to ensure the successful execution of HS missions. The challenges facing the Nation are increasingly complex and will require the skills and resources of many organizations…. Guidelines for interagency coordination include:
(1) Achieve unity of effort among a mix of federal, state and local agencies.
(2) Identify all agencies and organizations potentially involved in the operation.
(3) Identify key elements of information that various agencies can share.
(4) Establish an interagency hierarchy for the response effort.
(5) Identify appropriate resources of each participant.
(6) Define the objectives of the response effort.
(7) Define the desired end state and exit criteria.
(8) Define courses of action for the supporting effort.
(9) Identify potential obstacles.
(10) Maximize the mission's assets to support long-term goals.
(11) Establish interagency assessment teams.
See JP 3-08, Interagency Coordination During Joint Operations*, and National Security Presidential Directive (NSPD) 1,* Organization of the National Security Council System*, for more information.*" (**JCS/DoD**, *Homeland Security* (JP-3-26), 2005, p. II-15)

Interagency Incident Management Group (IIMG): "The IIMG facilitates headquarters level domestic incident management and coordination. The Secretary of Homeland Security activates the IIMG based on the nature, severity, magnitude, and complexity of the threat or incident. The IIMG is comprised of senior representatives from DHS components, Department of Justice, Department of Defense, Department of State, and other Federal departments and agencies and Non-Governmental Organizations (NGOs), as required. The IIMG membership is flexible and can be tailored to provide the appropriate subject matter expertise required for the specific

incident at hand." (*National Response Plan* (Draft #1), February 25, 2004, p. 21) [Replaced by the Interagency Advisory Council (IAC); (**DHS**, *Notice of Change to the NRP*, May 2006, p. 8)

Interagency Modeling and Atmospheric Assessment Center (IMAAC): "The IMAAC is responsible for the production, coordination, and dissemination of consequence predictions for an airborne hazardous material release. The IMAAC generates the official Federal prediction of atmospheric dispersions and their consequences utilizing the best available resources from the Federal Government. Guided by an interagency memorandum of agreement, several Federal agencies and departments support IMAAC planning and activities." (**DHS**, *Overview: ESF and Support Annexes Coordinating Federal Assistance In Support of the National Framework* (Draft), Sep 2007, p. 56)

Interagency Modeling and Atmospheric Assessment Center (IMAAC): "The goal of the IMAAC is to enhance our national capability through robust scientific cooperation among federal agencies that incorporates the best practices from federal and other programs as it seeks to improve federal modeling and assessment capabilities….The IMAAC will provide atmospheric hazards predictions in support of the lead federal agency for incidents of national significance. The IMAAC products will be recognized as the single source of federal hazards prediction and will be provided to federal, state, and local emergency responders and other government officials as necessary. The IMAAC will leverage existing federal capabilities and will be responsible for providing accurate, reliable estimates of predicted hazard areas, with associated concentrations, which will serve as the foundation for decisions by the authorized emergency managers." (**MOU**, *IMAAC, DHS*, September 23, 2004, p. 3)

Interagency Payment and Collection (IPAC) System: "The automated intergovernmental information system developed by the Department of the Treasury for billing services and supplies for small agencies. IPAC is the fastest/least costly method for reimbursing other Federal agencies for costs incurred as a result of mission assignments." (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 2007, p. 54)

Interagency Threat Assessment and Coordination Group (ITACG): "To improve the coordination of the sharing of terrorism-related information, as well as to implement recommendations developed in response to the President's December 16, 2005, Memorandum to the Heads of Executive Departments and Agencies, we have established an Interagency Threat Assessment and Coordination Group (ITACG) within the NCTC [National Counterterrorism Center]. Participants in this coordination group include DHS, FBI, members of the Intelligence Community, and State and local representatives. The coordination group will enable the development of "federally coordinated" perspectives on intelligence reports and analytical products regarding terrorist threats and related issues that address the needs of State, local, tribal, and, as appropriate, private sector entities." (**White House**, *National Strategy for Information Sharing*, 2007, p. 18)

InterCEP: International Center for Enterprise Preparedness, New York University.

Intercity Bus Security Grants (IBSGP): "IBSGP focuses on vulnerability assessments, security plans and preparedness exercises for explosives and non-conventional threats. Program priorities include facility, driver and vehicle security enhancements; emergency communications

technology; coordinating with local police and emergency responders; training and exercises; and passenger and baggage screening programs in defined UASI service areas. IBSGP provides funding competitively to eligible charter and fixed route intercity bus systems servicing UASI urban areas." (**DHS**, *Fact Sheet FY08 Preparedness Grants*, 1Feb08)

Interim Operating Facility (IOF): "Temporary field facility used by a FEMA-led ERT in the early stages of an incident prior to establishing the JFO. Generally located near the State EOC or the incident site. Site of interaction with State representatives and key ESF agencies, collection and assessment of information, and initiation of assistance programs." (**FEMA**, *IS 292*, 2007, p. 4-9)

Interim Site: "A temporary location used to continue performing business functions after vacating a recovery site and before the original or new home site can be occupied. Move to an interim site may be necessary if ongoing stay at the recovery site is not feasible for the period of time needed or if the recovery site is located far from the normal business site that was impacted by the disaster. An interim site move is planned and scheduled in advance to minimize disruption of business processes; equal care must be given to transferring critical functions from the interim site back to the normal business site. See Alternate Site, Cold Site, Hot site, Internal Hot Site, Recovery Site, Warm site." (**DigitalCare**, *State of OR BC Workshop*, 2006, p. 58)

International Board of Standards for Training Performance and Instructions (IBSTPI): "The International Board of Standards for Training, Performance and Instruction (ibstpi®) was founded as a not-for-profit corporation in 1984. ibstpi® has assembled a set of professionals of the highest repute from academia, private industry, military and government that represent diverse regions and cultures. ibstpi® is a leader in setting standards that help to improve individual and organizational performance by articulating and promoting the integrity of professional practice through research, development, definition of competencies and education." (**IBSTPI**, *We Set the Standards!* 2007)

International Code Council (ICC): "The International Code Council, a membership association dedicated to building safety and fire prevention, develops the codes used to construct residential and commercial buildings, including homes and schools. Most U.S. cities, counties and states that adopt codes choose the International Codes developed by the International Code Council…. The International Code Council (ICC) was established in 1994 as a nonprofit organization dedicated to developing a single set of comprehensive and coordinated national model construction codes. The founders of the ICC are Building Officials and Code Administrators International, Inc. (BOCA), International Conference of Building Officials (ICBO), and Southern Building Code Congress International, Inc. (SBCCI). Since the early part of the last century, these nonprofit organizations developed the three separate sets of model codes used throughout the United States. Although regional code development has been effective and responsive to our country's needs, the time came for a single set of codes. The nation's three model code groups responded by creating the International Code Council and by developing codes without regional limitations the International Codes." (**IIC**, *About the ICC*, 2008)

International Decade for Natural Disaster Reduction (1990-1999): "Given the increasing concern about the impact of disasters, the UN General Assembly declared 1990-1999 the

International Decade for Natural Disaster Reduction (IDNDR). Under the theme 'Building a Culture of Prevention', work was done to advance a wider commitment to activities that could reduce the consequences of natural disasters. Initially, IDNDR was influenced by largely scientific and technical interest groups. However, a broader global awareness of the social and economic consequences of natural disasters developed as the decade progressed." (**UN ISDR**, *Living With Risk*, Chapter One, 2002, p. 9)

International Emergency Management Compact (IEMAC): "On the 18th day of July [2000], in Halifax, Nova Scotia, Canada at the 25th Annual Meeting of the New England Governors and Eastern Canadian Premiers, the International Emergency Management Assistance Memorandum of Understanding (IEAMMOU) was signed by all parties. Modeled on EMAC, when ratified by the Legislature of each state, Congress and the comparable levels of government in Canada, this Compact will provide form and structure for mutual aid between the cited international parties. A similar Pacific Northwest Emergency Management Agreement has also been legally ratified and established between the States of Alaska, Washington, Oregon and Idaho and the Canadian Province of British Columbia and the Yukon." (**Libby**, *Statement of*, July 19, 2007, p. 4)

International Emergency Management Compact (IEMAC): "IEMAC is a mutual aid agreement between northeastern states and the eastern Canadian provinces. Signatories to IEMAC have established protocols to share personnel and equipment in a major emergency. IEMAC is known in Canada as the International Emergency Management Assistance Memorandum of Understanding (IEMAMOU). The International Emergency Management Group (IEMG) meets twice a year to review protocols and improve coordination. IEMAC has been used to send Maine DOT crews to Nova Scotia to help clear roads after a blizzard, and to bring search and rescue crews to Aroostook County from New Brunswick." (**Maine Emergency Management Agency**, *IEMAC*, December 7, 2007 Update)

International Standards Organization (ISO): "ISO is a network of the national standards institutes of 157 countries, on the basis of one member per country, with a Central Secretariat in Geneva, Switzerland, that coordinates the system. ISO is a non-governmental organization: its members are not, as is the case in the United Nations system, delegations of national governments. Nevertheless, ISO occupies a special position between the public and private sectors. This is because, on the one hand, many of its member institutes are part of the governmental structure of their countries, or are mandated by their government. On the other hand, other members have their roots uniquely in the private sector, having been set up by national partnerships of industry associations. Therefore, ISO is able to act as a bridging organization in which a consensus can be reached on solutions that meet both the requirements of business and the broader needs of society, such as the needs of stakeholder groups like consumers and users." (**ISO**, *About ISO*, 2007)

International Strategy for Disaster Reduction (ISDR): "Mission: The ISDR aims at building disaster resilient communities by promoting increased awareness of the importance of disaster reduction as an integral component of sustainable development, with the goal of reducing human, social, economic and environmental losses due to natural hazards and related technological and environmental disasters." (**UN/ISDR**, *Mission and Objectives*)

Interoperability: "`Interoperability' has two meanings: (1) The ability of systems, personnel, or agencies to provide services to and accept services from other systems, personnel, or agencies, and to use the services so exchanged so that these organizations can operate together effectively; (2) A condition that is realized among electronic-communications operating systems or grids and/or among individual electronic-communications devices, when those systems and/or devices allow the direct, seamless, and satisfactory exchange of information and services between the users of those systems and devices." (**DHS**, *FDC 1*, Nov 2007, P-6)

Interoperability: "We have known since September 11th and if not earlier that interoperability, the ability to talk among different emergency responders and police agencies is critical to effective management of an incident, whether it's a terrorist attack or a natural disaster. What this money is designed to do is give resources to states and cities to allow them to acquire the equipment and do some of the training necessary to make sure they have achieved the kind of interoperability that first responders are entitled to expect. We have begun this process in a disciplined way. The President instructed a little over a year ago that we do a survey with respect to how interoperability was doing in our states and our major urban areas. We completed that survey. We identified where there were shortfalls in equipment or shortfalls in terms of governance or agreements about the rules of the road. And then we began working with states and cities to see how those gaps could be filled. Having identified the gaps and having set forth a path to filling those gaps, the money that is being allocated here is the final piece of the puzzle that needs to be in place to make sure that we do have interoperability across the country….

"Let me conclude by saying this. You know part of the capability that is necessary is not just a matter of equipment. I mean clearly you have got to have the right equipment. But it is also a matter of training and it's a matter of having a common agreement on governance. People have to know what are the frequencies they're going to use or what is the gateway they're going to use to bridge the frequencies. They have to know what language they're going to use. Are they going to use the 10-code language familiar to the police or are they going to use plain English or are they going to use another set of terminology that is used by emergency responders. They have to determine who are the command elements that actually talk to one another. Some of this is a matter that can be addressed by money, but some of it requires frankly getting people to sit down and come to a common vision of the way they're going to organize themselves so they can be interoperable. I want to encourage communities not just to look to the money, but to make sure they're undertaking the hard work of putting together disciplined plans which are the keys to getting interoperability to become a reality….

"The stuff we can fix is this. We can give people money to buy equipment like gateways or things of that sort and to do some training. We can give people an assessment – states and cities – an assessment of where they are. We can give them guidance. Here are the things that states and cities have to do. They have to ultimately reach an agreement on governance. The police department, the fire department, the emergency services unit in a particular city or a particular region have to come to an understanding of the language they will speak to when they communicate with one another. They have to come to an understanding of what the appropriate level of a commander is to have interaction with colleagues in other services. They have to come to an agreement and an understanding of who will manage the gateway or the switch that allows people to talk to each other. That is not something the federal government can make people do.

We do not have the authority to do it and it would be unwise even if we had the authority to try to impose a Washington-based solution. We can put the tools on the table but the training and the willpower to use the tools has to rest with state and local officials." (**DHS Secretary Chertoff**, in: **DHS**, *Transcript Of Press Conference With Secretary Michael Chertoff And Secretary Carlos M. Gutierrez To Announce Nearly $1 Billion In First Responder Communications Grants*," July 18, 2007)

Interoperability & Compatibility: "A principle of the NIMS that holds that systems must be able to work together and should not interfere with one another if the multiple jurisdictions, organizations, and functions that come together under the NIMS are to be effective in domestic incident management. Interoperability and compatibility are achieved through the use of such tools as common communications and data standards, digital data formats, equipment standards, and design standards." (**DHS**, *National Incident Management System*, March 2004, p. 55.)

Interoperable Communications: "Communications that provide the capability to perform essential functions, in conjunction with other agencies, until normal operations can be resumed." (DHS, FED 1, Nov 2007, P-6)

Interoperable Communications Technical Assistance Program (ICTAP) DHS. See Department of Homeland Security, ICTAP.

Interoperable Continuum: "The Interoperability Continuum…outlines critical elements for the planning and implementation of successful public safety and service agencies' communications and interoperability solutions. These elements include governance, standard operating procedures, technology, training and exercises, and usage of interoperable communications. To drive progress along the five elements of the continuum and improve interoperability, public safety and service agency practitioners should observe the following principles:

- Gain leadership commitment from all public safety and services agencies.
- Foster collaboration across all public safety and services agencies for planning and implementation.
- Work with policy makers to gain leadership commitment and resource support for interoperability.
- Plan and budget for ongoing updates to systems, procedures, and documentation.
- Use interoperability solutions on a regular basis." (**DHS**, *TCL*, 2007, p. 39)

Interoperable and Survivable Communications: "To achieve interoperability, we must have compatible equipment, standard operating procedures, planning, mature governance structures, and a collaborative culture that enables all necessary parties to work together seamlessly. Survivable communications infrastructure is even more fundamental. To achieve survivability, our national security and emergency preparedness communications systems must be resilient – either able to withstand destructive forces regardless of cause or sufficiently redundant to suffer damage and remain reliable." (**White House**, *National Strategy for Homeland Security*, Homeland Security Council, October 2007, p. 47)

Interoperable Communications: "Public safety officials generally recognize that effective "interoperable" communications is the ability to talk with whom they want, when they want, when authorized, but not the ability to talk with everyone all of the time." (**GAO**, *Homeland Security: Federal Leadership Needed to Facilitate Interoperable Communications Between First Responders*, September 8, 2004, p. 1)

Interoperable Communications Technical Assistance Program (ICTAP): "…a program designed to enhance interoperable communications among local, State, and Federal emergency responders and public safety officials, and is associated with the Department of Homeland Security Office of Grants and Training's (G&T) Urban Area Security Initiative (UASI) grant program. Each team provides technical assistance in four phases: Phase 1: Define Technical Assistance Requirements; Phase 2: Define Enhancements Needed; Phase 3: Implementation; Phase 4: Continued services as needed until local support is in place." (**DHS**, *TCL*, 2007, p. 38)

Interoperability: "Interoperability is the communication between disciplines and jurisdictions that permits real time exchanges of information on demand, with whoever needs it, when properly authorized, in conformance with the Incident Command System." (**DHS**, *TCL*, 07, 38)

Investigation: "The systematic collection and analysis of information pertaining to factors suspected of contributing to, or having caused, an incident." (**FEMA**, *IIFOG Ver 3 Draft*, 2008, p. 37)

Investigative Scene: "An area or areas where investigative information may be obtained by identifying/interviewing witnesses; performing non-technical and technical canvasses; examining conventional, analog and digital investigative evidence (e.g., documents/text, images/photos, audios, data; utilizing eyewitness identification techniques). Investigative Scenes include:

- Casualty collection areas where ill/injured persons are gathered for emergency triage, treatment, and/or transportation to a health care facility.
- Areas where decontamination operations are conducted.
- Evacuation assembly areas/facilities.
- Shelter-in-place facilities/locations, when appropriate.
- Personnel checkpoints.
- Vehicle roadblocks.
- Traffic Control Points and Access Control Points.
- Family Assistance Centers.
- Mass transit facilities/conveyances.
- Health care facilities, when appropriate." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, p. 37)

Investment Planning Technical Assistance: A DHS service implemented in October 2006. Mission stated as to "seek to bring together a multi-disciplinary and multijurisdictional group of planners and homeland security personnel, and… [to] promote a common approach for investment planning and program management. These TA services…can be delivered either to individual states or regionally. The Investment Planning TA highlights best practices and is intended to guide state and local managers in a planning process for homeland security investments, including:

• Identifying and prioritizing the multiple homeland security program initiatives that may require funding;
• Collaborating with neighboring jurisdictions to discuss regional investments;
• Developing a business case and acquisition strategy that justifies investments;
• Identifying milestones and timelines necessary to meet project requirements; and
• Managing funding challenges related to re-scoping investment plans after funding is awarded." (DHS, *G&T Information Bulletin No. 221, Subject: Investment Planning and Program Management Technical Assistance*, October 2, 2006, p. 1)

Investment Officer: "`Investment Officers' applies to GPD [Grant Programs Division] personnel commonly known as 'Preparedness Officers' located within the Regions and at Headquarters." (FEMA, *Regional-National Preparedness Concept of Operations*, 8Feb2008, 5)

Invocation: "The act by which a Business Continuity Management or Crisis Management process is formally started. The term is often used to refer to the act of using a service such as work area recovery as offered by a commercial or third party provider. See: Activation and Declaration." (**DigitalCare**, *State of Oregon Business Continuity Workshop*, 2006, p. 58)

IOF: Initial Operating Facility. (**DHS**, *TCL*, 2007, p. 209)

IOM: Institute of Medicine, National Academies.

Ionizing Radiation: "Ionizing Radiation. The extent of tissue damage resulting from exposure to ionizing radiation depends on the type of radiation and the dose of exposure experienced.

1. Localized or focal tissue damage. One type of localized injury "beta burns" results when skin is exposed to beta emissions, either an intense source or for a long period. Another type of localized or focal tissue damage may be a result of an internal dose as a result of inhalation or ingestion of a radioactive particle. For example, if the common fission product iodine-131 is inhaled or ingested, it will likely concentrate in the thyroid gland and may cause tissue damage.

2. Acute radiation syndrome (ARS) occurs from whole-body exposure to radiation, not just specific areas of the body . . . the higher the radiation dose and dose rate, the earlier the symptoms will appear and more danger to exposed personnel. Individuals with a combination of injuries, blast and/or thermal combined with radiation exposure, will be more vulnerable to ARS. ISO: International Organization for Standardization (International Standards Organization).

ISO 17799: "International Standards Organization standard for information systems security management. The international standard includes best practices for business continuity management as it relates to information technology. The ISO standard is also available as British Standard BS 7799." (**Risky Thinking**, *Risk Glossary*, 2007)

ISO/PAS 22399, Societal Security – Guideline for Incident Preparedness and Operational Continuity Management: "ISO/PAS 22399:2007 provides general guidance for an organization — private, governmental, and nongovernmental organizations — to develop its own specific performance criteria for incident preparedness and operational continuity, and design an appropriate management system. It provides a basis for understanding, developing, and implementing continuity of operations and services within an organization and to provide confidence in business, community, customer, first responder, and organizational interactions. It also enables the organization to measure its resilience in a consistent and recognized manner.

ISO/PAS 22399:2007 is applicable to all sizes of public or private organizations engaged in providing products, processes, or services that wishes to:

- understand the overall context within which the organization operates;
- identify critical objectives;
- understand barriers, risks, and disruptions that may impede critical objectives;
- evaluate residual risk and risk tolerance to understand outcomes of controls and mitigation strategies;
- plan how an organization can continue to achieve its objectives should a disruptive incident occur;
- develop incident and emergency response, continuity response and recovery response procedures;
- define roles and responsibilities, and resources to respond to an incident;
- meet compliance with applicable legal, regulatory, and other requirements;
- provide mutual and community assistance;

- interface with first responders and the media;
- promote a cultural change within the organization that recognizes that risk is inherent in every decision and activity and must be effectively managed.

ISO/PAS 22399:2007 presents the general principles and elements for incident preparedness and operational continuity of an organization. The extent of the application will depend on factors such as the policy of the organization, the nature of its activities, products and services, and the location where and the conditions under which it functions. ISO/PAS 22399:2007, however, excludes specific emergency response activities following an incident, such as disaster relief and social infrastructure recovery that are primarily to be performed by the public sector in accordance with relevant legislation. It is important, however, that coordination with these activities be maintained and documented." (**ISO,** *ISO/PAS 22399*, 2007)

Isobar: "A line represented on a map or chart, connecting points on the surface that have equal barometric pressure over a given time or period." (**UNDHA**, *DM Gloss.*, 1992, 47; cites OFDA)

Isolation: "Definition: Isolation refers to the separation of persons who have a specific infectious illness from those who are healthy and the restriction of their movement to stop the spread of that illness. Isolation allows for the focused delivery of specialized health care to people who are ill, and it protects healthy people from getting sick. In sum, isolation is for treatment of a known illness and quarantine is for observation of possible exposure to an agent." (**DHS**, *Lexicon; Terms and Definitions*, October 19, 2007, p. 21)

Isolation and Quarantine: "Individuals who are ill, exposed, or likely to be exposed are separated, movement is restricted, basic necessities of life are available, and their health is monitored in order to limit the spread of a newly introduced contagious disease (e.g., pandemic influenza). Legal authority for those measures is clearly defined and communicated to all responding agencies and the public. Logistical support is provided to maintain measures until danger of contagion has elapsed." (**DHS**, *National Preparedness Guidelines*, 2007, p. 9)

ISP: Independent Study Program, FEMA Emergency Management Institute.

ISR: Intelligence, Surveillance, and Reconnaissance.

Issues Management Communication: "Issues management communication is similar to crisis communication; however, the organization has the luxury of foreknowledge of the impending crisis and the opportunity, to some extent, to choose the timing of its revelation to stakeholders and the public and reveal the organization's plan to resolve the issue. Again, the organization is central to the event." (**CDC**, *Crisis and Emergency Risk Communication*, 2002, p. 5)

Johannesburg Plan of Implementation (World Summit on Sustainable Development, 2002): "In September 2002, representatives of 191 governments gathered in Johannesburg for the World Summit on Sustainable Development (WSSD). The aim was to examine progress in achieving the outcomes of the 1992 Earth Summit, and to reinvigorate global commitment to sustainable development. The result was a 54-page agreement called the *Johannesburg Plan of Implementation* which sets out new commitments and priorities for action on sustainable development in areas as diverse as poverty eradication, health, trade, education, science and technology, regional concerns, natural resources and institutional arrangements. Paragraph 37 (IV. Protecting and managing the natural resource base of economic and social development) states the need for: *An integrated, multi-hazard, inclusive approach to address vulnerability, risk assessment and disaster management, including prevention, mitigation, preparedness, response and recovery, is an essential element of a safer world in the 21st century.* The paragraph has several action points including: (d) *Reduce the risks of flooding and drought in vulnerable countries by, inter alia, promoting* ***wetland and watershed protection*** *and restoration, improved land-use planning, improving and applying more widely techniques and methodologies for assessing the potential adverse effects of climate change on wetlands and, as appropriate, assisting countries that are particularly vulnerable to these effects*." (WWF, Natural Security, 2008, p. 104)

John Warner National Defense Authorization Act (Public Law 109-364, 120 Stat. 2083, Section 1076): "…authorizes the President to employ the armed forces to 'restore public order and enforce the laws of the United States" during a "serious public health emergency…'." (**ACLU**, *Pandemic Preparedness*, 2008, 31)

"President Bush left no doubt as to what he thought should be done regarding this particular issue of federalism [disagreement with Governor Blanco of Louisiana on placement of incident management ultimate authority following Hurricane Katrina]. At a speech two weeks later in New Orleans and at a press conference a few days after that, the president called on Congress to give him the authority to use the military for all forms of disaster response (including natural disasters, and including local law enforcement powers) anywhere in the country anytime he deemed it necessary. He also wanted the ability to use these powers whether the governors of the

affected states asked for it and agreed to it or not (Sanger, 2005)[78]…. In the autumn of 2006, one of the final legislative actions of the out-going Republican-led Congress was a little-notice rider to a defense appropriations bill giving the president just the authority he had requested (P.L. 109-364, § 1076). However, a strong negative reaction to this provision by state governors led to its repeal just over a year later (P. L. 110-181, 2008 National Defense Authorization Act, § 1068)." (**Burton**, "The Constitutional Roots of All-Hazards Policy, Management, and Law," 2008, 8)

Joint Advisory Committee on Communications Capabilities of Emergency Medical and Public Health Care Facilities: "The Joint Advisory Committee on Communications Capabilities of Emergency Medical and Public Health Care Facilities (JAC) was created by Congress to examine the communications capabilities and needs of emergency medical and public health care facilities. Specifically, the Joint Advisory Committee is charged with assessing:
1. Specific communications capabilities and needs of emergency medical and public health care facilities, including the improvement of basic voice, data, and broadband capabilities;
2. Options to accommodate growth of basic and emerging communications services used by emergency medical and public health care facilities; and
3. Options to improve integration of communications systems used by emergency medical and public health care facilities with existing or future emergency communications networks." (JAC, *Report to Congress*, February 4, 2008, p. 4)

Joint Analysis Center (JAC) DHS: "Staffed with personnel from the Departments of Defense, Energy, Homeland Security, the Federal Bureau of Investigation and the Nuclear Regulatory Commission, the Joint Analysis Center (JAC) will provide status tracking for the United States Government Global Nuclear Detection Architecture. With a direct conduit from the alarm source to national assets for spectrum analysis, the Joint Analysis Center will provide 24/7 response for radiological alarm resolution and provide the capability to marry intelligence, illicit activity, and threats with a known radiological architecture that will provide total situational awareness to decision makers. The JAC facilitates the USG Interagency Nuclear Decision Protocols to adjudicate nuclear detection events.

"*Situational Awareness*: The JAC achieves situational awareness through visibility into deployed components, access to information, and historical data. Information is received from deployed radiological/nuclear detection assets, radiological/nuclear related events, the global nuclear detection architecture, the NRC and Agreement State Material Licensing Data, and historical data on all detection events, illicit and legitimate." (**DHS**, *DNDO: JAC*, 2007)

Joint Coordination Group: "The term Unified Coordination Group replaces the term Joint Coordination Group described in the *NRP*. The JFO is led by the Unified Coordination Group, which is comprised of specified senior leaders representing State and Federal interests, and in certain circumstances tribal governments, local jurisdictions, the private sector, or NGOs." (**DHS**, *NRF FAQs*, Jan 2008, 6)

[78] Sanger, David, 2005. Bush Wants to Consider Broadening of Military's Powers During Natural Disasters, *New York Times*, September 27, p. A18.

Joint Field Office (JFO): "The JFO is the primary Federal incident management field structure. The JFO is a temporary Federal facility that provides a central location for the coordination of Federal, State, tribal and local governments and private sector businesses and NGOs with primary responsibility for response and short-term recovery. The JFO structure is organized, staffed and managed in a manner consistent with *NIMS* principles and is led by the Unified Coordination Group. Personnel from Federal and State departments and agencies, other jurisdictional entities and private sector businesses and NGOs may be requested to staff various levels of the JFO, depending on the requirements of the incident. When incidents impact the entire nation or multiple States or localities, multiple JFOs may be established. In these situations, coordination will occur following the principles of Unified Area Command. The physical location of such a coordination entity depends on the situation. As the primary field structure, the JFO provides the organizing structure to integrate diverse Federal authorities and capabilities and coordinate Federal response and recovery operations. For additional information on staffing and procedures, see the JFO Standard Operating Procedure.26 The JFO is internally organized and operated using the concepts and principles of the *NIMS* Incident Command System." (**DHS** *National Response Framework* **(**Comment Draft), 2007, p. 61)

Joint Field Office (JFO): "A temporary Federal facility established locally to provide a central point for Federal, State, local, and tribal executives with responsibility for incident oversight, direction, and/or assistance to effectively coordinate protection, prevention, preparedness, response, and recovery actions. The JFO will combine the traditional functions of the JOC, the FEMA DFO and the JIC within a single Federal facility." (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 2007, p. 54)

Joint Field Office (JFO): "The JFO is a multiagency coordination center established at the field level. The JFO is the primary hub for coordination of Federal, state, local, tribal, private, and nongovernmental organizations to manage the CBRNE incident. The JFO is a temporary Federal facility established locally to coordinate operational Federal assistance activities to the affected jurisdiction(s) during incidents of national significance. Other Federal operations centers or operational entities, to include the JTF headquarters, also collocate at the JFO whenever possible. In the event collocation is not practical, the JTF headquarters will be connected virtually to the JFO and will assign liaisons to the JFO to facilitate the coordination of Federal incident management and assistance efforts. There are three organization components within the JFO — the coordination group, coordination staff, and sections." (**JCS/DOD**, *CBRNE CM*, 2006, II-17)

Joint Field Office (JFO): "A temporary Federal facility established locally to provide a central point for Federal, State, local, and tribal executives with responsibility for incident oversight, direction, and/or assistance to effectively coordinate protection, prevention, preparedness, response, and recovery actions. The JFO will combine the traditional functions of the JOC, the FEMA DFO, and the JIC within a single Federal facility." (**USCG**, *IM Handbook*, 2006, Glossary 25-13)

Joint Field Office (JFO) Commander: "Based on the complexity and type of incident, and the anticipated level of DOD resource involvement, DOD may elect to designate a JTF to command Federal (Title 10) military activities in support of the incident objectives. If a JTF is established, consistent with operational requirements, its command and control element will be co-located

with the senior on-scene leadership at the JFO to ensure coordination and unity of effort. The co-location of the JTF command and control element does not replace the requirement for a DCO/Defense Coordinating Element as part of the JFO Unified Coordination Staff. The DCO remains the DOD single point of contact in the JFO for requesting assistance from DOD. The JTF Commander exercises operational control of Federal military personnel and most defense resources in a Federal response. Some DOD entities, such as the U.S. Army Corps of Engineers, may respond under separate established authorities and do not provide support under the operational control of a JTF Commander. Unless federalized, National Guard forces remain under the control of a State Governor. Close coordination between Federal military, other DOD entities, and National Guard forces in a response is critical." (**DHS**, *NRF*, 2008, 68-69)

Joint Field Office (JFO) Coordination Group. "The JFO Coordination Group directs the JFO's activities. The following officials typically comprise the group.

- **Principal Federal Official (PFO).**
- **Federal Coordinating Officer (FCO).**
- **Federal Resource Coordinator (FRC).**
- **Senior Federal Officials (SFOs).**
- **Senior Federal Law Enforcement Official (SFLEO).**
- **State/Local/Tribal Official(s).**" (DHS, 2007)

Joint Field Office Coordination Group: "Consists of the PFO, the Federal coordinating officer (FCO), the state coordinating officer (SCO), other senior Federal officials such as the senior Federal law enforcement officer, and possibly other nongovernmental and private-sector representatives. If a JTF is established by the CCDR [Combatant Commander], consistent with operational requirements, its C2 [Command and Control] element will be collocated with the PFO at the JFO to ensure coordination and unity of effort. The PFO has no direct authority over other officials, but represents the Secretary of Homeland Security as the lead Federal official. The PFO ensures overall coordination of Federal domestic incident management and resource allocation activities; ensures seamless integration of Federal activities in support of and in coordination with state, local, and tribal requirements; provides strategic guidance to Federal entities; facilitates interagency conflict resolution as necessary; serves as a primary point of contact for Federal interface with state, local, and tribal senior elected/appointed officials, the media, and the private sector; provides real-time incident information to the Secretary of Homeland Security through the NOC and the IAC as required; coordinates response resource needs between multiple incidents as necessary or as directed by the Secretary of Homeland Security; coordinates the overall Federal public communications strategy locally to ensure consistency of Federal interagency communications to the public; and ensures that adequate connectivity is maintained between the JFO and the NOC; local, county, state, and regional EOCs; nongovernmental EOCs and relevant elements of the private sector. The FCO conducts an initial appraisal of the types of assistance most urgently needed; coordinates the timely delivery of Federal assistance to affected state, local, and tribal governments and disaster victims; supports the PFO; administers the financial aspects of assistance authorized under the Stafford Act; works in partnership with the SCO; and takes other action consistent with the authority delegated to him or her as deemed necessary to assist local citizens and public officials in promptly obtaining assistance to which they are entitled. The SCO is the state's counterpart to

the FCO, managing the state's incident management programs and activities." (**JCS/DOD**, *CBRNE Consequence Management* (JP 3-41), 2006, p. II-19) [Note: See "Joint Field Office Unified Coordination Group,"]

Joint Field Office Coordination Staff: "The JFO coordination staff provides specialized assistance to the JFO. The DCO is the single point of contact from DOD in the JFO for civil support. The defense coordinating element (DCE) is the DCO's staff. The DCO with the DCE processes requirements for military support; forwards mission assignments to the appropriate military organizations through DOD channels; and assigns military liaisons to activated ESFs, as appropriate. The collocation of the JTF C2 element does not replace the requirement for a DCO/DCE as part of the JFO coordination staff and it will not coordinate requests for assistance for DOD." (JCS/DOD, CBRNE Consequence Management (JP 3-41), 2006, p. II-19)

Joint Field Office Sections: "JFO sections are established, as necessary, to meet the essential management functions of operations, planning, logistics and finance/administration.

a. The *operations section* coordinates operational support to on-scene incident management efforts. Branches may be added or deleted as required, depending on the nature of the incident. The operations section also is responsible for coordination with other Federal command posts that may be established to support incident management activities. The 15 ESFs provide staff and resources to the sections of the JFO, principally the operations section, consistent with the purpose and scope defined in the NRP annexes. A joint force conducting CBRNE CM should be aware of their activities through the DCO. The joint force conducting CBRNE CM will not typically be involved with law enforcement activities…

b. The *planning section* collects, evaluates, disseminates, and uses information regarding the threat or incident and the status of Federal resources. It is also responsible for preparing and documenting Federal support actions, and developing strategic, contingency, long-term, and other plans related to the threat or incident, as needed. The planning section provides current information to the JFO coordination group to ensure situational awareness, determine cascading effects, identify national implications, and determine specific areas of interest requiring long-term attention. The planning section also provides technical and scientific expertise.

c. The *logistics section* coordinates the logistic response of the Federal Government to the entire disaster area and coordinates closely with the state and local officials for Federal supplies and equipment; resource ordering; delivery of equipment, supplies, and services to the JFO and other field locations; and transportation coordination and fleet management services.

d. The *finance/administration section* is responsible for the financial management, monitoring, and tracking of all Federal costs relating to the incident and the functioning of the JFO while adhering to all Federal laws, acts, and regulations." (**JCS/DOD**, *CBRNE CM*, 2006, II-19-21)

Joint Field Office Unified Coordination Group: "The Joint Field Office Unified Coordination Group—consisting of the Principal Federal Official (if designated), the Federal Coordinating Officer, the State Coordinating Officer, and the DHS Infrastructure Protection senior Federal official—serves as the Unified Command for all disaster operations in the respective states. All

State requests for Federal support are staffed and coordinated through the Operations Section for this group. Additionally, this group is charged with the integration and coordination of all Federal support—the Stafford Act as well as the unique authorities of other Federal departments — involved in the disaster. The Joint Field Office Unified Coordination Group, through the Joint Field Office, also provides directional control for all Federal field activities including but not limited to: Federal Operational Staging Areas, Disaster Recovery Centers, the United States Army Corps of Engineers (USACE), and other departments' field operations. Based on the circumstances, the Joint Field Offices may establish one or more Area Field Offices (AFOs) to provide responsive support. All Area Field Offices will report directly to their respective Joint Field Offices." (F**EMA**, *Federal Interim Contingency Plan – Predecisional Draft: NMSZ*, December 15, 2007, pp. 21-22)

Joint Force Headquarters Joint Operations Centers (JFHQ JOC): "The JOC is a network composed of the National Guard Bureau JOC, located in Arlington, Virginia and a separate JOC in each of the 54 States and Territories. The JFHQ JOC serves as the primary entity for coordinating, facilitating, and synchronizing efforts in support of their states, information requirements of the National Guard Bureau and customers at the Federal level during natural disasters, National Special Security Events (NSSE), exercises and domestic activities." (**Blum**, July 19, 2007, p. 5)

Joint Force Headquarters – State (National Guard): "JFHQ-State is a joint command and control entity in each State and territory. It is integrated into national consequence management and contingency planning structures. JFHQs provide situational updates (common operating picture) information to national level headquarters before and during any contingency operation and Joint Reception, Staging, and Onward Movements, and Integration (JRSOI) for all inbound military forces…. created in times of emergency by the Joint Force Headquarters." (**Blum**, July 19, 2007, p. 4)

Joint Housing Solutions Group (JHSG): "In 2006, FEMA…launched a Joint Housing Solutions Group (JHSG) charged with identifying viable alternatives to FEMA travel trailers and manufactured homes, and recommending improvements for conducting disaster housing operations. The Joint Housing Solutions Group has developed housing evaluation criteria, a Housing Assessment Tool, and screened, tested and rated more than 100 alternative housing providers and their products ranging from panelized, manufactured, and modular homes to shipping container prototypes. In October 2007, the JHSG released a one year report to identify the milestones of the JHSG Steering Committee. The next step is to pilot test select housing units in order to gauge field performance." (**FEMA**, *Statement of Glenn Cannon*, Dec. 4, 2007, p. 8)

Joint Information Center (JIC): "In order to coordinate the release of emergency information and other public affairs functions, a State or tribal government may establish a Joint Information Center (JIC), a physical location from which external affairs professionals from all the organizations involved in an incident work together. The JIC serves as a focal point for coordinated and timely release of incident-related information to the public and the media." (**DHS** *National Response Framework* (Comment Draft), 2007, p. 49)

Joint Information Center (JIC): "A central point of contact for all news media near the scene of a large-scale disaster. News media representatives are kept informed of activities and events by public information officials who represent all participating Federal, State, and local agencies that are collocated at the JIC." (**FEMA**, *Guide For All-Hazard Emergency Operations Planning* (SLG 101), 1996, pp. GLO 7-8)

Joint Information Center (JIC): "A joint information center is a physical location where public affairs professionals from organizations involved in incident management activities can colocate to perform critical emergency information, crisis communications, and public affairs functions. It is important for the center to have the most current and accurate information regarding incident management activities at all times. The center provides the organizational structure for coordinating and disseminating official information. Centers should be established at each level of incident management, as required." (**NFPA 1600**, 2007, p. 19)

Joint Information Center (JIC): "A facility established within or near the ICP where the PIO and staff can coordinate and provide information on the incident to the public, media, and other agencies. The JIC is normally staffed with representation from the FOSC, SOSC, and FO." (**USCG**, *IM Handbook*, 2006, Glossary 25-13)

Joint Information Center (JIC) Types:

- Incident
- Virtual
- Satellite
- Area
- Support
- National (**FEMA**, *Basic Guidance for PIOs (FEMA 517)*, Nov 2007, p. 16)

Joint Information System (JIS): "The JIS provides the mechanism to organize, integrate, and coordinate information to ensure timely, accurate, accessible, and consistent messaging across multiple jurisdictions and/or disciplines, including the private sector and NGOs. It includes the plans, protocols, procedures, and structures used to provide information to:

- general public;
- disaster victims;
- affected jurisdictions;
- elected officials;
- community leaders;
- private sector;
- media;
- NGOs (e.g., American Red Cross);
- response and recovery organizations (e.g., urban search and rescue, utilities);
- volunteer groups (e.g., CERT, VOAD);
- international interests (e.g., international media and donations); and
- other impacted groups." (**FEMA 517**, *Basic Guidance for PIOs*, Nov 2007, 14)

Joint Information System (JIS): **"**Integrates incident information and public affairs into a cohesive organization designed to provide consistent, coordinated, accurate, accessible, timely,

and complete information during crisis or incident operations. The mission of the JIS is to provide a structure and system for developing and delivering coordinated interagency messages; developing, recommending, and executing public information plans and strategies on behalf of the IC; advising the IC concerning public affairs issues that could affect a response effort; and controlling rumors and inaccurate information that could undermine public confidence in the emergency response effort." (**FEMA**, *NIMS* (FEMA 501/Draft), August 2007, p. 153)

Joint Information System (JIS): "Integrates incident information and public affairs into a cohesive organization designed to provide consistent, coordinated, timely information during a crisis or incident operations." (**USCG**, *IM Handbook*, 2006, Glossary 25-13/14)

Joint Interagency Coordination Group (JIACG): "In 2002, the National Security Advisor and Secretary of Defense directed that each combatant command establish a Joint Interagency Coordination Group (JIACG) in order to enhance interdepartmental coordination. As USNORTHCOM became a reality, the plankholders saw that the JIACG concept could be invaluable in building and maintaining relationships with Federal departments and agencies as well as state and local governments, nongovernmental organizations, and the private sector, all key players in homeland defense and security. The bicommand leadership established the Interagency Coordination Directorate as a primary staff directorate, "dual-hatted" to both NORAD and USNORTHCOM, to facilitate the interagency coordination process across the commands." (**Castle,** "Supporting Homeland Partners," *JFQ*, Issue 8, 1st Qtr. 2008, p. 42)

Joint Interagency Coordination Group (JIACG): "An Interagency staff group that establishes regular, timely, and collaborative working relationships between civilian and military operational planners. Composed of US Government civilian and military experts accredited to the combatant commander and tailored to meet the requirements of a supported joint force commander, the joint interagency coordination group provides the joint force commander with the capability to coordinate with other US Government civilian agencies and departments. Also called JIACG." (**JCS/DoD**, *Civil Support* (JP 3-28), 2007, p. GL-10)

Joint Interagency Intelligence Support Element (JIISE) "The JIISE is an interagency intelligence component designed to fuse intelligence information from the various agencies participating in a response to a WMD threat or incident within an FBI JOC. The JIISE is an expanded version of the investigative/intelligence component which is part of the standardized FBI command post structure. The JIISE manages five functions including: security, collections management, current intelligence, exploitation, and dissemination." (**FBI**, *USG Interagency Domestic Terrorism CONPLAN*, 2001, B-3)

Joint Logistics Advisory Council Strategy: "DHS/FEMA Headquarters Logistics in coordination with appropriate ESFs will selectively employ Joint Advisory Councils consisting of public/private-sector partnerships to establish and maintain robust incident supply chains. For select commodities, such as difficult-to-source and/or life-saving/life-sustaining supplies, DHS/FEMA Headquarters Logistics will solicit private-sector input on better ways to source and deliver materiel and services." (**DHS**, *NRF Logistics Management Support Annex*, 2007, p. 7)

Joint Operations Center (JOC). "The JOC is an interagency command post established by the FBI to manage terrorist threats or incidents and investigative and intelligence activities. The JOC coordinates the necessary interagency law enforcement assets required to prepare for, respond to and resolve the threat or incident with State, tribal and local law enforcement agencies." (**DHS** *NRF Comment Draft*, 2007, p. 62; see, also, **DHS**, NRF, 2008, 65))

Joint Operations Center (JOC): "The JOC is the focal point for all Federal investigative law enforcement activities during a terrorist or potential terrorist incident or any other significant criminal incident, and is managed by the SFLEO. The JOC becomes a component of the JFO when the NRP is activated." (**USCG**, *IM Handbook*, 2006, Glossary 25-14)

Joint Operations Planning and Execution System (JOPES): "The Joint Operations Planning and Execution System (JOPES) is the Department of Defense's (DoD's) principal means for translating national security policy decisions into military plans and operations." (**USJFCOM**, *Joint Operation Planning and Execution System*)

Joint Reception, Staging, and Onward Movements, and Integration (JRSOI): "In very simplistic terms, JRSOI is simply a selection of predetermined sites (distribution points, airports etc.) and routes for moving supplies and personnel into affected areas." (**Blum**, 19July2007, 10)

Joint Regional Information Exchange System (JRIES): "…originally developed by state and local authorities in partnership with the federal government…this system allows all states and major urban areas to collect and disseminate information between federal, state, and local agencies involved in combating terrorism." (**DHS**, *DHS Implements Information Exchange System for G-8 Summit Events*, May 28, 2004)

"JRIES is a counterterrorism communications program founded and managed in conjunction with state and local governments, counterterrorism authorities, and law enforcement agencies. At the request of state and local partners, this platform has been adopted by Homeland Security as the system of choice for information sharing between DHS partners as part of the Homeland Security Information Network. JRIES provides real-time collaboration and advanced analytic capabilities." (**DHS**, *Homeland Security Launches Expansion of Information Exchange System to States and Major Cities*, February 24, 2004)

Joint Task Force (JTF). "Based on the magnitude, type of incident and anticipated 1 level of resource involvement, the combatant commander may utilize a JTF to command Federal military forces in support of the incident response. If a JTF is established, consistent with operational requirements, its command and control element will be co-located with the senior DHS on-scene leader at the JFO to ensure coordination and unity of effort. The co-location of the JTF command and control element does not replace the requirement for a Defense Coordinating Officer (DCO)/Defense Coordinating Element as part of the JFO Unified Coordination Staff. The DCO remains the Department of Defense (DOD) single point of contact in the JFO for requesting assistance from DOD." (**DHS**, *NRF Comment Draft*, September 2007, p. 63)

Joint Task Force Civil Support (JTF-CS): "JTF-CS is a standing JTF assigned to CDRUSNORTHCOM dedicated to planning and integrating DOD domestic CBRNE consequence management support for incidents or accidents. When directed by SecDef,

CDRUSNORTHCOM [Commander NORTHCOM] deploys JTF-CS as a CBRNE CM headquarters to establish C2 [Command and Control] of designated DOD forces at the CBRNE incident site and to provide CS to save lives, prevent injury, and provide temporary critical life support. If the CBRNE event occurs outside the USNORTHCOM AOR, JTF-CS may be attached to CDRUSPACOM or CDRUSSOUTHCOM to provide domestic CBRNE support." (**JCS/DoD**, *Civil Support*, 2007, p. II-9)

Joint Task Force (JTF) Commander. "Based on the complexity and type of incident, and the anticipated level of DOD resource involvement, DOD may elect to designate a JTF to command Federal (Title 10) military activities in support of the incident objectives. If a JTF is established, consistent with DOD operational requirements, its command and control element will establish effective liaison with the JFO to ensure coordination and unity of effort. The JTF Commander exercises operational control of all allocated DOD resources (excluding U.S. Army Corps of Engineers resources). National Guard forces operating under a Governor's control are not DOD-controlled resources. The use of a JTF does not replace the requirement for a Defense Coordinating Officer as part of the JFO Coordination Staff. The JTF does not coordinate requests for assistance from DOD." (**DHS**, *NRF Comment Draft*, September 2007, p. 65)

Joint Task Force Consequence Management: "…Joint Task Force Consequence Management East (headquartered at Fort Gillem, Georgia) and Joint Task Force Consequence Management West (headquartered at Fort Sam Houston, Texas), is a deployable, standing task force of 160 assigned military personnel led by a two-star Army National Guard general officer serving on active duty, who is under the command of the U.S. Northern Command (USNORTHCOM) commander. The mission of JTF-CS is to deploy, when directed, to a CBRNE incident site to exercise command and control of assigned Federal military forces to support civil authorities." (**DoD**, *Statement of Verga*, July 19, 2007, pp. 5-6)

Joint Terrorism Task Forces (JTTF): "Joint Terrorism Task Forces (JTTFs) are small cells of highly trained, locally based, passionately committed investigators, analysts, linguists, SWAT experts, and other specialists from dozens of U.S. law enforcement and intelligence agencies. It is a multi-agency effort led by the Justice Department and FBI designed to combine the resources of federal, state, and local law enforcement. The National JTTF was established in July 2002 to serve as a coordinating mechanism with the FBI's partners. Some 40 agencies are now represented in the NJTTF, which has become a focal point for information sharing and the management of large-scale projects that involve multiple partners." (**DOJ**, *JTTF*, 2006)

Joint Training System (JTS) JCS: "The development and promulgation of the Joint Training System in 1994, by Chairman of the Joint Chiefs of Staff, General Colin Powell, was then and arguably still remains **the** *re-engineering joint training* effort within the Department of Defense. Even-though General Powell's successors, including the current Chairman, have not used the "re-engineering" phrase – their intent has been consistent and clearly focused precisely on what some have now termed *re-engineering joint training*. Department of Defense (DoD) Transformation Policy, and its center-piece, Training Transformation (T2), has not replaced the re-engineering joint training objective. Instead, the T2 Policy crystallized the re-engineering focus and accelerated the impetus for cultural change across the Department. Now, the Joint Training System provides the basis for training implementation throughout the entire Department

of Defense. The Secretary of Defense directed that, "The Joint Training System will be refined, fully implemented, and used to manage training throughout the Department.[79]

"Evolving the joint preparation of the Armed Forces of the United States remains the sole overarching objective for all processes that define the Joint Training System (JTS). The focus for the process has transitioned from a historical *events-based* approach to a *requirements-based* framework for affecting the joint training of individuals, staffs, units, and forces. The Chairman of the Joint Chiefs of Staff (CJCS), as well as the Service Chiefs, combatant commanders and other senior officials, determined that the new world order's challenges demanded breaking the paradigm of *event-based training* that had predominantly defined joint preparation before the first Gulf War. The implementation of the Joint Training System in 1998 marked the first training cycle in which combatant command joint training events were accomplished based on the requirements identified, and a command Joint Training Plan developed, using the processes of the Joint Training System.

"The core elements of the Joint Training System -- mission capability-based requirements, a common joint language, performance-based evaluation against pre-determined mission-oriented standards, and readiness assessment more clearly linked to mission requirements -- have since not only been embraced within the training environment but have been adopted by many other governmental entities and functionalities. They are now at the heart of preparation and readiness assessment policy throughout the Department of Defense and beyond. This holistic, warfighting requirements-based approach not only supports the CJCS intent for re-engineering joint training but affirms its effectiveness." (**JCS**, DoD, *Required Training Capabilities for Joint Force Commanders "Re-engineering Joint Training" Study*, Joint Staff J7, Joint Training Div. Draft)

JumpSTART: "The JumpSTART Pediatric MCI Triage Tool is…[an] objective tool developed specifically for the triage of children in the multicasualty/disaster setting. JumpSTART was developed in 1995 to parallel the structure of the START system, the adult MCI triage tool most commonly used in the United States and adopted in many countries around the world. JumpSTART's objectives are:

1) to optimize the primary triage of injured children in the MCI setting
2) to enhance the effectiveness of resource allocation for *all* MCI victims
3) to reduce the emotional burden on triage personnel who may have to make rapid life-or-death decisions about injured children in chaotic circumstances

JumpSTART provides an objective framework that helps to assure that injured children are triaged by responders using their heads instead of their hearts, thus reducing overtriage that might siphon resources from other patients who need them more and result in physical and emotional trauma to children from unnecessary painful procedures and separation from loved ones. Undertriage is addressed by recognizing the key differences between adult and pediatric physiology and using appropriate pediatric physiologic parameters at decision points.

JumpSTART has rapidly gained acceptance by EMS agencies and hospitals throughout the US and Canada and is being taught in numerous countries internationally. The tool has been recognized for use by groups such as the US National Disaster Medical System's federal medical response teams and EMS providers in the National Park Service. JumpSTART is referenced in numerous EMS and disaster texts and has been incorporated into courses such as Pediatric Disaster Life Support (PDLS) and Advanced Pediatric Life Support (APLS).

…JumpSTART was designed for use in disaster/multicasualty settings, not for daily EMS or hospital triage. The triage philosophies in the two settings are different and require different guidelines… JumpSTART is also intended for the triage of children with acute injuries and may not be appropriate for the primary triage of children with medical illnesses in a disaster setting. Note also that no MCI triage tool, including START and JumpSTART, has been clinically or scientifically validated at the time of publication of this website." (**Romig**, *The JumpSTART Pediatric MCI Triage Tool,* August 7, 2006 Revision)

Justice: "Preparation for a potential pandemic (or any disaster) should ensure a fair distribution of the benefits and burdens of precautions and responses and equal respect for the dignity and autonomy of each individual." (**ACLA**, *Pandemic Preparedness*, 2008, 7)

JWARN: Joint Warning and Reporting Network. (**DA**, *WMD-CST Operations*, 2007, Glossary-4)

Kaizen: Japanese word meaning "continuous improvement." (**WY Environmental Quality Dept**.)

Key Resources: "As defied in the Homeland Security Act [2002], 'key resources' are publicly or privately controlled resources essential to the minimal operations of the economy and government." (**DHS**, *National Infrastructure Protection Plan*, 2006, p. 104)

KI: Potassium Iodide.

Kiloton: Thousand tons of TNT. (**Glasstone**, *The Effects of Nuclear Weapons*, 1977, 2)

Kind (NIMS Resource Typing): "Kind refers to broad classes that characterize like resources, such as teams, personnel, equipment, supplies, vehicles, and aircraft." (FEMA, *National Incident Management System* (FEMA 501/Draft). Washington, DC: August 2007, p. 41)

Kirkpatrick Learning and Training Evaluation Model: "The four levels of Kirkpatrick's evaluation model essentially measure:

- reaction of student - what they thought and felt about the training
- learning - the resulting increase in knowledge or capability
- behaviour - extent of behaviour and capability improvement and implementation/application
- results - the effects on the business or environment resulting from the trainee's performance." (**Businessballs.com**. "Kirkpatrick's Learning and Training Evaluation Theory")

Knowledge Structure: "Three types of knowledge structures are declarative, procedural, and strategic. *Declarative knowledge* tells us why things work the way they do, or that an object or thing has a particular name or location. It includes information about the concepts and elements in the domain and the relationships between them. *Procedural knowledge* tells how to perform a given task. It contains the discrete steps or actions to be taken and the available alternatives when performing a given task. With practice, procedural knowledge can become an automatic process, thus allowing people to perform tasks without conscious awareness. *Strategic knowledge* is composed of information that is the basis of problem solving, such as action plans to meet specific goals, knowledge of the context in which procedures should be implemented, actions to be taken if a proposed solution fails, and how to respond if necessary information is absent." (**DHS**, *DHS Training Glossary*, 2006, p. 32)

KSAs: Knowledge, Skills, and Ability.

KT: Kiloton. (**OCD**, *Abbreviations and Definitions*, 1971, p. 3)

Kyoto Protocol: "The Kyoto Protocol was adopted at the Third Session of the Conference of the Parties (COP) to the UN Framework Convention on Climate Change (UNFCCC) in 1997 in

Kyoto, Japan. It contains legally binding commitments, in addition to those included in the UNFCCC. Countries included in Annex B of the Protocol (most OECD countries and EITs) agreed to reduce their anthropogenic emissions of greenhouse gases (CO2, CH4, N2O, HFCs, PFCs, and SF6) by at least 5 % below 1990 levels in the commitment period 2008 to 2012." (European Environment Agency, EEA Environmental Glossary; cites: **IPCC**, *Climate change 2001 Impacts, Adaptation and Vulnerability*.)

L: Lewisite. (**DA**, *WMD-CST Operations*, December 2007, Glossary-4)

La Niña: The opposite of an El Niño event, during which waters in the west Pacific are warmer than normal, trade winds or Walker circulation is stronger and, consequently, rainfalls heavier in Southeast Asia. (**Bryant** 1991)

Laboratory Response Network: "The Laboratory Response Network (LRN) was established by the Department of Health and Human Services, Centers for Disease Control and Prevention (CDC) in accordance with Presidential Decision Directive 39, which outlined national anti-terrorism policies and assigned specific missions to federal departments and agencies. Through a collaborative effort involving LRN founding partners, the Federal Bureau of Investigation and the Association of Public Health Laboratories, the LRN became operational in August 1999. Its objective was to ensure an effective laboratory response to bioterrorism by helping to improve the nation's public health laboratory infrastructure, which had limited ability to respond to bioterrorism. Today, the LRN is charged with the task of maintaining an integrated network of state and local public health, federal, military, and international laboratories that can respond to bioterrorism, chemical terrorism and other public health emergencies. The LRN is a unique asset in the nation's growing preparedness for biological and chemical terrorism. The linking of state and local public health laboratories, veterinary, agriculture, military, and water- and food-testing laboratories is unprecedented. In the years since its creation, the LRN has played an instrumental role in improving the public health infrastructure by helping to boost laboratory capacity. Laboratories are better equipped, their staff levels are increasing, and laboratories are employing advanced technologies." (**CDC**, *The Laboratory Response Network*, 2005)

LAC: Local Assistance Center. (**EG&G**, *San Diego County Firestorms AAR 2007*, Feb 08, v)

Lahar: "A term originating in Indonesia, designating a debris flow over the flank of a volcano." (**UNDHA**, *Disaster Management Glossary*, 1992, p. 48)

Land Degradation: "Progressive deterioration of land quality or land forms resulting from natural phenomena or human activity." (**UNDHA**, *Disaster Mgmt. Glossary*, 1992, p. 48)

Landslide: "Landslides occur in all U.S. states and territories. In a landslide, masses of rock, earth, or debris move down a slope. Landslides may be small or large, slow or rapid. They are activated by storms, earthquakes, volcanic eruptions, fires, and human modification of land.

Debris and mud flows are rivers of rock, earth, and other debris saturated with water. They develop when water rapidly accumulates in the ground, during heavy rainfall or rapid snowmelt, changing the earth into a flowing river of mud or "slurry." They can flow rapidly, striking with

little or no warning at avalanche speeds. They also can travel several miles from their source, growing in size as they pick up trees, boulders, cars, and other materials." (**FEMA**, "Fact Sheet – Land Slide," June 2007, p. 1)

Landslide: "In general, all varieties of slope movement, under the influence of gravity. More strictly refers to down-slope movement of rock and/or earth masses along one or several slide surfaces." (**UNDHA**, *Disaster Management Glossary*, 1992, p. 48)

Landslide: "A mass movement of soil, mud, and (or) rock down a slope." (**USGS**, *Putting Down Roots in Earthquake Country*, 2007, Glossary)

Landslide Stabilization: "Measures to prevent a landslide." (**UNDHA**, *DM Glossary*, 1992, 49)

Land Use Planning: "Branch of physical and socio-economic planning that determines the means and assesses the values or limitations of various options in which land is to be utilized, with the corresponding effects on different segments of the population or interests of a community taken into account in resulting decisions.

Land-use planning involves studies and mapping, analysis of environmental and hazard data, formulation of alternative land-use decisions and design of a long-range plan for different geographical and administrative scales. Land-use planning can help to mitigate disasters and reduce risks by discouraging high-density settlements and construction of key installations in hazard-prone areas, control of population density and expansion, and in the siting of service routes for transport, power, water, sewage and other critical facilities." (**UN/ISDR,** *Terminology: Basic Terms of Disaster Risk Reduction*, March 31, 2004)

LANL: Los Alamos National Laboratory.

Lateral and Multi-Level Coordination: "To be evaluated as fully-qualified, the jurisdiction shall have demonstrated a capability for lateral and multi-level operations and coordination, in addition to operations and coordination needed within it's own boundaries and relating to its own emergency forces. Means for developing and demonstrating this capability may include: (1) Two-community total-system exercises (e.g., involving use of mutual-assistance plans that were jointly developed); (2) local to next higher EOC exercise (e.g., city-county, or county State Area, using reporting systems specified by the State); or (3) local-State-Regional (or local-State-Regional- National) exercises, such as the "CDEX" exercises." (**DCPA**, *Standards For Local Civil Preparedness*, 1978, p. 36)

Lava Flow: "Molten rock which flows down-slope from a volcanic vent, typically moving at between a few metres to several tens of kilometres per hour." (**UNDHA**, *DM Glossary* 1992, 49)

Law and Order, Maintenance of: "OCDM's primary emphasis on this responsibility during FY 1960 was to provide technical information and guidance to State and local governments. The objective is to help them develop the capability of maintaining law and order under emergency conditions requiring actions uncommon to normal police activities; e.g., control of mass movement; prevention and control of panic, mob action, crimes of violence, looting, and

vandalism; maintenance of order in reception areas; and protection of vital installations and supplies." (**OCDM**, *Annual Report 1960*, p. 22)

Law Enforcement (LE): "Individuals who, on a full-time, part-time, or voluntary basis, work for agencies at the local, municipal, and State levels with responsibilities as sworn law enforcement officers." (**FEMA**, *TEI/TO Course Catalog*, 2008, 3)

Law Enforcement Agencies in the U.S.: "There are 17,784 law enforcement agencies spread across Federal, State, and local levels of government." (**DHS**, Chap. 2, *Draft DHS Pub 1*, 08, 2)

Law Enforcement Domain Working Group: "This working group includes federal, state, local, and tribal entities, and those activities which support both the enforcement of criminal and civil laws, and the other operational responsibilities and authorities of these entities." (**DHS**, *Fact Sheet: National Applications Office*, August 15, 2007)

Law Enforcement Terrorism Prevention Program (LETPP). See Department of Homeland Security, LETPP.

Layered Approach: "We also believe in layered security. That's recognition of the fact that there's no magic bullet for security, whether it be our ports or elsewhere. Any single approach can fail. Therefore, the right answer is to build layers of security that build rings of protection. What that does is it counts on redundancy and on randomness as allies in building a total security network." (**DHS**, *Remarks by Homeland Security Secretary Michael Chertoff to the American Association of Port Authorities*, March 20, 2007)

Layered Approach: "I think our general philosophy on taking a layered approach is not to put all our eggs in one basket but to have vigorous intelligence and vigorous prevention, but also be prepared to have a process in place and a response in place if there is an attack. It could even come from a single individual; it doesn't need to come from a terrorist group. So I think we need to do the full menu of approaches." (**DHS**, *Testimony of Secretary of Homeland Security Michael Chertoff Before the House Homeland Security Committee*, July, 14, 2005)

Layered Security: "Our posture is one of 'layered security'--pushing our borders continuously outward from American shores." (**DHS**, *Remarks by Secretary of Homeland Security Tom Ridge at the Port of Portland*. May 4, 2004)

Layered System: "We have significantly bolstered our nation's security by implementing a layered system of protections along our borders and at our ports of entry, on our roadways, railways, and waterways, and even far from our borders and shores." (**DHS**, *Remarks by* [DHS Secretary] *Tom Ridge Before the House Select Committee on Homeland Security*, 14 Sep 2004)

LC: Logistics Center. (**DHS**, *NRF Logistics Management Support Annex*, Sep. 2007. p. 2)

LC50: "Lethal concentration 50. The concentration of a material administered by inhalation that is expected to cause the death of 50% of an experimental animal population within a specified

time. (Concentration is reported in either ppm or mg/m3)." (**DOT**, Emergency *Response Guidebook…Hazardous Materials Incidents*, 2004, p. 362)

LD50: Lethal dose 50. Level of radiation exposure expected to cause the death of 50% of exposed population. (**OCD**, *Abbreviations and Definitions*, 1971, p. 3)

LE: Law Enforcement. (**FEMA**, *TEI/TO Course Catalog*, 2008, 2)

Lead Evaluator: "The lead evaluator should participate fully as a member of the *exercise planning team*, and should be a senior-level individual familiar with: *prevention*, *protection*, *response*, and/or *recovery* issues associated with the exercise; Plans, policies, and procedures of the exercising jurisdiction/organization; Incident Command and decision-making processes of the exercising jurisdiction/organization; and interagency and/or inter-jurisdictional coordination issues relevant to the exercise. The lead evaluator must have the management skills needed to oversee a team of *evaluators* over an extended process, as well as the knowledge and analytical skills to undertake a thorough and accurate *analysis* of all *capabilities* being tested during an exercise." (**FEMA**, *Homeland Security Exercise and Evaluation Program Glossary*, 2008)

Lead Exercise Planner: "The lead exercise planner oversees the *exercise planning team*; develops the exercise *project management timeline* and the exercise project management assignment list; assigns exercise responsibilities; provides overall guidance; and monitors the development process." (**FEMA**, *Homeland Security Exercise and Eval Pgm Glossary*, 2008)

Lead Federal Agency: "The federal agency that leads and coordinates the overall federal response to an emergency. Designation and responsibilities of a lead federal agency vary according to the type of emergency and the agency's statutory authority. Also called LFA." (**DoD**, *DOD Dictionary of Military and Related Terms*, 2007)

LEADERS: Lightweight Epidemiology Advanced Detection & Emergency Response System.

Leadership: "Leaders are needed to set priorities and keep focus." (**DHS**, *FCD 1*, Nov 2007, 3)

Leadership: "The senior decisionmakers who have been elected (e.g., the President, State governors) or designated (e.g., Cabinet Secretaries, chief executive officers) to head a branch of Government or other organization. The survivability of leadership is accomplished by physically protecting the officeholder (sheltering the individual in place or relocating him or her away from the threat area) and by developing a prioritized list of designated successors to that leadership position, who would assume the roles and responsibilities of that position in the event of the incapacitation or unavailability of the current officeholder. The designation as a successor enables an individual to act for the officeholder and exercise the powers and authorities of the officeholder's position, in the event of the officeholder's death, permanent disability, or resignation." (**DHS**, *FCD 1*, Nov 2007, P-6)

Leadership: Question: "If you were to pick the three most important character traits for an effective leader, what would those be? Answer: **Murphy:** First is to be open to, listen to, and absorb alternative ideas and perspectives, no matter how different they are from your own.

Second would be the ability to select and clearly articulate objectives and intent. And third, to have the ability to build, nurture, and support an effective, top-notch work force."

Leadership: "…California's emergency preparedness strategy is weakened by a lack of leadership. Researchers for years have highlighted California's vulnerabilities to a catastrophic earthquake. No imagination is needed to see in those forecasts the destruction that would result. And models are in place today to reduce threats and vulnerabilities, promote prevention and mitigation, and harness the capabilities and resources of public servants and the private sector to respond when called. No innovation is required to deploy those models in California. If California only relies on current practices to respond to its threats and vulnerabilities, the emergency management system will continue to fall just short of preventing the damage of recurrent flooding and fires that dominate the headlines. And in the event of a catastrophic incident – the earthquake that is projected within the lifetimes of most of the Californians living here today – too many of us will not survive." (**Little Hoover**, *Safeguarding…State*, 2007, 63)

Leadership: Leadership competencies identified in National Academy of Public Administration series on 21st Century Federal Managers:

> • cognitive ability, both raw intellectual horsepower and mental agility
> • strategic thinking skills, especially regarding application of technology to business strategy and operations
> • analytical ability, especially the ability to sort through myriad information and focus on the most relevant data
> • ability to make sound decisions in an environment of ambiguity and uncertainty
> • ability to manage in a diverse environment which includes employing various management styles given that there are three or four generations and cultures in one workplace, each dealing with work-life balance issues
> • ability to lead people not physically co-located with the manager, requiring new approaches to assigning work, communicating expectations, monitoring work products, integrating work products and assessing performance
> • ability to lead a contingent or blended workforce of contractors, permanent and temporary personnel, U.S. and local national employees, military, public health service, and others using matrix resources (that is, using personnel for their individual skills notwithstanding their permanent assignment to another organization and/or leaders).
> (**NAPA**, *Developing the Leadership Team: An Agency Guide*, December 2003, p. 3)

Leadership: "Competitive advantage goes to the organization with effective leaders at all levels. Leaders create change, and they help organizations and people navigate through change to produce results. Spurred by technology, globalization, downsizing, economics and public expectations, this is a time of change that calls for leaders. In any corner of industry or government—identifying, recruiting, developing, and selecting—must be a priority for any serious executive or manager." (**NAPA**, *Managing Succession and Developing Leadership: Growing the Next Generation of Public Service Leaders*, 1997HRM Series III)

Leadership and Management: "*Management is about coping with complexity*. It is a response to a significant development of the 20th century, namely the emergence of large, complex

organizations. Good management brings order to what would otherwise be chaos. *Leadership, by contrast, is about coping with change*. *Management* remains important for the day-to-day success of any organization and focuses on such issues as planning/budgeting, organizing/staffing, and controlling/problem solving. By contrast, *leadership* begins with setting direction and aligning people, as well as motivating them to success." (**McCausland**, *Developing Strategic Leaders for the 21st Century*, February 8, 2008, p. x)

Leadership, Crisis Readiness: "Frequently mentioned leadership characteristics

- Generating buy-in and commitment
- Getting adequate resources for crisis readiness
- Institutionalizing concerns of the community and other stakeholders
- Recruiting and motivating a high-caliber workforce
- Implementing sound day-to-day business management practices
- Taking a comprehensive approach to crisis readiness, and bridging gaps within the organization and between the organization's members and stakeholders.
- Visioning a "business-anew paradigm"
- Developing trust within the organization
- Conducting vulnerability assessments
- Not letting risk aversion drive all decisions
- Actively engaging in learning
- Being aware of the special role of the leader" (**Light**, *Predicting Organizational Crisis Readiness*, 2008, p. 29)

Leadership, Expectations of:

- recruit, develop, and retain high performing leaders
- generate high levels of motivation, commitment and focus on results in the workforce
- maintain high standards of honesty and integrity (**The OPM Human Capital Scorecard**, Memorandum for Heads of Executive Departments from Kay Cole James, Director, December 7, 2001; cited in **NAPA**, *The 21st Century Federal* July 2002, p. 20)

Leadership Development Program: The National Academy of Public Administration 21st Century Workforce Series identified "the following as key dimensions of a successful leadership development program…

- Program leadership and governance roles are established. Specifically,
  - The program's mission, vision, and guiding principles are communicated;
  - The program's offerings are competency based;
  - The program covers the continuum of leadership positions; and
  - The program includes developmental experiences in other program areas and agencies.
- Leadership development is linked to succession planning.
- A Learning Management System (LMS) is used o communicate, deliver, and manage training opportunities based on automated and web based tools." (**NAPA**, *Addressing the 2009 Presidential Transition at the…DHS*, May 2008 Agency Review Draft, p. 60)

Leadership Development Program: "The model [NAPA Leadership Development Model] sets forth the key criteria for successful programs—primarily, the support and active involvement of the top leader and a performance management system that supports the early identification of talent with critical skills and evaluates their ability to assume greater responsibility with further development. The model also emphasizes attention to other human capital challenges, such as diversity and retention. Leading organizations recognize that diversity can be an organizational strength and have created programs to identify and develop senior managers from among ethnic minorities, individuals with disabilities and females who have the potential to reach senior executive positions at an accelerated rate. Leading organizations also use succession planning and management to provide an incentive for high-potential employees to stay with the organization, thereby preserving future leadership capacity." (**NAPA**, *Developing the Leadership Team: An Agency Guide*, December 2003, p. 6)

Leadership in Emergency Management: "Successful emergency management requires an effective leadership to establish an organizational mission and adopt new organizational changes and cultures. In implementing strategic plans, organizations need to obtain a strong leadership commitment and support to guide in new directions, and to inspire people to achieve the organizational mission… Leaders play a pivotal role in the implementation of emergency management. Leaders must possess the ability to help mobilize the organization to develop a vision to assist in achieving the organizational goals, and to make a commitment to institutionalize the organizational changes… The emphasis is on achieving a profound level of organizational change which raises the level of consciousness about the importance and value of certain outcomes, causing employees to transcend self-interest for organizational interest and even changing their needs and desires. As Bass (1985) points out, an effective leader should work within the current organizational culture, while at the same time also changing the organizational culture." (**Choi**, "Emergency Management: Implications from a Strategic Management Perspective," *Journal of Homeland Security and Emergency Management*, Vol. 5, Issue 1, Article 1, 2008, p. 10)

Leadership in Emergency Management: "[The]…leader must be prepared to achieve the following:
Establish a vision. The emergency services leader must have a proven record of developing and implementing a broad vision for preparedness. The leader must demonstrate the capacity, knowledge and confidence to garner public and professional trust.

Create an effective strategy. The leader must possess acute analytic, critical thinking and decisionmaking skills. The ability to plan strategically and make good judgments – in advance of emergency events and under extreme pressure – is essential. And the leader must continually measure progress and refine the preparedness strategy to achieve outcomes.

Build commitment. This leader must demonstrate the ability to collaborate, form coalitions and resolve conflicts among various levels of government, disparate emergency management professionals, the private sector and the public to forge a commitment to success.

Leverage multiple tools. The…emergency services leader must be skilled at using every available tool to ensure…preparedness. The leader must be prepared to develop market, fiscal,

policy, regulatory and other tools to prepare and protect…" (**Little Hoover Commission**, *Safeguarding the Golden State*…, 2006, 41)

Leadership versus Coordination: In the 2006 Little Hoover Commission report to the California State Government on preparing for catastrophic events it notes as a section heading that "EOS [Office of Emergency Services] is Charged with Leadership, but Defines its Mission as Coordination." (13). The report states that "great authority is housed" in the CA OES and that the State had "vested it with powers beyond other state agencies – during emergencies and in advance….Yet despite these vast powers, the State is not prepared for the risks it faces….OES largely defines its role as coordinating resources in support of state and local agencies" (14-15). (**Little Hoover Commission**, *Preparing for Catastrophic Events*, 2007)

Learning: "A change in behavior that can be measured. Learning occurs as a result of knowledge transfer and includes gaining knowledge, skills, or developing new behaviors through study, instruction, and experience." (**DHS**, *DHS Training Glossary*, 2006, p. 33)

LEMOS: Local Emergency Operating System computer program.

LEO: Law Enforcement Organization(s). (**DHS**, *The ODP Guidelines*…, 2003, p. 12)

LEP: Limited English Proficiency. (**CDC**, *Reaching At Risk Populations*, 2007, p. 21)

LEPC: Local Emergency Planning Committee.

LEPC Emergency Response Plans: "The Governor of each State has designated a State Emergency Response Commission (SERC) to implement EPCRA statewide. The SERCs, in turn, have appointed about 3,500 local emergency planning districts and appointed an LEPC for each district. The SERC supervises and coordinates the activities of the LEPC and reviews the local emergency response plans. LEPC developed emergency response plans are local emergency operations plans. Incorporation of NIMS into ALL Emergency Operations Plans (EOPs) within the State is a specific requirement for States to be NIMS compliant. Therefore, LEPC emergency response plans must be NIMS compliant." (**FEMA**, *Fact Sheet: NIMS Compliance Requirements for LEPCs*, March 1, 2007)

LERT: Logistics Emergency Response Team. (**USACE**, *Response Planning Guide*, 1995, A-3)

Lessons Learned: "Lessons learned are knowledge and experience (both positive and negative) derived from observations and historical study of actual operations, training, and exercises. Exercise AAR/IPs should identify lessons learned and highlight *best practices*, and should be submitted to DHS for inclusion in the lessons learned / best practices Web portal, http://www.llis.gov/, which serves as a national network for generating, validating, and disseminating lessons learned and best practices." (**FEMA**, *HSEEP Glossary*, 2008)

Lessons Learned: "Knowledge gained through operational experience (actual events or exercises) that improve performance of others in the same discipline." (**FEMA**, *NIMS Compliance Metrics Terms of Reference* (For Fiscal Year 2007), October 23, 2006, p. 6)

Lessons Learned, Reasons Lessons not Learned: "Why is it so difficult to draw lessons from crises and to make organizational changes as a result of these lessons? The main reasons advanced are as follows:

- the time or temporal framework of the crisis analysis is too limited (Bourrier, 2002);
- the issue does not remain a priority once the immediate crisis has passed (Petak, 1985; Lagadec, 1996; Rosenthal & Kouzmin, 1996; Nathan, 2000);
- after having experienced a crisis, the area is too sensitive for any discussions (Lagadec, 1996; Bourrier, 2002);
- the pressure of managing day-to-day affairs resurfaces and tends to eclipse the period which could be devoted to post-crisis reflection (Rosenthal & al., 1989; and Rosenthal & Kouzmin, 1996);
- the manager is avoiding his or her responsibilities (Lagadec, 1991, 1996);
- managers tend to pass this off to the experts (Rosenthal & Kouzmin, 1996; Bourrier, 2002) and to use them for political ends (Hart & al., 2001);
- administrators and interveners do not envisage the transferability of experiences during a crisis to routine practices (Roux-Dufort, 2000; Bourrier, 2002). These experiences are seen as eminently contingent with their own idiosyncrasies;
- there is a lack of sharing of experiences in crisis management across organizations (Bourrier, 2002), between sectors of activities and amongst countries (Hart & al., 2001)." (**Lalonde**, "Crisis Management and Organizational Development…", 2007, p. 509)

Lessons Learned Information Sharing System (LLIS): "LLIS.gov is a national on-line network of lessons learned and best practices designed to help emergency response providers and homeland security officials prevent, prepare for, respond to, and recover from all hazards, including terrorism. LLIS.gov will enhance national preparedness by allowing response professionals to tap into a wealth of validated front-line expertise on effective planning, training, equipping, and operational practices for homeland security." (**LLIS**, *Lessons Learned Information Sharing System*)

LETPP: Law Enforcement Terrorism Prevention Program.

Letter of Determination Review (LODR): "A Letter of Determination Review (LODR) is FEMA's comment on the determination made by the lender or third party that the borrower's structure is in the Special Flood Hazard Area (SFHA). Borrowers who have good reason to dispute the flood hazard determination presented by a lender may request, jointly with the lender, that FEMA review that determination. Because of the fee required to process the request, borrowers should not consider this alternative unless they have already had the subject STRUCTURE plotted on the current effective Flood Insurance Rate Map (FIRM) and are certain it is wholly outside the SFHA. It is important to keep in mind that if any portion of a structure falls within the SFHA, the flood insurance purchase requirement will apply." (**FEMA**, *Frequently Asked Questions: General Information-What is a LODR*, 2006)

Letter of Map Amendment (LOMA): An administrative procedure to change the designation of properties identified in a Flood Insurance Rate Map (FIRM)…. Through these processes, an individual who owns, rents, or leases property may submit certain mapping and survey

information to FEMA and request that FEMA issue a document that officially removes a property and/or structure from the SFHA. In most cases, the applicant will need to hire a Licensed Land Surveyor or Registered Professional Engineer to prepare an Elevation Certificate for the property." (**FEMA**, *Letter of Map Amendment*…, 2007)

Letter of Map Change (LOMC): "A LOMC is a letter which reflects an official revision to an effective NFIP map. LOMCs are issued in place of the physical revision and republication of the effective map." (**FEMA**, *Letters of Map Change*, May 23, 2006 update)

Letter of Map Revision (LOMR): "…an official amendment, by letter, to the currently effective Flood Insurance Rate Map; issued by the Federal Emergency Management Agency and changes flood zones, delineations, and elevations." (**ASFPM**, *National Flood Programs and Polices in Review—*2007, p. 90)

Letter of Map Revision based on Fill (LOMR-F): "…an official revision, by letter, to an effective National Flood Insurance Program map. A LOMR-F provides the Federal Emergency Management Agency's determination whether a structure or parcel has been elevated on fill above the base flood elevation and excluded from the Special Flood Hazard Area. (**ASFPM**, *National Flood Programs and Polices in Review—2007*, p. 90)

Levee: "Levees and other flood damage reduction structures only reduce the dangers of flooding; they do not eliminate them. Indeed, the most extreme and dangerous events are those that are not eliminated. As the state and nation have learned in the last two decades, levees can fail and when they fail, the failure brings catastrophic consequences to those who depend upon them for flood protection." (**Galloway**, *A California Challenge*, 2007, iv)

Levee (synonym - bund, dike, embankment, stop bank): "Water-retaining earthwork used to confine streamflow within a specified area along the stream or to prevent flooding due to waves or tides. (**UNDHA**, *Disaster Management Glossary*, 1992, p. 49)

Levee, Smart: "Dealing with future floods will also require the use of the best and most innovative tools available. This includes the use of state-of-the-art technology to develop "smart" levees and flood control systems that will enable more control over water management systems during a flood and allow the possibility to act, for instance when sensors indicate the probability of a levee breach or an overtopping. These tools are available or under development right now." (**Galloway**, *A California Challenge – Flooding in the Central Valley*, October 15, 2007, p. 26)

Levees and Floodwalls: "Levees and floodwalls are constructed to exclude flood waters from the protected area, up to a certain magnitude of flood. Unlike reservoirs and channel enlargements, the flood control effectiveness of a levee or floodwall will cease abruptly if a flood should overtop it. Interior runoff impeded by the structure may cause interior flooding if there are not proper provisions for interim storage behind it or discharge past the barrier. Potential effects outside a levee, upstream and downstream, are too complex and too site dependent to generalize otherwise, but generally the constriction of flow area caused by the structure will raise flood stages upstream. Within the levee reach, flood stages may be increased or decreased depending on whether the structure forms a hydraulically long or short constriction. A levee may

reduce valley storage enough to cause the same impacts downstream as a channel. (**USACE**, *Water Resources Policies and Authorities - Digest of Water* Resources..., 1999, 13-4 and 5)

Levee Deterioration: "…levees…deteriorate due to natural and system-induced erosion, degradation and/or removal of natural berms, animal burrows, settlement, inadequate maintenance, and the build up of sediment deposits which…[reduce] the amount of water that flows through…bypass channels and river segments."[80] (**Galloway**, *A California*…, 2007, 2)

Level of Protection: "Level of Protection represents a determination by decision makers of the level of risk that they are willing to accept for the area being protected. This must be balanced against the economic and engineering feasibility of providing that level of protection." (**Galloway**, *A California Challenge*…, 16)

Lewisite: "Lewisite is a type of chemical warfare agent. This kind of agent is called a vesicant or blistering agent, because it causes blistering of the skin and mucous membranes on contact. Lewisite is an oily, colorless liquid in its pure form and can appear amber to black in its impure form. Lewisite has an odor like geraniums. Lewisite contains arsenic, a poisonous element. Lewisite is also known by its military designation, "L." Lewisite was produced in 1918 to be used in World War I, but its production was too late for it to be used in the war. Lewisite has been used only as a chemical warfare agent. It has no medical or other practical use. Lewisite is not found naturally in the environment." (**CDC**, *Facts About Lewisite*, March 14, 2003 Update)

LFA: Lead Federal Agency. (**FBI**, *USG Interagency Domestic Terrorism CONPLAN*, 2001)

Liaison: "An agency official sent to another agency to facilitate interagency communications and coordination." (**FBI**, *USG Interagency Domestic Terrorism CONPLAN*, 2001, B-3)

Liaison Officer: "The Liaison Officer is the IC/UC point of contact for representatives of other governmental agencies, non-governmental organizations (NGOs), and/or the private sector (with no jurisdiction or legal authority) to provide input on their agency's policies, resource availability, and other incident related matters." (**FEMA**, *FEMA 517*. Nov 2007, p. 2)

Liberty Down Exercise: Annual FEMA Region III interagency continuity of operations exercise. The 2007 exercise was "designed to test and evaluate the ability of organizations to activate their continuity of operations plans during a natural emergency. The exercise focused on the capability of the federal community to communicate and work effectively with various state and local agencies responsible for emergency services and safety." (**FEMA**, *Rgn. III*, *FY 07*,17)

LiDAR: Light Detection and Ranging.

Lifelines: "The public facilities and systems that provide basic life support services such as water, energy, sanitation, communications and transportation." (**UNDHA**, *DM Gloss.*, 1992, 49)

Lifeline Systems: "Public works and utilities such as electrical power, gas and liquid

[80] The Galloway 2007 report notes that "even the most perfectly engineered, impeccably maintained levee will be overtopped during a flood event that exceeds its design capacity." (At p. 10)

fuels, telecommunications, transportation, and water and sewer systems." (**APA**, 2005, p. 83)

Lightning: Luminous manifestation accompanying a sudden electrical discharge which takes place from or inside a cloud or, less often, from high structures on the ground or from mountains. (**WMO** 1992, 358)

Lightweight Epidemiology Advanced Detection and Emergency Response System The Lightweight Epidemiology Advanced Detection and Emergency Response System is an enhanced data collection, surveillance, analysis, and management system for bioterrorism incidents and has been deployed at a number of events.[81] This system includes Internet Web-based data collection, casualty tracking, ED status, and overall incident visualization tools to improve detection and management. While primarily a system for surveillance, the Lightweight Epidemiology Advanced Detection and Emergency Response System has many facets that could be easily adapted for acute disaster and MCI events." (**Chan**, "Information Technology and Emergency Medical Care During Disasters," 2004)

Likelihood: "**LIKELIHOOD** is expressed as either a frequency or a probability. Frequency is a measure of the rate at which events occur over time (e.g., events/year, incidents/year, deaths/year, etc.). Probability is a measure of the rate of a possible event expressed as a fraction of the total number of events (e.g., one-in-a-million, 1/1,000,000, or 1X10-3)." (**DOT**, *Risk Management Definitions*, Office of Hazardous Materials Safety, 2005)

LIMS: Logistics Inventory Management System. (**OIG/DHS**, *IT Mgmt. Ltr. for FY 2005*, 12)

Liquefaction: "The temporary loss of shear strength in a water-saturated, cohesionless soil deposit, or temporary transformation of unconsolidated materials into a fluid mass." (**APA**, *Planning For A Disaster-Resistant Community*, 2005, p. 83)

Liquefaction: The process that occurs when an earthquake shakes wet sandy soil until it behaves like a liquid, allowing sand to "boil up" to the surface, buildings to sink, or sloping ground to move." (**USGS**, *Putting Down Roots in Earthquake Country*, 2007, Glossary)

Liquefaction: "Loss of resistance to shear stress of a water-saturated sandy soil.

LLIS: Lessons Learned Information Sharing System.

LLRM: Local Level Risk Management (UNDP/BCPR/DRU, *LLRM*, 2006, p. 3)

LMD: Logistics Management Directorate, FEMA. (**FEMA**, *LMD Fact Sheet*, 31Jan08 mod.)

LMTI: Logistics Management Transformation Initiative. (**FEMA**, *LMA Fact Sheet*, 31Jan2008)

---

[81] Such as New York and Phoenix during 2001 World Series "when the threat of anthrax attacks had put security officials on a heightened state of alert." See p. 6 in: Cohen, John D. and John A. Hurson. *The State and Local Role in Domestic Defense* (Policy Brief). Progressive Policy Institute, January 2002, 9 pages. Accessed at: http://www.ppionline.org/documents/local_home_d.pdf

LNG: Liquefied Natural Gas. "A natural gas that has been cooled to minus 260 degrees Fahrenheit to a liquid state so that it can be transported. Consists almost entirely of methane (85-95 percent) along with small concentrations of ethane, propane, butane, and trace amounts of nitrogen. Mainly used as fuel for electricity generation, home heating, industrial manufacturing, and, to a lesser extent, motor vehicles." (**GAO**, *Maritime Security*, December 2007, p. 87)

LNO: Liaison Officer. Military. ICS. (**DHS**, *NIMS*, 2004, p. 13)

Loaned Executive Program: "The LMD [Logistics Management Directorate, FEMA] began hosting a pilot program for DHS /FEMA. The loaned executive program worked through the U.S. Chamber of Commerce and the United Parcel Service's (UPS) Foundation to bring a seasoned UPS executive into the LMD to share private sector expertise." (**FEMA**, *LMD Fact Sheet*, 31Jan2008 modification)

Local Chief Executive Responsibilities:

■ Coordinates local resources to address the full spectrum of actions to prevent, prepare for, respond to, and recover from incidents involving all hazards, including terrorism, natural disasters, accidents, and other contingencies.
■ When necessary, uses the extraordinary powers of the position (depending on state and local law) to establish a curfew, direct evacuations, and/or, in coordination with the local health authority, to order a quarantine.
■ Provides leadership and plays a key role in communicating to the public, and in helping people, businesses, and organizations cope with the consequences of any type of domestic incident within the jurisdiction.
■ Negotiates and enters into mutual aid agreements with other jurisdictions to facilitate resource sharing.
■ Requests state and, if necessary, federal assistance through the governor of the state when the jurisdiction's capabilities have been exceeded or exhausted." (**The Joint Commission**, **Standing Together**, 2005, p. 4 citing DHS, NRP, Dec, 2004))

Local Emergency Operational Capability: "The ability or level of readiness of a local government to conduct coordinated operations to minimize the effects of both peacetime and war-caused disasters or emergencies. Such operational capability consists in general of two broad categories, tangible and intangible, which can be further broken down into specific capabilities. In most functional areas, operational capability includes both essential hardware systems and trained personnel." (**DCPA**, *On-Site Assistance* (MP 63) 1974, pp. 4-5) [See "Tangible Elements…" and "Intangible Elements…]

Local Emergency Planning Committees (LEPCs): "…the Emergency Planning and Community Right-to-Know Act (EPCRA) establishes the LEPC as a forum at the local level for discussions and a focus for action in matters pertaining to hazardous materials planning. LEPCs also help to provide local governments and the public with information about possible chemical hazards in their communities. The major legal responsibilities of LEPCs are listed below. The citations are from EPCRA, Public Law 99-499. Each LEPC:

Shall review local emergency management plans once a year, or more frequently as circumstances change in the community or as any facility may require (Section 303 (a)).

Shall make available each MSDS, chemical list described in Section 311(a)(2) or Tier II report, inventory form, and follow-up emergency notice to the general public, consistent with Section 322, during normal working hours at a location designated by the LEPC (Section 324(a)).

Shall establish procedures for receiving and processing requests from the public for information under Section 324, including Tier II information under Section 312. Such procedures shall include the designation of an official to serve as coordinator for information (Section 301(c)).

Shall receive from each subject facility the name of a facility representative who will participate in the emergency planning process as a facility emergency coordinator (Section 303(d)).

Shall be informed by the community emergency coordinator of hazardous chemical releases reported by owners or operators of covered facilities (Section 304(b)(1)(a)).

Shall be given follow-up emergency information as soon as practical after a release, which requires the owner/operator to submit a notice (Section 304(c)).

Shall receive from the owner or operator of any facility a MSDS for each such chemical (upon request of the LEPC or fire department), or a list of such chemicals as described (Section 311(a)).

Shall, upon request by any person, make available an MSDS to the person in accordance with Section 324 (Section 311(a)).

Shall receive from the owner or operator of each facility an emergency and hazardous chemical inventory form (Section 312(a)).

Shall respond to a request for Tier II information no later than 45 days after the date of receipt of the request (Section 312(e)).

May commence a civil action against an owner or operator of a facility for failure to provide information under Section 303(d) or for failure to submit Tier II information under Section 312(e)(1) (Section 32 6(a)(2)(B)).” (**EPA Region VI**, *LEPC Handbook*, 2004, pp. 4-5)

Local Emergency Planning Committees (LEPCs): Local Emergency Planning Committees were established under the Emergency Planning and Community Right-to-Know Act. LEPCs are non-profit community organizations that must include in their membership, at a minimum, local officials including police, fire, civil defense, public health, transportation, and environmental professionals, as well as representatives of facilities subject to the emergency planning requirements, community groups, and the media. LEPCs must assist in the development of emergency response plans, conduct annual reviews at least annually, and provide information

about chemicals in the community to citizens. What are the required elements of a community emergency response plan that is developed by an LEPC?

• Identify facilities and transportation routes of extremely hazardous substances;
• Describe emergency response procedures, on and off site;
• Designate a community coordinator and facility coordinator(s) to implement the plan;
• Outline emergency notification procedures;
• Describe how to determine the probable affected area and population by releases;
• Describe local emergency equipment and facilities and the persons responsible for them;
• Outline evacuation plans;
• Provide a training program for emergency responders (including schedules); and,
• Provide methods and schedules for exercising emergency response plans." (**FEMA**, *Fact Sheet: NIMS Compliance Requirements for LEPCs.* March 1, 2007)

Local Emergency Planning Committees (LEPCs): "Process established by the U.S. Environmental Protection Agency for particular hazards and suggested as a method for local business and government to partner in the critical incident planning process. (**Jones**, *Critical Incident* Protocol, 2000, 37)

Local Government. "Local is defined as "(A) a county, municipality, city, town, township, local public authority, school district, special district, intrastate district, council of governments (regardless of whether the council of governments is incorporated as a nonprofit corporation under State law), regional or interstate government entity, or agency or instrumentality of a local government; (B) an Indian tribe or authorized tribal organization, or in Alaska a Native village or Alaska Regional Native Corporation; and (C) a rural community, unincorporated town or village, or other public entity." (**Homeland Security Act of 2002**)

Local Level Risk Management: "For the purpose of this global analysis, the following working definition of Local Level Risk Management will be applied:

> *A social process through which society manages to reduce the levels of disaster risk and foresee and control the emergence of new risks, through organisational and institutional structures, individual participation and motivation.*

(**UNDP BCPR DRU**, *Local Level Risk Management* (Draft Short Version), 15 March 2006, 3)

Localized Flooding: "Localized flooding refers to smaller scale flooding that can occur anywhere in a community. This can include flooding in B, C, and X Zones as depicted on the Flood Insurance Rate Map. The term is also used to refer to shallow flooding that occurs in low-lying areas after a heavy rain, flooding in small watersheds, ponding, and localized stormwater and drainage problems anywhere in the community. In this guide, "local flooding" and "localized flooding" are used interchangeably." (FEMA, *Reducing Damage from Localized Flooding – A Guide for Communities*, 2005, viii)

Locally Built and Locally Maintained Levees: "Non-Federal projects built by a local community. These projects can be incorporated into the RIP [Rehabilitation and Inspection Program] at the request of a local community and if properly maintained and operated by a local

community, may stay in the program. (**USACE**, *Fact Sheet: National Levee Safety Program*. February 1, 2007, 2)

LODR: Letter of Determination Review. (**FEMA**, *FAQs: General Info.-What is a LODR*, 2006)

Logistics: "The range of operational activities concerned with supply, handling, transportation and distribution of materials. Also applicable to the transportation of people." (**UNDHA**, *DM Glossary*, 1992, 50)

Logistics Centers (LC): "FEMA's strategically located logistics centers that support disaster operations through a variety of preparedness and response measures. These centers serve as storage sites for strategic disaster supplies and equipment, including initial supplies of certain Initial Response Resources (IRR) goods and prepackaged kits to support disaster field facilities." (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 2007, p. 54)

Logistics Emergency Response Team (LERT), USACE: "The LERT can be established at the Division or District level or can be a consolidation of Logistics personnel from several Divisions, Districts, Laboratories, or Field Operating Activities. The LERT will be made up of Logistics personnel who have volunteered and been preselected for assignment to specific positions. Each selection will be coordinated through their appropriate Commander. The team shall be capable to deploy within 24 hours of notification to a specific site and establish and manage logistics operations in support of the emergency or disaster." (**USACE**, *Response Planning Guide*, 1995, p. B-2)

Logistics Inventory Management System (LIMS III): "LIMS III provides for material management, maintenance, and logistics reporting." (**OIG/DHS**, *IT Mgmt. Ltr. for FY 2005*, 12)

Logistics Management: "Logistics Management is that part of Supply Chain Management that plans, implements, and controls the efficient, effective forward and reverse flow and storage of goods, services and related information between the point of origin and the point of consumption in order to meet customers' requirements." (**Council of Supply Chain Mgmt. Professionals**)

Logistics Management: "Logistics management is the process of planning, preparing, implementing, and evaluating all logistics functions that support an operation or activity. Effective logistics management ensures all functions are executed in a unified manner to reduce costs, ensure appropriate support actions, and decrease delivery time. Individual logistics functions and associated subfunctions include:

a. Materiel Management. Requisitioning, ordering, and sourcing (requirements processing); acquisition; asset visibility (resource tracking); receipt; storage and handling; security; accountability; inventory; deployment; issue and distribution; recovery; reuse; and disposition;

b. Property Management (Personal Property). Accountability, inventory, disposal, and record processing;

c. Facility Management. Facility selection and acquisition, building services, information systems, communications, fleet management, safety and health, and physical security; and

d. Transportation Management. Transportation prioritizing, ordering, sourcing, and acquisition; time-phasing plans; and movement coordination and tracking." (**FEMA**, *Logistics Management Support Annex*, Jan 2003, p. LM-1-2)

Logistics Management Directorate: See "FEMA Logistics Management Directorate."

Logistics Management Transformation Initiative (LMTI): "The LMD initiated a comprehensive analysis and assessment of current logistics core competencies with the intent to incorporate various elements of a third party logistics (3PL) structure, while ensuring fiscal prudence and accountability." (**FEMA**, *LMA Fact Sheet*, 31Jan2008)

Logistics Section (ICS): "The Section that provides support and resources to meet the needs of the incident." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 55)

LOMA: Letter of Map Amendment. (**FEMA**, *Letter of Map Amendment*, October 17, 2007)

LOMR-F: Letter of Map Revision Based on Fill. (**FEMA**, *Letter of Map Amendment*, 2007)

Long Term Community Recovery: "Long Term Community Recovery provides a framework for Federal Government support to State, regional, local, and tribal governments, nongovernmental organizations (NGOs), and the private sector designed to enable community recovery from the long-term consequences of incidents requiring a coordinated Federal response." (**DHS**, *Notice of Change to the NRP*, May 22, 2006, p. 31)

Long-Term Recovery Committee (LTRC): "Inevitably, some people affected by... [disaster] will not meet the eligibility criteria of government disaster aid programs or will have unmet needs even after receiving help from these programs. For them, assistance may come from a committee of churches, non-profit agencies and state and local agencies who work on problems that may range from home repair to counseling." FEMA has in the past worked with local and State organizations in federally declared disasters to set up a LTRC to work with people who have unmet needs. "One of the key elements in the committee's work is knowledge of survivors' needs. They urge emergency management personnel as well as others working with specific cases to inform the LTRC…of possible involvement…." Typically, the Long-Term Recovery Committee:

- Seeks to strengthen area-wide disaster coordination by sharing information, simplifying client access and jointly resolving cases with unmet needs;
- Helps families to develop a plan and receive adequate assistance for the recovery;
- Is composed of representatives from disaster response agencies; and
- Operates with all participating organizations as equal partners.
  (**FEMA**, *Long-Term Recovery Committee in Action*, 1999)

Loss: "Unrecoverable resources that are redirected or removed as a result of a Business Continuity event. Such losses may be loss of life, revenue, market share, competitive stature, public image, facilities, or operational capability." (**DigitalCare**, *State of Oregon Business Continuity Workshop*, 2006, p. 58)

Loss Estimation: "Forecasts of human and economic impacts and property damage from future hazard events, based on current scientific and engineering knowledge." (**FEMA**, *Developing the Mitigation Plan* (FEMA 386-3), 2003, p. a-5)

Loss Estimation Process Benefits: The loss estimation process (2nd phase of mitigation planning process), should help determine the following:

- Which areas of the community or state are affected by hazards;
- What assets will be affected and how;
- How likely it is that the hazard event may occur; and
- How intense the hazard event may be in terms of its economic and social impacts. (**FEMA**, *Developing the Mitigation Plan* (FEMA 386-3), 2003, p. 1-2)

Loss Reduction: "The technique of instituting mechanisms to lessen the exposure to a particular risk. Loss reduction involves planning for, and reacting to, an event to limit its impact. Examples of loss reduction include sprinkler systems, insurance policies, and evacuation procedures." (**DigitalCare**, *State of Oregon Business Continuity Workshop*, 2006, p. 59)

Louisiana Citizens Property Insurance Corporation: "The Louisiana Citizens Property Insurance Corporation (Louisiana Citizens) is a nonprofit, tax-exempt entity that acts as a market of last resort for residential and commercial property insurance in Louisiana." (GAO, Natural Disaster: Public Policy Options…, Nov 2007, p.63; see pp. 63-65)

Low-Signature Threats: Some "…matters…ought to be really state responsibilities, particularly in the area of prevention where we're dealing, again, with concerns about home-grown terrorism. In many cases, the challenges are what we would call "low-signature threats" -- threats that may not be detectable from spies and satellites, but require community-based policing and community-based knowledge to detect and deter and prevent threats before they come into effect. Because of that…we don't want to have the federal government become the choke point to which all this information has to pass before action takes place. That's why we're supporting fusion centers, including fusion centers with responders as well as police officials, so that states and localities can take action quickly to address issues. Now, we want to be able to have visibility into that, we want to share information up and down, but we don't want to slow up the process." (**DHS**, *Remarks by Secretary Michael Chertoff to the National Congress for Secure Communities*, December 17, 2007)

LPG: Liquefied Petroleum Gas. (**GAO**, *Maritime Security*, December 2007, pp. iv, 87)

LRC: Learning Resource Center, FEMA NETC, Emmitsburg, MD

LRC: Logistics Response Center. (**DHS**, *NRF Logistics Management Support Annex*, 2007 Draft, p. 10)

LRN: Laboratory Response Network, CDC, HHS.

LSA: Logistic(s) Staging Area. (**DHS**, *TCL*, 2007, p. 224)

LTBP: Long-Term Business Plan.

LTC: Long Term Care.

LTRC: Long-Term Recovery Committee. (**FEMA**, *Typed Resource Definitions: Incident Management Resources* (FEMA 508-2), p. 35)

Lucas v. South Carolina Coastal Commission (1992): "In *Lucas v. South Carolina Coastal Commission*, a slim majority on the high court found that since plaintiff Lucas had purchased his coastal property with the intent of residential development prior to passage of state legislation empowering the Coastal Commission to restrict such development for the purpose of natural disaster mitigation, the state owed Lucas compensation for diminution in the value of his property occasioned by this regulation. *Lucas* has since come to be seen as something of an outlier in Supreme Court takings jurisprudence, in that in subsequent decisions the high court has reverted to its more traditional stance of generally supporting government efforts at disaster mitigation land use regulation, including protection against legal attacks by landowners who purchased their property before such regulation was imposed (e.g., the *Tahoe Regional Planning Commission* decision). However, *Lucas* does serve as a reminder to policy makers and land use planners that the difference between reasonable regulation and a compensable taking still ultimately rests in the eye of the judge beholding the government action being challenged." (**Burton**, "The Constitutional Roots of All-Hazards Policy, Management, and Law," 2008, 9-10)

MA: Mission Assignment. (**FEMA**, *Mission Assignment SOPs Operating Draft*, 2007, p. 43)

MAA: Mission Area Analysis. (**HSI**, *Homeland Security Strategic Planning*, March 2007, vii)

MAA: Mutual Aid Agreement. (**FEMA**, *HSEEP Glossary*, 2008)

MAC: Mapping Analysis Center. (**FEMA**, *Mission Assignment SOPs Draft*, 2007, p. 43)

MAC: Multi-Agency Coordination. (AHRQ, Mass Medical Care…, 2007, p. 54)

MACC: Multi-Agency Command Center. (**FEMA**, *Mission Assignment SOPs Draft*, 2007, 43)

MACDIS: Military Assistance for Civil Disturbances. (**DoD**, *MACDIS*, 1194, p. 1)

MAE: Mid-America Earthquake Center, University of Illinois at Urbana-Champaign.

MAEC: Mid-America Earthquake Center, University of Illinois at Urbana-Champaign.

MAEViz: Mid-America Earthquake Center Seismic Loss Assessment System. "MAEviz is a joint effort between the Mid-America Earthquake (MAE) Center and the National Center for Supercomputing Applications (NCSA) to develop the next generation of seismic risk assessment software. MAEviz is leveraging off NCSA's cyberenvironment efforts and the University of Michigan's Sakai collaboratory to provide an advanced framework for earthquake engineering,

as well as general hazard and risk research, harnessing multi-institutional expertise, as well as existing and new tools across a broad range of technologies. The open-source framework of MAEviz employs the latest and most advanced workflow tools to provide a flexible and modular conduit through which the culmination of the interdisciplinary research and development efforts of the MAE Center are integrated and delivered to end-users. MAEviz follows the Consequence-based Risk Management methodology…using a visually-based, menu-driven system to generate damage estimates from scientific and engineering principles and data, test multiple mitigation strategies, and support modeling efforts to estimate higher level impacts of earthquake hazards, such as impacts on transportation networks, social, or economic systems. It enables policy-makers and decision-makers to ultimately develop risk reduction strategies and implement mitigation actions." (**MAE Center**, *MAEviz Software*, 2006)

Magma: "The molten matter including liquid rock and gas under pressure which may emerge from a volcanic vent." (**UNDHA**, *Disaster Management Glossary*, 1992, p. 50)

Magnitude ("Richter scale"): "Devised by C.F. Richter in 1935, an index of the seismic energy released by an earthquake (as contrasted to intensity that describes its effects at a particular place), expressed in terms of the motion that would be measured by a specific type of seismograph located 100 km from the epicentre of an earthquake. Nowadays several "magnitude scales" are in use. They are based on amplitudes of different types of seismic waves, on signal duration or on the seismic moment." (**UNDHA**, *Disaster Management Glossary*, 1992, p. 51)

Magnitude: "A number that represents the size of an earthquake source, as determined from seismographic observations. The original earthquake magnitude scale was the Richter or "local" scale (ML), defined by Charles Richter in 1935, but it has limited range and applicability. Modern magnitude scales are based on the area of fault rupture times the amount of slip (seismic moment).The moment magnitude (MW) is the preferred magnitude scale, as it provides the most reliable estimate of the size of the largest quakes. For smaller quakes, ML and MW values are nearly the same. An increase of one unit of moment magnitude (for example, from 4.6 to 5.6) corresponds approximately to a 31.6-fold increase in energy released [by definition, a two-unit increase in magnitude —for example, from 4.7 to 6.7—represents an increase in energy released of 1,000 times (31.6_31.6)]. Quakes below magnitude 2.5 are not generally felt by humans." (**USGS**, *Putting Down Roots in Earthquake Country*, 2007, Glossary)

Major Accident Reporting System (MARS): "The major accident reporting system (MARS) is used by both EU and OECD member countries to report industrial accidents in the MARS standard format and to exchange accidents information on this basis. It is a distributed information network, consisting of local databases on a MS-Windows platform in each Member State of the European Union and a central UNIX-based analysis system at the European Commission's Joint Research Centre in Ispra (MAHB) that allows complex text retrieval and pattern analysis." (**European Environment Agency**, *EEA Environmental Glossary*; citing: **Institute for the Protection and Security of the Citizen** (EC Joint Research Center). Major Accident Hazards Bureau (MAHB).)

Main shock: "The biggest of a particular sequence of earthquakes." (**UNDHA**, *DM Glossary*, 1992, 51)

Major Disaster: "`Major disaster' means natural catastrophe (including any hurricane, tornado, storm, high water, wind-driven water, tidal wave, tsunami, earthquake, volcanic eruption, landslide, mudslide, snowstorm, or drought) or, regardless of cause, any fire, flood, or explosion, in any part of the United States, which, in the determination of the President, causes damage of sufficient severity and magnitude to warrant major disaster assistance under this Act to supplement the efforts and available resources of States, local governments, and disaster relief organizations in alleviating the damage, loss, hardship, or suffering caused thereby." (**Robert T. Stafford Act** 102; 44 CFR 206.2 and 206.36)

Major Disaster Declaration: Under the Stafford Act, "A Presidential major disaster declaration puts into motion long-term Federal recovery programs, some of which are matched by State programs, and designed to help disaster victims, businesses and public entities." (**DHS**, *NRP Comment Draft*, September 2007, p. 39)

Major Disaster Declaration: "The forms of public assistance typically flow either from a major disaster declaration or an emergency declaration.32 A **major disaster** could result from any natural or manmade event that the President determines warrants supplemental Federal aid. The event must be clearly more than State or local governments can handle alone." (**DHS**, *NRF*, 2008. 41)

Major Disaster Declaration Procedures, Stafford Act (Sec. 401, 42 U.S.C. 5170): "All requests for a declaration by the President that a major disaster exists shall be made by the Governor of the affected State. Such a request shall be based on a finding that the disaster is of such severity and magnitude that effective response is beyond the capabilities of the State and the affected local governments and that Federal assistance is necessary. As part of such request, and as a prerequisite to major disaster assistance under this Act, the Governor shall take appropriate response action under State law and direct execution of the State's emergency plan. The Governor shall furnish information on the nature and amount of State and local resources which have been or will be committed to alleviating the results of the disaster, and shall certify that, for the current disaster, State and local government obligations and expenditures (of which State commitments must be a significant proportion) will comply with all applicable cost-sharing requirements of this Act. Based on the request of a Governor under this section, the President may declare under this Act that a major disaster or emergency exists." (**Stafford Act**, June 2007 (FEMA 592), p. 26)

Major Event: "Definition: a planned, non-emergency activity that draws national attention. Extended definition. a significant or designated non-emergency activity requiring additional security, such as inaugurals, State of the Union addresses, the Olympics, and international summit conferences." (**DHS**, *Lexicon: Terms and Definitions*, 2007, p. 17)

Major Event: "Refers to terrorist attacks, major disasters, and other emergencies within the United States." (**White House**, HSPD-8, December 17, 2003)

Major Events: "The term 'major events' refers to domestic terrorist attacks, major disasters, and other emergencies." (White House, HSPD-7, December 17, 2003)

Major Events, Assumptions: (**DHS**, *Target Capabilities List*, 2007, p. 2)

- May occur at any time with little or no warning
- Require significant information-sharing at the unclassified and classified levels across multiple jurisdictions and between the public and private sectors
- Involve single or multiple geographic areas
- May have significant international impact and/or require significant international information sharing, resource coordination, and/or assistance
- Can span the spectrum of incident management to include prevention, protection, response, and recovery
- Involve multiple, highly varied hazards or threats
- May result in numerous casualties; fatalities; displaced people; property loss; disruption of normal life support systems, essential public services, and basic infrastructure; and significant damage to the environment
- Impact critical infrastructure across sectors
- Overwhelm capabilities of State, local, and Tribal governments, and private-sector infrastructure owners and operators
- Attract an influx of spontaneous volunteers and supplies
- May require short-notice asset coordination and response
- May require prolonged, sustained incident management activities."[82]

Major Hazard: "Definition: a natural or human-induced phenomenon that has the potential for significant and substantial harm to human health, property, activity, and/or animals or the environment." (**DHS**, *Lexicon: Terms and Definitions*. 2007, pp. 17-18)

Major Hurricane: "A hurricane that is classified as Category 3 or higher." (**NHC**, *Glossary of NHC Terms*, 2007)

Man-Made Disaster: "Definition: a human-caused incident resulting in severe property damage, deaths, and/or multiple injuries." (**DHS**, *Lexicon: Terms and Definitions*, 2007, p. 18)

Man-Made Disasters: "A technological disaster threatens the viability of the technological system, causes massive loss of life or property, and may endanger the social environment in which it occurs. Technological disasters can have a global impact, such as the Chernobyl nuclear power plant explosion. Events of this mission type could include accidental or intentional releases of oil or other hazardous materials, power grid outage, terrorist attacks on critical infrastructure, etc." (**JCS/DoD**, *Civil Support* (Joint Publication 3-28), 2007, p. III-3)

Manage Incident: "Definition: Control access to impacted site(s) and manage and command all activities in that area." (**DHS**, *Universal Task List 2.1*, 2005, p. 66)

Manageable Span of Control (See "Span of Control")

[82] The assumptions for major events mirror those for Catastrophic events found in the National Response Plan.

Management: Management consists of decision-making activities undertaken by one or more individuals to direct and coordinate the activities of other people in order to achieve results that could not be accomplished by any one person acting alone. Effective management focuses on group effort, various forms of coordination, and the manner of making decisions. Management is required whenever two or more persons combine their efforts and resources to accomplish a goal that cannot be accomplished by acting alone. Coordination is necessary when the actions of group participants constitute parts of a total task. If one person acts alone to accomplish a task, no coordination may be required; but when that person delegates a part of the task to others, the individual efforts must be coordinated. (Unknown source)

Management and Leadership: "*Management is about coping with complexity*. It is a response to a significant development of the 20th century, namely the emergence of large, complex organizations. Good management brings order to what would otherwise be chaos. *Leadership, by contrast, is about coping with change*. *Management* remains important for the day-to-day success of any organization and focuses on such issues as planning/budgeting, organizing/staffing, and controlling/problem solving. By contrast, *leadership* begins with setting direction and aligning people, as well as motivating them to success." (**McCausland**, *Developing Strategic Leaders for the 21st Century*, February 8, 2008, p. x)

Management by Objective: "A management approach that involves a five-step [four?] process for achieving the incident goal. The Management by Objectives approach includes the following: establishing overarching incidents objectives;

> developing strategies based on overarching incidents objectives;
>
> developing and issuing assignments, plans, procedures, and protocols;
>
> establishing specific, measurable tactics or tasks for various incident management, functional activities, and directing efforts to attain them, in support of defined strategies; and
>
> documenting results to measure performance and facilitate corrective action. (**FEMA**, *NIMS Draft*, 2007, 154)

Management By Objectives: "In ICS, this is a top-down management activity which involves the following steps to achieve the incident goal:

> (1) establishing incident objectives,
>
> (2) selection of appropriate strategy(s) to achieve the objectives, and
>
> (3) the tactical direction associated with the selected strategy." (**USCG**, *IM Handbook*, 2006, Glossary 25-14)

Management Support Team (MST): "An MST is a command and control team that provides support and liaison functions for other…teams in the field." (**FEMA**, *Typed Resource Definitions*, 2005)

Manager: "Personnel within the ICS organizational units that are assigned specific managerial responsibilities, e.g. Staging Manager and Camp Manager." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 55)

Managers: "Managers should translate goals into results, which requires effective leadership by top executives and incentives that reward manager performance." (NAPA, *The 21st Century Federal Manager*, July 2002, p. 15)

Mandated Recovery Time: "The legally or organizationally specified time objective that identifies the allowable time from interruption until system/function recovery." (**DHS**, *FCD 2*, Nov. 2007, p. C-1)

Mandatory or Directed Evacuation: "This is a warning to persons within the designated area that an imminent threat to life and property exists and individuals MUST evacuate in accordance with the instructions of local officials." (**FEMA**, *Guide For All-Hazard Emergency Operations Planning* (State and Local Guide (SLG) 101), September 1996, GLO-6)

MAP: Mission Action Plan.

Map Modernization: "Map Modernization is responding to National Flood Insurance Program (NFIP) requirements and feedback provided by Federal, State, and local Program stakeholders. Flood hazard conditions are dynamic, and many NFIP maps may not reflect recent development and/or natural changes in the environment. Updated NFIP maps can take advantage of revised data and improved technologies for identifying flood hazards. Up-to-date maps support a flood insurance program that is more closely aligned with actual risk, encourage wise community-based floodplain management, and improve citizens' flood hazard awareness. Local communities and various stakeholders desired more timely updates of flood maps and easier access to the flood hazard data used to create the maps. Map Modernization is a cornerstone for helping community officials and citizens be better prepared for flood-related disasters." (**FEMA**, *Map Modernization, Why Modernize?* June 6, 2007 update)

Maritime Domain Awareness (MDA): "…knowledge of the area, of conditions and of our capabilities. The more we work to achieve MDA, the more terrorists we stop in their tracks--and the more we deter from attempting to penetrate our ports. The concept of MDA can be applied to the entire country--we must be aware of both the terrorists' capabilities and our own--on land, sea, and air." (**DHS**, *Statement…[DHS Sec] Ridge at Port of Portland*, 4May2004)

Maritime Infrastructure Recovery Plan (MIRP): "The Maritime Infrastructure Recovery Plan (MIRP)—a supporting plan for the National Strategy for Maritime Security—contains procedures for managing the economic consequences and recovery of maritime infrastructure after a transportation security incident, such as a terrorist attack. The MIRP provides strategic-level guidance for national, regional, and local decisionmakers to set priorities for restoring the

flow of domestic cargo. The plan recommends that the Captain of the Port consider key shipping channels and waterways for homeland security; military traffic; and commercial operations; key landside transportation infrastructure, such as tunnels and bridges; and other infrastructure key to maintaining continuity of operations in the port." (**GAO**, *Maritime Security*, Dec 2007, p. 57)

Maritime Operational Threat Response Plan (MOTR): "Aids coordination of U.S. government response to threats against the United States and its interests in the maritime domain by establishing roles and responsibilities for government response.**" (GAO,** *Maritime Security*, Dec 2007, p. 56)

Maritime Security Condition System (**MARSEC):** "MARSEC is a three-tiered system developed by the Coast Guard to communicate the prevailing threat environment to the marine elements of the national transportation system, including ports, facilities, and critical assets and infrastructure. The levels align closely with DHS's color-coded Homeland Security Alert System in the following way: MARSEC 1 applies when threat conditions Green, Blue, or Yellow are set; MARSEC 2 applies when threat condition Orange is set; and MARSEC 3 applies when threat condition Red is set." (**GAO**, *Maritime Security: Federal Efforts Needed.…*, Dec. 2007, 24)

Maritime Security Risk Assessment Model: "...a tool developed by the Coast Guard to determine relative risks at ports that can be compared both within the port and among ports." (**GAO**, *Maritime Security: Federal Efforts Needed to Address Challenges*…, Dec 2007, 49)

MARS: Major Accident Reporting System. (European Union).

MARS: Military Affiliate Radio System. (**OCDM**, *Annual Report 1961*, p. 88)

MARSEC: Maritime Security Condition System. (**GAO**, *Maritime Security*, Dec. 2007, iv)

Martial Law: "Martial law is not explicitly mentioned in the Constitution, but the suspension of habeas corpus is mentioned in Article 1, Section 9, and the activation of the militia in time of rebellion or invasion is mentioned in Article 1, Section 8…. In strict dictionary terms, martial law is the suspension of civil authority and the imposition of military authority. When we say a region or country is "under martial law," we mean to say that the military is in control of the area, that it acts as the police, as the courts, as the legislature. The degree of control might vary - a nation may have a civilian legislature but have the courts administered by the military. Or the legislature and courts may operate under civilian control with a military ruler. In each case, martial law is in effect, even if it is not called 'martial law.'…. Article 1, Section 9 states, 'The privilege of the Writ of Habeas Corpus shall not be suspended, unless when in Cases of Rebellion or Invasion the public Safety may require it.' Habeas corpus is a concept of law, in which a person may not be held by the government without a valid reason for being held. A writ of habeas corpus can be issued by a court upon a government agency (such as a police force or the military). Such a writ compels the agency to produce the individual to the court, and to convince the court that the person is being reasonably held. The suspension of habeas corpus allows an agency to hold a person without a charge. Suspension of habeas corpus is often equated with martial law. Because of this connection of the two concepts, it is often argued that only Congress can declare martial law, because Congress alone is granted the power to suspend

the writ. The President, however, is commander-in-chief of the military, and it has been argued that the President can take it upon himself to declare martial law. In these times, Congress may decide not to act, effectively accepting martial law by failing to stop it; Congress may agree to the declaration, putting the official stamp of approval on the declaration; or it can reject the President's imposition of martial law, which could set up a power struggle between the Congress and the Executive that only the Judiciary would be able to resolve.…..[83]

What the Supreme Court had to decide [Supreme Court case, Civil War] was "Had [the military commission] the legal power and authority to try and punish…?" Resoundingly, the Court said no. The Court stated what is almost painfully obvious: "Martial law ... destroys every guarantee of the Constitution." The Court reminded the reader that such actions were taken by the King of Great Britain, which caused, in part, the Revolution. "Civil liberty and this kind of martial law cannot endure together; the antagonism is irreconcilable; and, in the conflict, one or the other must perish." Did this mean that martial law could never be implemented? No, the Court said. The President can declare martial law when circumstances warrant it: When the civil authority cannot operate, then martial law is not only constitutional, but would be necessary: 'If, in foreign invasion or civil war, the courts are actually closed, and it is impossible to administer criminal justice according to law, then, on the theatre of active military operations, where war really prevails, there is a necessity to furnish a substitute for the civil authority, thus overthrown, to preserve the safety of the army and society; and as no power is left but the military, it is allowed to govern by martial rule until the laws can have their free course. As necessity creates the rule, so it limits its duration; for, if this government is continued after the courts are reinstated, it is a gross usurpation of power. Martial rule can never exist where the courts are open, and in the proper and unobstructed exercise of their jurisdiction. It is also confined to the locality of actual war.'….

"On 8/26/2005, in the wake of Hurricane Katrina, New Orleans was placed under martial law after widespread flooding rendered civil authority ineffective. The state of Louisiana does not have an actual legal construct called 'martial law,' but instead something quite like it: a state of public health emergency. The state of emergency allowed the governor to suspend laws, order evacuations, and limit the sales of items such as alcohol and firearms. The governor's order limited the state of emergency, to end on 9/25/2005, /unless terminated sooner.'

"There have been many instances of the use of the military within the borders of the United States, such as during the Whiskey Rebellion and in the South during the civil rights crises, but these acts are not tantamount to a declaration of martial law. The distinction must be made as clear as that between martial law and military justice: deployment of troops does not necessarily mean that the civil courts cannot function, and that is one of the keys, as the Supreme Court noted, to martial law." (**Mount**, "Constitutional Topic: Martial Law," March 15, 2006)

MASF: Mobile AeroMedical Staging Facility, USAF (**Largoza**, *Joint Medical Evac.*, 2000)

[83] As Gessert observes "The 'proclamation of limited martial law by President Eisenhower during the Operation Alert exercise of 1955…prompted broad reexamination of…emergency requirements and functions of government." (*Federal Civil Defense Organization*, 1965, p. 29)

Mass Care (ESF 6): Mass Care: Includes sheltering, feeding operations, emergency first aid, bulk distribution of emergency items, and collecting and providing information on victims to family members. (**DHS**, *Overview: ESF and Support Annexes Coordinating Federal Assistance In Support of the National Framework* (Draft), Sep.10, 2007, p. 21)

Mass Casualty: "Any large number of casualties produced in a relatively short period of time, usually as the result of a single incident such as a military aircraft accident, hurricane, flood, earthquake, or armed attack that exceeds local logistic support capabilities." (**DoD**, *DOD Dictionary of Military and Related Terms*, 2007)

Mass Casualty Event: "…a catastrophic public health- or terrorism-related event, such as influenza pandemic or the detonation of improvised nuclear devices, the resulting tens of thousands of victims will be likely to overwhelm the resources of a community's health care system." (**AHRQ**, *Mass Medical Care with Scarce Resources*, February 2007, p. viii)

Mass Casualty Event Planning Themes and Recommendations:

- Be Proactive -- Good planning must be undertaken ahead of time.
- Build and Maintain Relationships -- forge partnerships.
- Establish Regional and Local Multiagency Coordination.
- Devise, Model, and Exercise MCE Response Plans.
- Establish Clear Channels of Communication.
- Establish Clear Messages and Communications Strategies.
- Emphasize Prevention.
- Clarify the Process for Leadership and Coordination.
- Identify Existing National and State Tools, Protocols, and Processes for Each MCE Phase.
- Consider the Legal and Ethical Issues Related to Planning and Responding to an MCE.
- Integrate Palliative Care Strategies Across the Planning Process.
- Consider the Financial Implications of Responding to an MCE.
- Consider Vulnerable Populations.
- Develop Robust Security Plans. (**AHRQ**, *Mass Medical Care*…, pp. xi-xiii)

Mass Casualty Incident: "An incident which generates more patients at one time than locally available resources can manage using routine procedures. It requires exceptional emergency arrangements and additional or extraordinary assistance." (**World Health Organization**, *Mass Casualty Management Systems*, 2007, p. 30)

Mass Emergency: "An unexpected or undesirable event which requires the resources from most of all municipal departments and limited assistance from outside agencies may be needed." (**Drabek** 1996, Session 2, p. 3)

Mass Evacuation Incident Annex, National Response Framework, Scope:

- Establishes the criteria under which Federal support to mass evacuations is provided.
- Provides a concept of operations for Federal-level mass evacuation support.

- Identifies the agencies and organizations involved in a federally supported mass evacuation.
- Defines the roles and responsibilities of Federal entities in planning, preparing for, and conducting mass evacuations in support of State, tribal, and local authorities.

- Identifies guidelines to improve coordination among Federal, State, tribal, and local authorities when Federal evacuation support is required. (FEMA, Mass Evacuation Incident Annex, June 2008, p. 1)

Mass Evacuation Management Unit (MEMU): "**Programs and Tools Available under ESF-6** In the event a catastrophic disaster, the **Mass Evacuation Management Unit (MEMU)** may be activated. This unit serves as the coordinating and integrating unit to support mass evacuation activities at the Federal level. MEMU works in coordination with other mass care and emergency assistance units and ESF- 6 partners to ensure that appropriate and timely life sustaining services are delivered to evacuees. MEMU interacts with other FEMA Directorates and Regional and JFO staff to ensure coordination during multi-state mass evacuation events and during incidents requiring the support of host states." (**FEMA**, *Statement of R. David Paulison…Hearing on: "Nuclear Terrorism: Providing Medical Care and Meeting Basic Needs in the Aftermath – the Federal Response,"* June 26, 2008, p. 11)

Mass Migration Planning: "A mass migration from another country could be triggered by many events, including political unrest or all hazard incidents. Since 2003 FEMA has participated as a member of the DHS Task Force – Southeast, led by the U.S. Coast Guard and charged with preparing plans for a potential mass migration into the United States." (**FEMA**, *NEMA Initiatives and Issues From the Disaster Operations Directorate*, August 20, 2007, p. 14)

Mass Panic: "The Mass Panic Warning Myth: It is extremely important to note that "mass panic" is commonly expected by civil authorities but is almost never found, even in cases such as the 1993 and 2001 World Trade Center bombings. People generally engage in rational adaptive action even when they are very frightened. When people take inappropriate actions, it usually is because they had inadequate information about the situation or were not provided instructions on what actions to take. Timely and effective public warnings can do much to diminish the risk of panic in an emergency situation." (**Partnership for Public Warning**, *Protecting America's Communities: An Introduction to Public Alert & Warning*, 2004, 29, pp. 7-8)

Mass Prophylaxis: The process by which an entire community is to receive prophylactic drugs and vaccines over a defined period of time in response to possible exposure to a biological agent. (**Agency for Healthcare Research and Quality,** Community-Based Mass Prophylaxis – A Planning Guide for Public Health Preparedness, August 2004)[84]

Mass Prophylaxis: "Mass Prophylaxis is the capability to protect the health of the population through the administration of critical interventions in response to a public health emergency in

[84] Hupert N, Cuomo J, Callahan MA, Mushlin AI, Morse SS. *Community-Based Mass Prophylaxis: A Planning Guide for Public Health Preparedness*. AHRQ Publication No. 04-0044, August 2004. Agency for Healthcare Research and Quality, Rockville, MD. http://www.ahrq.gov/research/cbmprophyl/

order to prevent the development of disease among those who are exposed or are potentially exposed to public health threats. This capability includes the provision of appropriate follow-up and monitoring of adverse events, as well as risk communication messages to address the concerns of the public." (**DHS**, TCL, 2007, p. 479)

Mass Sheltering and Housing Assistance Recovery Strategy: "The…Federal Emergency Management Agency's (FEMA) `Mass Sheltering and Housing Assistance' recovery strategy outlines guidance and protocols for providing sheltering and housing assistance in support of a mass evacuation in connection with a Presidentially declared emergency or disaster. While this strategy focuses on assistance associated with large hurricane evacuations, the procedures and underlying processes also may apply to no-notice events, such as major earthquakes generating a subsequent need for mass sheltering and housing.

- *Congregate Shelters* are facilities used for sheltering large groups of people, but that normally serve other purposes (e.g., schools, stadiums, churches, or church-sponsored facilities).
- *Transitional Shelters* are facilities that provide short-term lodging and additional privacy, such as hotels or motels.
- *Temporary Housing* facilities are intended to provide living accommodations for an extended period of time, to include single- and multi-family homes, apartments and manufactured homes." (**FEMA**, *FEMA Recovery Strategy*, August 3, 2006)

Mass Sheltering and Housing Assistance Recovery Strategy: "Key elements of the strategy are advance identification of Congregate and Transitional Shelters to provide short-term lodging and Temporary Housing facilities for an extended period of time. Contained within the strategy is a Shelter Registration Protocol which will allow FEMA field personnel to proactively register evacuees at designated congregate shelter locations and organized evacuee reception sites, including those out-of-State. FEMA also has a Transitional Sheltering Protocol, which may be implemented when large numbers of evacuees are being housed in congregate shelters and will not be able to return to their homes for an extended period of time. In addition to the sheltering protocol, FEMA has an initiative to offer Evacuee Return Transportation, which can be used if FEMA, in support of the affected State, coordinates the out-of-State evacuation of State residents, and the evacuees are able to return to and occupy their homes within a short period of time, FEMA will organize a reverse, mass relocation effort. If evacuees are not able to return to their homes for an extended period of time, eligible evacuees may be reimbursed for independent transportation expenses to return to their homes." (**FEMA**, *Statement of Cannon*, December 4, 2007, pp. 6-7)

Master Business Continuity Professional (MBCP): "The Master Business Continuity Professional (MBCP) or Master level [offered by DRI International], targets an individual with a minimum of five years of experience as a business continuity/disaster recovery planner. In addition, the MBCP must attain a higher score on the CBCP Examination, and either successfully complete a case-study examination or complete a directed research project and paper. An additional prerequisite for the CBCP and MBCP certification levels is the demonstration of proficiency in a specific number of Subject Areas of the Professional Practices for Business Continuity Planners." (**ISSA**, *Certifications*, 2007)

Master Exercise Practitioner Program (MEPP): "The Master Exercise Practitioner Program (MEPP) eligibility includes local, Tribal, State, Territorial, Department of Homeland Security (DHS), and other Federal agency emergency management/emergency services personnel whose responsibilities involve emergency management exercises. This includes exercise training officers, emergency managers, emergency services personnel from fire, emergency medical, hospitals, public/environmental health, coroners, law enforcement, corrections officials, public works/utilities, community service/volunteer agencies, non-profits, and private entities who participate in emergency services/emergency management exercise design/development, conduct, evaluation, and improvement planning activities, members of exercise planning teams, evaluation teams, and/or who manage exercise programs." The three principle Courses comprising the MEPP Series are:

E132 Exercise Design and Evaluation
E133 Exercise Program Management and Control Simulation
E136 Exercise Development Course (**FEMA**, MEPP Series), March 3, 2008

Master Scenario Events List (MSEL): "A MSEL contains a chronological listing of the events that drive exercise play. The MSEL links simulation to action and reflects each incident or activity that will prompt players to implement the policy or procedure being tested. MSEL entries are called injects. An event may be injected via player action or controller simulation. Each MSEL inject contains:

- Designated scenario time
- Real-time delivery time
- Event synopsis
- Controller responsible for delivering inject, with controller/evaluator special instructions (if applicable)
- Expected action (player response expected after a MSEL inject is delivered)
- Intended player (agency or individual player for whom the MSEL inject is intended)
- Means of delivery (the system through which the inject is delivered, or the system that is being mimicked by an inject)
- Notes section (for controllers and evaluators to track actual events against those listed in the MSEL, with special instructions for individual controllers and evaluators)." (**DHS**, *HSEEP*, Vol. V, 2005, pp. 33-34)

Master Scenario Events List (MSEL): "The MSEL is a chronological timeline of expected actions and scripted events to be injected into exercise play by *controllers* to generate or prompt *player* activity. It ensures necessary events happen so that all *objectives* are met. Larger, more complex exercises may also employ a *Procedural Flow (ProFlow)*, which differs from the MSEL in that it only contains expected player actions or *events*. The MSEL links simulation to action, enhances exercise experience for players, and reflects an incident or activity meant to prompt *players* to action. Each MSEL record contains a designated *scenario* time, an *event* synopsis, the name of the *controller* responsible for delivering the inject; and, if applicable, special delivery instructions, the *task* and *objective* to be demonstrated, the expected action, the intended player, and a note-taking section." (**FEMA**, *HSEEP Glossary*, 2008)

Material Safety Data Sheet (MSDS): "A compilation of information required under the OSHA Hazard Communication Standard on the identity of hazardous chemicals, health and physical hazards, exposure limits, and precautions. Section 311 of Title Ill of SARA requires facilities to submit MSDSs under certain conditions." (**EPA**, *Technical Guidance for Hazards Analysis: Emergency Planning for Extremely Hazardous Substances*, 1987, p. A-6)

Material Threat Assessment (MTA): "Material Threat Assessment refers to an official estimate of the magnitude and severity of the threat that a specific CBRN agent poses to the U.S. population, based on scientific evidence and classified intelligence information of plausible worse case scenarios." (**HHS**, *Pandemic and All-Hazards Preparedness Act Progress* Report, November 2007, Appendix 1, Abbreviations and Glossary)

Material Threat Consultation: "The Homeland Security Secretary, in consultation with the Secretary [HHS] and the heads of other agencies as appropriate, shall on an ongoing basis—
''(i) assess current and emerging threats of chemical, biological, radiological, and nuclear agents; and
''(ii) determine which of such agents present a material threat against the United States population sufficient to affect national security." (**Congress**, *Project BioShield Act of 2004* (Public Law 108-276), July 21, 2004, p. 844).

Material Threat Determination (MTD): "DHS Responsibilities Under Project BioShield: In accordance with section 319F-2(c)(2) of the Project BioShield Act of 2004, it is the DHS' responsibility, in consultation with HHS and other agencies, to assess current and emerging threats of natural or chemical, biological, radiological, and nuclear agents, and to determine which agents present a significant material threat to the U.S. population. To fulfill this responsibility, DHS conducted detailed modeling of threats, vulnerabilities, and consequences for various plausible scenarios of a terrorist attack. As a result of this work, DHS identified 12 biological threats, plus radiological and nuclear devices, meeting the statutory requirement to merit a Material Threat Determination (MTD)….Accompanying each MTD is a Population Threat Assessment (PTA). The PTA estimates the size of the population exposed by the agents identified in the MTDs to gauge the impact on the population and national infrastructure if that particular agent was released for a given high consequence plausible scenario. (**DHS**, *Statement for the Record, Jeffrey W. Runge*, April 18, 2007)

Material Threat Determination (MTDs) and Population Threat Assessments (PTAs) Issued by the Department of Homeland Security:

Bacillus anthracis (ANTHRAX)
Botulinum toxins (BOTULISM)
Burkholderia mallei (GLANDERS)
Burkholderia pseudomallei (MELIODOSIS)
Ebola virus (HEMORRHAGIC FEVER)
Franciscella tularensis (TULAREMIA)
Junin virus (HEMORRHAGIC FEVER)
Marburg virus (HEMORRHAGIC FEVER)
Multi-drug resistant *Bacillus anthracis* (MDR ANTHRAX)
Radiological/Nuclear agents
Rickettsia prowazekii (TYPHUS)
Variola virus (SMALLPOX)
Volatile nerve agents [PTA only]
Yersinia pestis (PLAGUE)

(**HHS**, *HHS Public Health Emergency Medical Countermeasure Enterprise Implementation Plan for Chemical, Biological, Radiological and Nuclear* Threats, April 2007, p. 5)

Material Threat Determination (MTD): "Material Threat Determination refers to an official statement that a specific CBRN agent has been determined to pose a material threat to the U.S. population sufficient to affect national security." (**HHS**, *Pandemic and All-Hazards Preparedness Act Progress Report*, November 2007, Appendix 1, Abbreviations and Glossary)

Maximum Threat: "The greatest destruction that can be expected from an event." (**FEMA**, *Hazards Analysis for Emergency Management (Interim Guidance)*, September 1983, p. 5)

Maximum Tolerable Downtime (MTD): "The maximum number of hours for which it is acceptable that a function can be interrupted following a continuity event." (**DHS**, *FCD 2*, Nov. 2007, p. C-1)

MBCP: Master Business Continuity Professional.

MCI: Mass Casualty Incident. (Com. of MA, *Independent State Auditor's Report on Certain Activities of the Department of Public Health Bioterrorism Grants…*, March 24, 2008, p. ii)

MCI/MPI: Multiple Casualty Incident/Multiple Patient Incident.

MCATI: Managing Civil Actions in Treat Incidents. (**FEMA**, *Compendium of Terrorism Training*, 2003, p. 4)

MCE: Mass Casualty Event. (**AHRQ**, *Mass Medical Care with Scarce Resources*, 2007, p. 3)

MCE: Maximum Credible Event. (**FEMA**, *Hazards Analysis for EM*, 1983, p. ii, Glossary)

McWaters v. FEMA: "*McWaters v. FEMA* was a class action lawsuit brought by survivors of Hurricane Katrina against the Federal Emergency Management Agency for its handling of recovery efforts, with particular regard to its administration of the emergency housing assistance program as provided for in the Stafford Act. This case raised both constitutional and sovereign immunity issues, the treatment of which are intertwined in the court's decision….

In *McWaters*, the plaintiffs charged that FEMA had been so inept in its administration of the Stafford Act's temporary housing assistance program as to constitute an illegal denial of benefits accruing to them under the act. But while the federal trial court judge agreed that FEMA's actions hardly exemplified bureaucratic efficiency or even competence, he nonetheless ruled that FEMA was immune from suit under the Stafford Act's sovereign immunity provisions – but with one important exception. FEMA had summarily terminated housing assistance benefits (rental payments to motels in which displaced Gulf Coast residents were staying) without affording them a pre-termination due process opportunity to challenge such termination. FEMA asserted that it was under no such procedural obligation, since recipients had no property interest in the housing assistance benefit.

Au contraire, the court ruled. Though plaintiffs had no right to receive rental assistance past their eligibility deadline, they did have a congressionally created property interest in

entitlement to participation in the housing assistance program within the confines of those deadlines. As a result of this property interest, plaintiffs were also entitled to pre-termination due process to ensure that FEMA was making its termination decisions fairly and accurately. And since these due process rights are grounded in the Fifth Amendment to the U.S. Constitution, they trump the Stafford Act's assertion of sovereign immunity for all response and recovery actions FEMA undertook post-Hurricane Katrina." (**Burton**, "The Constitutional Roots of All-Hazards Policy, Management, and Law," 2008, pp. 10-11)

MDA: Maritime Domain Awareness. (**DHS**, *Statement…[DHS Sec] Ridge at Port of Portland*, 4May2004; **US Navy, Marine Corps, USCG**, *Cooperative Strategy for 21st Century Seapower*, Oct. 2007, p. 16)

MDMP: Military Decision-Making Process. (**DA**, *WMD-CST Operations*, Dec. 2007. 1-4)

MDR-TB: Multi-Drug Resistant Tuberculosis.

Mean Return Period: "The average time between occurrences of a particular hazardous event." (**UNDHA**, *DM Glossary*, 1992, 52)

Measure: "A determination of a jurisdiction's specific level of NIMS compliance, evaluated according to that jurisdiction's responses to the NIMS metrics that have been established by the NIMS Integration Center (NIC)." (**FEMA**, *NIMS Compliance Metrics Terms of Reference* (For Fiscal Year 2007), October 23, 2006, p. 6)

Measures and Metrics: Performance measures of quantitative or qualitative levels against which achievement of a task or capability outcome can be assessed. They describe how much, how well, and/or how quickly an action should be performed and are typically expressed in way that can be observed during an exercise or real event. The measures and metrics are not standards. They serve as guides for planning, training, and exercise activities. However, nationally accepted standards of performance, benchmarks, and guidelines are reflected, if applicable. (**DHS**, *Target Capabilities List*, March 2007)

ME/C: Medical Examiner/Coroner. (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, Acronym List)

Medical Countermeasure: "Medical countermeasure (used interchangeably with security countermeasure (SC))as defined in Section (3) of the Project BioShield Act of 2004, Section 319F-2 of the Public Health Service Act (PHS Act.): a drug (as that term is defined by section 201(g)(1) of the Federal Food, Drug, and Cosmetic Act [FDCA] (21 U.S.C. 321 (g)(1))), biological product (as that term is defined by section 351(i) of PHS (42 U.S.C. 262(i))), or device (as that term is defined by section 201 (h) of the Federal FDCA (21 U.S.C. 321 (h))) that the Secretary of HHS determines to be a priority (consistent with sections 302(2) and 304(a) of the Homeland Security Act of 2002) to treat, identify, or prevent harm from any biological, chemical, radiological or nuclear agent identified as a material threat under paragraph (2)(A)(ii), or to treat, identify, or prevent harm from a condition that may result in adverse health consequences or death and may be caused by administering a drug, biological product, or device against such an agent; the Secretary determines under Section 319F-2(c)(2)(B)(ii) of the PHS

Act to be a necessary countermeasure, and is a countermeasure for which the Secretary determines that sufficient and satisfactory clinical experience or research data (including data, if available, from pre-clinical and clinical trials) support a reasonable conclusion that the countermeasure will qualify for approval or licensing within eight years after the date of a determination under paragraph (5) of Section 319F-2(c) or is approved or cleared under chapter V of the FDCA or licensed under section 351 of the PHS Act; or is authorized for emergency use under section 564 of the FDCA." (**HHS**, *Pandemic and All-Hazards Preparedness Act Progress Report*, November 2007, Appendix 1, Abbreviations and Glossary)

Medical Education for National Defense (MEND): "Jointly with the Armed Services, OCDM continued to support the Medical Education for National Defense (MEND) program which introduces mass emergency medical care training into the curriculum of the Nation's medical schools. Fifteen additional selected schools jointed this program in FY 1960. On June 30, 1960, 70 of the Nation's 85 accredited medical schools were participating in the program." (**OCDM**, *Annual Report 1960*, p. 27)

Medical Examiner: "A physician who is appointed by the government to oversee and/or perform medicolegal death investigations. (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, p. 37)

Medical Radiobiology Advisory Team (MRAT), DoD: "provides advice and consultation to command and control regarding health physics, medical, and radiobiological issues during nuclear/radiological incidents." (**FEMA**, *Statement of Glenn Cannon*, November 15, 2007, 11)

Medical Reserve Corps (MRC): "The mission of the MRC is to organize medical, public health, and other volunteers in support of existing programs and resources to improve the health and safety of communities and the Nation. MRC units provide personnel to support and supplement the existing emergency and public health agencies in the community. MRC leaders are encouraged to adopt an all-hazards approach and more broad-based public health initiatives, including a focus on increasing disease prevention efforts, and enhancing emergency preparedness. Medical Reserve Corps volunteers include medical and public health professionals such as physicians, nurses, pharmacists, dentists, veterinarians, and epidemiologists." (**AHRQ/HHS**, *Mass Medical Care…,* 2007, p. 66)

Medical Surge: "Medical Surge is defined as rapid expansion of the capacity of the existing healthcare system in response to an event that results in increased need of personnel (clinical and non-clinical), support functions (laboratories and radiological), physical space (beds, alternate care facilities) and logistical support (clinical and non-clinical equipment and supplies)." (**DHS**, *TCL*, 2007, p. 449)

Medical Surge Capacity and Capability (MSCC) Management System: "The Medical Surge Capacity and Capability (MSCC) Management System describes a management methodology based on valid principles of emergency management and the Incident Management System (IMS). Medical and health disciplines may apply these principles to coordinate effectively with one another, and to integrate with other response organizations that have established IMS and emergency management systems (fire service, law enforcement, etc.). This promotes a common management system for all response entities—public and private—that

may be brought to bear in an emergency. In addition, the MSCC Management System guides the development of health and medical response that is consistent with the new National Incident Management System (NIMS). The MSCC Management System emphasizes *responsibility* rather than authority alone for assigning key response functions and advocates a management-by-objectives approach. In this way, the MSCC Management System describes a framework of coordination and integration across six tiers of response:

• ***Management of Individual Healthcare Assets (Tier 1):*** A well-defined IMS to collect and process information, to develop incident plans, and to manage decisions is essential to maximize MSCC. Robust processes must be applicable both to traditional hospital participants and to other healthcare facilities (HCFs) that may provide "hands on" patient care in an emergency. Thus, each healthcare asset must have information management processes to enable integration among HCFs (at Tier 2) and with higher management tiers.

• ***Management of a Healthcare Coalition (Tier 2):*** Coordination among local healthcare assets is critical to provide adequate and consistent care across an affected jurisdiction. The healthcare coalition provides a central integration mechanism for *information sharing* and *management coordination* among healthcare assets, and also establishes an effective and balanced approach to integrating medical assets into the jurisdiction's IMS.

• ***Jurisdiction Incident Management (Tier 3):*** A jurisdiction's IMS integrates healthcare assets with other response disciplines to provide the structure and support needed to maximize MSCC. In certain events, the jurisdictional IMS promotes a *unified incident management* approach that allows multiple response entities, including health and medicine, to assume significant management responsibility.

• ***Management of State Response (Tier 4):*** State Government participates in medical incident response across a range of capacities, depending on the specific event. The State may be the lead incident management authority, it may primarily provide support to incidents managed at the jurisdictional (Tier 3) level, or it may coordinate multijurisdictional incident response. Important concepts are delineated to accomplish all of these missions, ensuring that the full range of State health and medical resources is brought to bear to maximize MSCC.

• ***Interstate Regional Management Coordination (Tier 5):*** Effective mechanisms must be implemented to promote incident management coordination between affected States. This ensures consistency in regional response through coordinated incident planning, enhances information exchange between interstate jurisdictions, and maximizes MSCC through interstate mutual aid and other support. Tier 5 incorporates existing instruments, such as the Emergency Management Assistance Compact (EMAC), and describes established incident management and mutual aid concepts to address these critical needs.

• ***Federal Support to State and Jurisdiction Management (Tier 6):*** Effective management processes at the State (Tier 4) and jurisdiction (Tier 3) levels facilitate the request, receipt, and integration of Federal health and medical resources to maximize MSCC. The current status of

the Federal health and medical response is described, emphasizing the management aspects that are important for State and local managers to understand." (**HHS**, *Medical Surge Capacity and Capability* Handbook, August 2004, pp. vii-viii)

Medical Unit: "The unit within the Service Branch of the Logistics Section responsible for providing emergency medical services to incident personnel and for the development of the Medical Emergency Plan." (**Capital Health Region**, Edmonton Ca, *ICS Training SM*, 2007, 55)

Medicolegal Group: Component of the Intelligence/Investigations ICS Function. "The Medicolegal Group will manage and direct intelligence/investigations activities involving fatality management operations; and, decedents, and missing persons and unidentified persons investigations. Additionally, the Group will participate in Family Assistance Center operations to gather information regarding the decedents, missing persons and unidentified persons. As the configuration of the ICS organization is flexible, the IC/UC may choose to combine these functions or create teams to perform these functions." (**FEMA**, *IIFOG Version 3*, Feb 2008 Draft, p. 30)

Medicolegal: "Of, relating to, or concerning both medicine and law." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, p. 37)

Medicolegal Death Investigator: "A professional having the legal authority to investigate deaths for a medicolegal (medical examiner/coroner) jurisdiction, who performs scene investigations, collects evidence and develops decedents' medical and social histories to assist the medical examiner/coroner in determining the cause and manner of death. Medicolegal death investigators should have a combination of education and skills encompassing areas of medicine and law." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, p. 37)

Medicolegal Investigation: "The collection of data, photographs, evidence, witness interviews, external examination of the body at the scene, and other forensic information and analysis that will contribute to the determination of cause and manner of death, reconstruction of the accident or crime scene, and support the provision of survivability factors. The medicolegal investigation falls within the exclusive purview of the Medicolegal Authority operating at the scene of an incident." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, p. 38)

MEF: Mission Essential Functions. (**DHS**, *FCD 1*, November 2007, p. 2)

Mega-CAT: Mega-Catastrophe. (**FSR**, *Nation Unprepared for Mega-Catastrophe*, 2007, 5)

Mega-Catastrophe: "A mega-catastrophe is a natural or man-made event that has *significant* adverse nati*onal impacts on economic activity, property or human life."* (**FSR**, *Nation Unprepared*, 2007, 3)

"Although it is difficult to define such events with numerical precision, we know enough to make a vital distinction between relatively "routine" catastrophes – tornadoes, most floods, forest fires, and the like – which inevitably adversely affect many Americans in every part of the country throughout every year, and "Mega-CATs" like Katrina and 9/11 whose consequences

not only loom large in economic and human terms in a particular city or region of the country, but also adversely affect the national economy and even psyche: interrupting and depressing economic activity, leading to a drop in national output and possibly a major disruption of financial markets and activity." (**FSR**, *Nation Unprepared*, 2007, 3)

Megacommunity: "The megacommunity is a relatively recent phenomenon. It is made possible by the increasing complexity, interdependence, and technological sophistication of modern society. A megacommunity takes advantage of the pervasive information technologies (such as shared servers, satellite phones, and geographic information systems) that enable people and organizations to communicate easily across national and organizational boundaries, sharing information and collaborating in ways not possible just 10 or 15 years ago." (**Himberger**, **Sulek and Krill**, "When There Is No Cavalry," Autumn 2007, pp. 6-7)

"A megacommunity is more than a public–private partnership or alliance. It is a carefully designed effort in which all the key actors are invited to collaborate with the understanding that they are co managing the problem and the development of solutions." (Ibid, p. 9)

Megacommunity Disaster Preparedness: "Megacommunity - a public sphere in which public, private, and civil organizations join together to address a compelling issue of mutual importance. Specifically, we argue there are five core elements to a megacommunity:

- Tri-sector involvement: the public, private, and civil sectors must all be involved
- Overlapping vital interests: members share a compelling reason or need to address an issue of mutual importance
- Alliance: members demonstrate their commitment by establishing an organizing framework for working toward shared goals
- Network structure: cross-boundary, collective participation and problem-solving activities create the social network that underpins true collaboration
- Sustainability and adaptability: over time, the megacommunity becomes institutionalize and capable of evolving….

"…six guideposts that can help initiating groups - whether they are government agencies, private-sector corporations, or NGOs - begin a responsiveness-oriented megacommunity:

- *Identify and Empower Stakeholders*. The unpredictability of disaster events requires not just a full panorama of allies, but creative and engaging ways for them to participate from the beginning. U.S. Northern Command, for example, maintains an "NGO desk" to mobilize support from the civil sector. The desk is run by employees of the Humanitarian International Services Group, a nonprofit that specializes in identifying, mobilizing, and managing private-sector resources in response to a disaster.
- *Be an Initiator*. Florida state officials played an essential role by convening the state's disaster preparedness megacommunity. This involved engaging publicly elected officials at the state and local levels emergency management officials and professionals, first responders, public health professionals, private-sector and civil organization experts, academic leaders, and others. The key was engaging these players as full partners.
- *Embrace Interdependence*. During a crisis, effective medical assistance cannot be provided if hospitals lack electric power; if various police jurisdictions don't work together to provide safe, open roads for travel; or if vehicles are not available to deliver

water and medical supplies and to remove medical waste. Plan, train, and rehearse the methods by which these separate but interrelated organizations will function together if a crisis occurs.

- *Allow for Ambiguity*. Accept that your organization will have overlapping responsibilities with other organizations. For example, in the U.S. federal government, the Interior Department, Health and Human Services, Department of State, DHS, and U.S. Northern Command have all been assigned crucial but sometimes overlapping roles in the fight against pandemic influenza. Rather than ignoring this reality or resisting perceived encroachments on their turf, these organizations - if they want to succeed - will have to communicate, negotiate, and decide together in advance of a disaster how they will manage their common responsibilities.
- *Reward Collaboration*. Everyone knows collaboration is a must, but organizations and people often need a push in the right direction. Instead of protecting their turf by punishing cooperative behavior, agency leaders should create incentives that encourage it. And, of course, example is the best teacher: How much planning and training are you doing with stakeholders in your preparedness community?
- *Strengthen Your Social Networks.* Many officials have learned through sad experience that an emergency is not the time to start exchanging business cards. The more contacts that preparedness leaders have already developed in the community, the more effective their networks will be in facilitating preparedness. An important part of megacommunity activities is establishing the trust and rapport ahead of time that will be needed during a crisis…."

"…the megacommunity approach has at its core the notion of 'overlapping vital interests'. Not everyone will have the same opinion or interest but they may have a vital interest -- public safety as an example that can help unite their efforts." (**Krill and Sulek**, *The Megacommunity: A Group Discussion on Cross-Sector Collaboration for Preparedness*. EIIP Virtual Forum Presentation, February 27, 2008)

Megaports Initiative: "NNSA's [National Nuclear Security Administration, DOE] Megaports Initiative, which began in 2003, teams up with other countries to enhance their ability to screen cargo at major international seaports. The Initiative provides radiation detection equipment and trains their personnel to specifically check for nuclear or other radioactive materials. In return, NNSA requires that data be shared on detections and seizures of nuclear or radiological material that resulted from the use of the equipment provided. The Megaports Initiative has three main objectives:

- **Deterring** terrorists from using the world's seaports to ship illicit materials;
- **Detecting** nuclear or radioactive materials if it shipped via sea cargo; and
- **Interdicting** harmful material before it is used against the U.S. or one of our allies.

In cooperation with foreign governments, Megaports representatives determine the most effective placement of radiation equipment for each seaport. Installed sensors then screen cargo containers for special nuclear or other radioactive materials. If anything is detected, the sensors alert foreign port officials of the need to further examine the cargo so they can take appropriate action." (**NNSA/DOE**, *Megaports Initiative*, 2008)

Megaton: Million tons of TNT. (**Glasstone**, *The Effects of Nuclear Weapons*, 1977, 2)

MEIR: Medical Effects of Ionizing Radiation.

MEMS: Modular Emergency Medical System. (**AHRQ**, *Altered Standards of Care in Mass Casualty Events,* April 2005, p. B-1)

MFI: Mass or Multi-Fatality Incident. (**LA County**, *MFI Mgmt Guidance*…, 2008)

MGRS: Military Grid Reference System. (**DA**, *WMD-CST Operations*, 2007, Glossary-4)

MHFP: Multi-Hazard Functional Planning. (**CA OES**, *SEMS Guidelines*, 2006)

MHIP: Multi-Year Flood Hazard Identification Plan, FEMA, National Flood Insurance Program.

MHIRA: Multi Hazard Identification and Risk Assessment.

MIACG: Medical Interagency Coordination Group, National Disaster Medical System (NDMS)

Mid-America Earthquake Center (MAE): "The Mid-America Earthquake Center is one of three national earthquake engineering research centers established by the National Science Foundation and its partner institutions. The MAE Center, headquartered at the University of Illinois at Urbana-Champaign, consists of a consortium of nine core institutions, and is funded by NSF and each core university as well as through joint collaborative projects with industry and other affiliations. Center projects fall under four general types: (a) core research, (b) stakeholder research, (c) education and (d) outreach. Core research is separated into four thrust areas. The four thrust areas are (a) Consequence-based Risk Management Framework (b) Engineering Engines, (c) Social and Economic Sciences, and (d) Information Technology. A thrust leader for each of these four programs is responsible for the planning and execution of research and implementation projects." (**MAE**, *About the Center*, 2006)

Military Assistance for Civil Disturbances (MACDIS) Policy: "4. POLICY
4.1. National Policy
4.1.1. The President is authorized by the Constitution and laws of the United States to employ the Armed Forces of the United States to suppress insurrections, rebellions, and domestic violence under various conditions and circumstances. Planning and preparedness by the Federal Government and the Department of Defense for civil disturbances are important due to the potential severity of the consequences of such events for the Nation and the population.
4.1.2. Military resources may be employed in support of civilian law enforcement operations in the 50 States, the District of Columbia, the Commonwealth of Puerto Rico, and the U.S. territories and possessions only in the parameters of the Constitution and laws of the United States and the authority of the President and the Secretary of Defense, including delegations of that authority through this Directive or other means.
4.1.3. The primary responsibility for protecting life and property and maintaining law and order in the civilian community is vested in the State and local governments. Supplementary responsibility is vested by statute in specific Agencies of the Federal Government other than the Department of Defense. The President has additional powers and responsibilities under the Constitution of the United States to ensure that law and order are maintained.
4.1.4. Responsibility for the management of the Federal response to civil disturbances rests with the Attorney General of the United States.
4.1.5. Any employment of Military Forces in support of law enforcement operations shall maintain the primacy of civilian authority. Requests from the Attorney General to the Department of Defense shall be provided in response to an official request by State or Federal civil law enforcement or Executive authorities.
4.1.6. The employment of U.S. Military Forces to control civil disturbances shall be authorized by the President through an Executive order directing the Secretary of Defense to act in a specified civil jurisdiction under specific circumstances.

4.1.7. Planning by the DoD Components for MACDIS shall be compatible with contingency plans for national security emergencies, and with planning for MSCA under DoD Directive 3025.1 (reference (d)). For example:
4.1.7.1. Under E.O. 12656 (reference (b)), it is the policy of the Federal Government to have sufficient capabilities at all levels of government to meet essential defense and civilian needs during any national security emergency. That policy directs the Heads of the Federal Departments and Agencies to identify facilities and resources, both Government and private, essential to the national defense and national welfare, and to develop strategies, plans, and programs to provide for the security of such facilities and resources, and avoid or minimize disruptions during any national security emergency. In some circumstances, risks to such facilities and resources may coincide with or constitute civil disturbances." (**DoD**, *MACDIS* Directive No. 3025.12, February 4, 1994, pp. 3-4)

Military Assistance for Civil Disturbances: "The President is authorized by the Constitution and statutory laws to employ the Armed Forces of the United States to suppress insurrections, rebellions, and riots, and provide federal supplemental assistance to the states to maintain law and order. Responsibility for the management of federal response for civil disturbances rests with the Attorney General." (**JCS/DoD**, *Homeland Security* (JP 3-26), 2005, p. ix) "However, any DOD forces employed in MACDIS operations shall remain under military C2 at all times." (**JCS/DoD**, *Homeland Security* (JP 3-26), 2005, p IV-7)

Military Assistance to Civil Authorities (MACA): "Those DoD activities and measures covered under MSCA (natural and manmade disasters...) plus DoD assistance for civil disturbances, counter-drug, sensitive support, counterterrorism, and law enforcement." (**DoD**, *Military Assistance to Civil Authorities*, 1997, pp. 15-16)

Military Assistance to Civil Authorities (MACA) Immediate Response: " Requests for an immediate response (i.e., any form of immediate action taken by a DoD Component or military commander to save lives, prevent human suffering, or mitigate great property damage under imminently serious conditions) may be made to any Component or Command. The DoD Components that receive verbal requests from civil authorities for support in an exigent emergency may initiate informal planning and, if required, immediately respond as authorized in DoD Directive 3025.1... Civil authorities shall be informed that verbal requests for support in an emergency must be followed by a written request. As soon as practical, the DoD Component or Command rendering assistance shall report the fact of the request, the nature of the response, and any other pertinent information through the chain of command to the DoD Executive Secretary, who shall notify the Secretary of Defense, the Chairman of the Joint Chiefs of Staff, and any other appropriate officials. If the report does not include a copy of the civil authorities' written request, that request shall be forwarded to the DoD Executive Secretary as soon as it is available." (**DoD**, *MACA*, 1997, p. 4)

Military Assistance to Civil Authorities (MACA) Policy: "4. POLICY. It is DoD policy that:
4.1. The Department of Defense shall cooperate with and provide military assistance to civil authorities as directed by and consistent with applicable law, Presidential Directives, Executive orders, and this Directive.

4.2. All requests by civil authorities for DoD military assistance shall be evaluated by DoD approval authorities against the following criteria:
4.2.1. Legality (compliance with laws).
4.2.2. Lethality (potential use of lethal force by or against DoD Forces).
4.2.3. Risk (safety of DoD Forces).
4.2.4. Cost (who pays, impact on DoD budget).
4.2.5. Appropriateness (whether the requested mission is in the interest of the Department to conduct).
4.2.6. Readiness (impact on the Department of Defense's ability to perform its primary mission).
4.3. The Secretary of the Army is approval authority for emergency support in response to natural or man-made disasters, as specified by this Directive.
4.4. The Secretary of Defense retains approval authority for support to civil authorities involving: use of Commander in Chief (CINC)-assigned forces (personnel, units, and equipment) when required under paragraph 4.5., below; DoD support to civil disturbances; DoD responses to acts of terrorism; and DoD support that will result in a planned event with the potential for confrontation with specifically identified individuals and/or groups or will result in the use of lethal force. Nothing in this Directive prevents a commander from exercising his or her immediate emergency response authority as outlined in DoD Directive 3025.1...
4.5. With the exception of immediate responses under imminently serious conditions, as provided in subparagraph 4.7.1., below, any support that requires the deployment of forces or equipment assigned to a Combatant Command by Secretary of Defense Memorandum (reference (j)), must be coordinated with the Chairman of the Joint Chiefs of Staff. The Chairman shall evaluate each request to use Combatant Command forces or equipment to determine if there is a significant issue requiring Secretary of Defense approval. Orders providing assistance to civil authorities that are approved by the Secretary of Defense involving the use of Combatant Command forces or equipment shall be issued through the Chairman of the Joint Chiefs of Staff. Upon Secretary of Defense approval, the Secretary of the Army, when designated "the DoD Executive Agent," shall implement and oversee DoD support in accordance with such approved orders.
4.6. This Directive does not address non-Federalized National Guard assets in support of local and/or State civil agencies approved by the Governor. However, there exists potential for such deployments to result in confrontation, use of lethal force, or national media attention. Therefore, the Director of Military Support (DOMS) shall keep the Chairman of the Joint Chiefs of Staff and the Secretary of Defense informed of such support." (**DoD**, *MACA*, 1997, pp. 2-3)

Military Assistance to Civil Authorities (MACA) Support for Domestic Civil Disturbance:
"The employment of active duty military forces in domestic civil disturbances may be requested only by the President or Attorney General and authorized only by the President. When requested by the Attorney General and approved by the Secretary of Defense or when authorized by the President, the Secretary of Defense shall employ active Federal military forces under rules of engagement approved by General Counsel of the Department of Defense (GC, DoD) and the Attorney General. The Secretary of the Army, as Executive Agent for the Secretary of Defense, and with the advice and assistance of the Chairman of the Joint Chiefs of Staff, and the DOMS, shall direct the required DoD assistance, in accordance with DoD Directive 3025.12…, DoD Directive 5160.54…, and DoD Directive 3025.1…, unless otherwise directed by the Secretary of

Defense. The Secretary of the Army, in coordination with the Chairman of the Joint Chiefs of Staff, shall at all times maintain contingency plans, with rules of engagement approved by the Department of Justice, for use in civil disturbance situations." (**DoD**, *MACA*, 1997, pp. 5-6)

Military Assistance to Civil Authorities (MACA) Support for Domestic Counter-terrorism Operations:
"4.7.5. Support for Domestic Counter-terrorism Operations. The employment of U.S. military forces in response to acts or threats of domestic terrorism may be requested only by the President (or in accordance with Presidential Decision Directives) and must be authorized by the President. All requests for assistance in responding to acts or threats of domestic terrorism must also be approved by the Secretary of Defense.
4.7.5.1. Informal action on counter-terrorist support requests shall normally be requested by contacting the Assistant Secretary of Defense for Special Operations and Low Intensity Conflict (ASD(SO/LIC)), who shall review such requests or actions from a policy perspective. Following the policy review, the informal request will be passed to the Joint Staff for operational analysis. Any requests requiring consequence management preparation shall be coordinated between the Joint Staff and DOMS staff.
4.7.5.2. When a formal or informal request for support is made, or the ASD(SO/LIC) determines that such a request is imminent, the ASD(SO/LIC) shall establish a Crisis Coordination Group (consisting of, at a minimum, representatives from the Office of the ASD(SO/LIC), Office of the Under Secretary of Defense (Comptroller) (USD(C)), Department of the Army, Joint Staff, and the office of the GC, DoD, to coordinate and integrate all aspects of the DoD response actions. Before submission of a request to the Secretary of Defense for approval, all crisis management requests shall be coordinated by the ASD(SO/LIC) with the GC, DoD and the USD(C), and shall be submitted to the Under Secretary of Defense for Policy (USD(P)) for a policy review.
4.7.5.3. The Secretary of Defense shall manage the Department of Defense's response to any acts or threats of terrorism.
4.7.5.4. The Chairman of the Joint Chiefs of Staff shall assist the Secretary of Defense when he or she is implementing the DoD operational response to acts or threats of terrorism. The Chairman of the Joint Chiefs of Staff shall at all times maintain contingency plans for use in counter-terrorism situations.
4.7.5.5. The Secretary of the Army, as the DoD Executive Agent of the Secretary of Defense for civil emergencies, shall direct and execute DoD consequence management assistance, in accordance with DoD Directive 3025.1…and applicable Presidential Decision Directives, unless otherwise directed by the DOMS." (**DoD**, *MACA,* 1997, p. 6)

Military Improved Response Program (MIRP): "The Military Improved Response Program (MIRP) integrates core civilian and military response capabilities and involves representatives from the broad response community, such as fire, hazardous materials, law enforcement and security, base operations, disaster management, emergency medical services, public health and civilian communities surrounding partnering installations. Specifically, MIRP offers functional workshops that address critical responses to chemical/biological (CB) incidents." (**US Army RDECOM**, *Homeland Defense*, 2008)

Military Involvement in Disaster Activities, Problem Areas: "Coordination between military units and civilian organizations, and the channeling of civilian requests for military assistance are

undoubtedly two of the major problems in military-civilian relations during natural disaster. These problems, along with the problem of authority…have to be resolved, however, if effective military assistance is to be accomplished. There are a number of factors that are responsible for such problems. Among the main ones are:

(1) the failure of civilian officials to understand and appreciate military structure and operations, and similarly

(2) the less frequent failure of military authorities to comprehend and to accept the manner in which civilian organizations are structured and how they operate, and

(3) the absence in many cases of any viable civilian means for coordinating and integrating the activities of the numerous groups and organizations -- both civilian and military -- that assume emergency tasks." (**Anderson**, *Military-Civilian Relations in Disaster Operations*, 1968, p. 31)

(4) "Local community officials often find it particularly upsetting and frustrating when they find they have to move through a state hierarchy first, and then through a federal organization before they can acquire military disaster assistance." (**Anderson**, *Military-Civilian Relations*, 1968, 33)

(5) "Sometimes community officials do not know what resources are available at the local level… Thus, valuable time and effort may be lost because civilians request and receive military assistance which could have been acquired more easily from local sources. This problem is particularly prone to occur in communities with poor disaster planning." (**Anderson,** 1968, 36)

(6) "The issuance of vague requests for assistance by civilian officials may hinder a rapid response by the military." (**Anderson**, *Military-Civilian Relations*, 1968, 36)

(7) "It can be said as a general rule that in a community-wide disaster, when official executive authority is not exercised -- either as a result of abdication, physical incapacitation, or absence of the legitimate incumbent of the positions having executive authority -- considerable pressure is generated for other officials to assume authority. When this void occurs in the civilian sphere, the pressure goes over to the military "to do something."…. The absence of an effective community organization and authority structure through which military units can work and give support poses a serious problem for them." (**Anderson**, *Military-Civilian Relations*, 1968, 41-42)

Military Support of Civil Defense (MSCD): "MSCD is the emergency activity taken by DOD components when directed by the Secretary of Defense to help the civilian population overcome an enemy attack on CONUS, its territories and possessions." (**USACE**, *Planning and Operations Guidelines, Annex V: Definitions and Common* Terms, 1985, p. V-3)

Military Support to Civil Authorities (MSCA): "Those activities and measures taken by Department of Defense components to foster mutual assistance and support between the Department of Defense and any civil government agency in planning or preparedness for, or in the application of resources for response to, the consequences of civil emergencies or attacks, including national security emergencies." (**DoD**, *MSCA* (Directive 3025.1), 1993, p. 22; **DoD**, *MACDIS*,

1994, p. 19; **DoD**, *MSCA*, 1997, p. 16) The Secretary of the Army is designated as the DOD executive agent for MSCA. (**Title 32 CFR 185**)

Military Support to Civil Authorities (MSCA): "MSCA refers to support provided by Federal military forces, DOD civilians, contractor personnel, and DOD agencies and components in response to requests for assistance during domestic incidents to include terrorist threats or attacks, major disasters, and other emergencies. MSCA missions consist of DOD support to US domestic emergencies and for designated law enforcement, civil disturbances, and other activities." (**JCS/DoD**, *Homeland Security* (JP 3-26), 2005, p. ix)

Military Support to Civilian Law Enforcement Agencies: "The use of the military in law enforcement roles is a sensitive topic and restrictions apply to such use. Military forces performing in this role support the lead Federal agency and other supporting agencies and may be armed depending on the SecDef decision. Military support to civilian law enforcement agencies (LEAs) may include, but is not limited to national special security events, support for combating terrorism, support to counterdrug operations, maritime security, intelligence, surveillance, and reconnaissance capabilities, and general support (training support to LEAs/loan of equipment/personnel and expert advice)." (**JCS/DoD**, *Homeland Security*, 2005, p. ix)

MIRP: Maritime Incident Recovery Plan. (**GAO**, *Maritime Security*, December 2007, p. iv)

MIRP: Military Improved Response Program. (**US Army RDECOM**, *Homeland Defense*, 2008)

MIRV: Multiple Independent Reentry Vehicle. (**OCD**, *Abbreviations and Definitions*, 1971, p. 3)

Missing Persons: "Persons whose whereabouts are unknown to family or friends following an incident." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, p. 38)

Mission: "The principal components of strategic goals." (**HSI**, *HS Strategic Planning*, 2007, 63)

Mission Analysis: See "National Planning and Execution System Mission Analysis".

Mission Area Analysis: "The MAA hierarchy includes five levels: Goals, Missions, Objectives, Functions, and function-specific Tasks. These describe the HS [Homeland Security] operational mission space with sufficient granularity to enable the MAA to serve as an effective analysis and measurement tool." (**HSI**, *Homeland Security Strategic Planning*, March 28, 2007, p. vii)

Mission Area Analysis Levels:

- Mission
- Objective
- Function
- Task ((**HSI**, *HS Strategic Planning MAA*, March 28, 2007, p. 63)

Mission Assignment (MA): An "MA is a work order issued by FEMA to another Federal Agency directing completion of a specific task, and citing funding, other managerial controls,

and guidance during a federally declared disaster or emergency." (**FEMA**, "DHS OIG Letter RE: Post-Katrina Improvements." October 2007)

Mission Assignment (MA): "44 Code of Federal Regulations (CFR), Part 206 provides the definitions and general rules pertaining to mission assignments issued by FEMA. 44 CFR defines a mission assignment as a *"work order issued to a Federal agency by the Regional Director (RD), Associate Director, or Director, directing the completion by that Federal agency of a specified task and citing funding, other managerial controls, and guidance." NOTE: To date, the CFR has not been updated to reflect organizational or position title changes, e.g. Regional Administrator Director vs. Regional Director.*" (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 25, 2007. p. 1; see also, p. 55)

Mission Assignment (MA): "The term 'mission assignment' means a work order issued to a Federal agency by the Agency [FEMA], directing completion by that agency of a specified task and setting forth funding, other managerial controls, and guidance." (**Post-Katrina Emergency Management Reform Act of 2006**, p. 1424)

Mission Assignment (MA): "The vehicle used by DHS/EPR/FEMA to support Federal operations in a Stafford Act major disaster or emergency declaration. It orders immediate, short-term emergency response assistance when an applicable State or local government is overwhelmed by the event and lacks the capability to perform, or contract for, the necessary work." (**USCG**, *IM Handbook*, 2006, Glossary 25-15)

Mission Assignment Task Order: "Specific instruction given to a Federal agency under a mission assignment directing it to perform work of certain quantity or in a certain area under that mission assignment. Federal Emergency Management Agency." (FEMA, *100% Funding for Direct Federal Assistance and Grant Assistance, Recovery Policy 9523.9*, June 9, 2006)

Mission Assignment Types: "Due to different criteria for eligibility and reimbursement, mission assignments are classified into three types:

1. **Federal Operations Support (FOS) (Object Class 2501)** is defined as one Federal agency providing direct technical, operational, or logistical support to FEMA or another responding Federal agency. FOS is 100-percent federally funded and may be provided prior to a Presidential declaration of a major disaster or emergency.

Example: A mission assignment issued to U.S. Forest Service (USFS) to establish and operate a base camp to provide housing for Federal disaster workers.

2. **Technical Assistance (TA) (Object Class 2507)** is technical expertise provided by the Federal government to State and/or local jurisdictions when the State has the resources, but lacks the knowledge and/or skills needed to perform the work related to the disaster or emergency. TA is 100-percent federally funded but must be requested and approved by the State.

Example: A mission assignment issued to the U.S. Army Corps of Engineers to provide TA to affected counties in the writing of debris contracts.

3. **Direct Federal Assistance (DFA) (Object Class 2508)** consists of goods and services provided by the Federal government to the affected State when it lacks the resources to perform or contract for eligible emergency work such as the provision of food, water, generators, and medical assistance. DFA is subject to the cost-share provisions of the Declaration, normally a 25-percent State share, though the President may waive the cost share. Eligibility criteria for a DFA mission assignment:

    a. Must be as a result of the Declaration, not a pre-existing condition.
    b. Must be provided within the designated disaster area.
    c. Must consist of only emergency non-permanent work.
    d. Can be provided until the FEMA/State Agreement is signed except where it is under compelling circumstances and approved/authorized by the FEMA RA.
    e. Must be beyond the capability of the State and local government to perform or contract for the work.
    f. Must be completed within 60 days of the Declaration unless waived by the FEMA RA or the FAO with delegated authority.

Example: A mission assignment issued to the Department of Health and Human Services (HHS) to establish temporary medical facilities for disaster victims within the affected disaster area." (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 2007, p. 10)

Mission-Critical Application: "An application that is essential to the organization's ability to perform necessary business functions. Loss of the mission-critical application would have a negative impact on the business, as well as legal or regulatory impacts." (**DigitalCare**, *State of Oregon Business Continuity Workshop*, 2006, p. 60)

Mission Essential Function (MEF) Business Process Analysis (BPA): The identification and mapping of "the functional processes, workflows, activities, personnel expertise, systems, data, and facilities inherent to the execution of each identified MEF (e.g., define how each MEF is performed and executed, using a business-process flow map) that must be performed under all circumstances either uninterrupted, with minimal interruption, or requiring immediate execution in an emergency." (**DHS**, *FCD 1*, Nov. 2007, p. D-3) [Note: *FCD 1* does not provide a definition of or elaboration on the term "business-process flow map" other than to note on D-4 that one should "Outline each MEF in a business process mapping format (i.e., inputs, outputs, resources, systems, facilities, expertise, authorities) that impact the ability to complete the MEF products/services." As a possible aid, see "Business Process Map."]

Mission Essential Functions (MEFs): A subset of Governmental Functions – see "Primary Mission Essential Functions" which are a subset of MEFs, and "National Essential Functions" which are a subset of PMEFs.

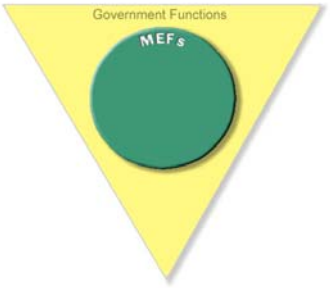

Figure 8

"MEFs are described as the limited set of agency-level government functions (as depicted in Figure 8) that must be continued throughout, or resumed rapidly after, a disruption of normal activities. MEFs are those functions that enable an organization to provide vital services, exercise civil authority, maintain the safety of the public, and sustain the industrial and economic base, during the disruption of normal operations. Once identified, MEFs serve as key continuity planning factors for agencies to determine appropriate staffing, communications, information, facilities, training, and other continuity requirements." (**DHS**, *FCD 1*, Nov. 2007, D-3)

Mission Essential Functions (MEFs): "The limited set of department- and agency-level government functions that must be continued throughout, or resumed rapidly after, a disruption of normal activities. (**HSC**, *National Continuity Policy Implementation Plan*, Aug 2007, p. 64)

Mission Essential Functions (MEFs) Initial Screening Aid:

- Is the function directed by law, directed by law, presidential directive, or executive order?
- Did a Business Process Analysis (BPA) determine that the function must be performed under all circumstances either uninterrupted, with minimal interruption, or requiring immediate execution in an emergency?

[A note to the MEF Initial Screening Aid indicates that "If the *answer to one or both of these questions is 'No,' the function is probably not a MEF."* (***DHS***, *FCD* 1, Nov. 2007, p. D-3)]

Mississippi Windstorm Underwriting Association (Mississippi Windpool): "… provides coverage against windstorms and hail for people in the six coastal counties of Mississippi who might not be able to get wind coverage in the private insurance market." (**GAO**, *Natural Disasters: Public Policy Options*…, Nov 2007, p. 21; see, also, pp. 65-67)

MIST: Mobile Incident Support Team. (**USFA**, *Responding to Incidents of National Consequence.*…, 2004, p. 26)

Mitigate: To lessen in force or intensity. This definition does not preclude "Lessening to Zero" when mitigation or to mitigate are used in relation to hazards that could cause or contribute to a peacetime civil emergency. (**FEMA**, *Definitions of Terms*, 1990)

Mitigate: "1: to cause to become less harsh or hostile; 2: to make less severe or painful." (**FEMA**, *Developing the Mitigation Plan*, 2003, i)

Mitigate: "Any action to contain, reduce, or eliminate the harmful effects of a spill or release of a hazardous substance/material." (**USCG**, *IM Handbook*, 2006, Glossary 25-15)

Mitigation: "Actions taken in response to a warning or after an incident occurs that are intended to lessen the potentially adverse effects on a given military operation or infrastructure." (**DoD**, *Defense Critical Infrastructure Protection (DCIP)*, DODD 3020.40, August 19, 2005, p. 13)

Mitigation: "Mitigation activities provide a critical foundation across the incident management spectrum from prevention through response and recovery. Examples of key mitigation activities include the following:

1. Ongoing public education and outreach activities designed to reduce loss of life and destruction of property;
2. Structural retrofitting to deter or lessen the impact of incidents and reduce loss of life, destruction of property, and impact on the environment;
3. Code enforcement through such activities as zoning regulation, land management, and building codes; and
4. Flood insurance and the buy-out of properties subjected to frequent flooding, etc." (**DHS**, *National Response Plan* (Draft #1), February 25, 2004, p. 16)

Mitigation: "Activities designed to reduce or eliminate risks to persons or property or to lessen the actual or potential effects or consequences of an incident. Mitigation measures may be implemented prior to, during, or after an incident. Mitigation measures are often developed in accordance with lessons learned from prior incidents. Mitigation involves ongoing actions to reduce exposure to, probability of, or potential loss from hazards. Measures may include zoning and building codes, floodplain buyouts, and analysis of hazard-related data to determine where it is safe to build or locate temporary facilities. Mitigation can include efforts to educate governments, businesses, and the public on measures they can take to reduce loss and injury." (**DHS,** *NIPP*, **2006**, p. 104)

Mitigation: "…mitigation is the *social* attempt to reduce the occurrence of a disaster, to reduce the vulnerability of certain populations, and to more equitably distribute the costs within the society." (**Dynes** 1993, 179)

Mitigation: Those activities designed to alleviate the effects of a major disaster or emergency or long-term activities to minimize the potentially adverse effects of future disaster in affected areas. (**FEMA**, *Definitions of Terms*, **1990**; **DHS**, *National Response Plan* (Draft #1), Feb 25, 2004, 77)

Mitigation: "Mitigation actions involve lasting, often permanent, reduction of exposure to, probability of, or potential loss from hazard events. They tend to focus on where and how to build. Examples include: zoning and building code requirements for rebuilding in high-hazard areas; floodplain buyouts; and analyses of floodplain and other hazard-related data to determine where it is safe to build in normal times, to open shelters in emergencies, or to locate temporary housing in the aftermath of a disaster. Mitigation also can involve educating businesses and the public on simple measures they can take to reduce loss and injury, like fastening bookshelves, water heaters, and file cabinets to walls to keep them from falling during earthquakes." (**FEMA**, *Guide for All Hazards Emergency Operations Planning* (SLG 101), September **1996**, p. 1-3)

Mitigation: All steps necessary to minimize the potentially adverse effects of the proposed action and to restore, preserve, and enhance natural values of wetlands; or long-term activities to minimize the potentially adverse effects of future disaster in affected areas. (**FEMA,** *Guide…SLG 101*, **1996**)

Mitigation: "Hazard mitigation is any sustained action taken to reduce or eliminate the long-term risk to human life and property from hazards. Mitigation activities may be implemented

prior to, during, or after an incident. However, it has been demonstrated that hazard mitigation is most effective when based on an inclusive, comprehensive, long-term plan that is developed before a disaster occurs." (**FEMA**, *Local Multi-Hazard Mitigation Planning Guidance*, July 1, 2008, p. 3)

Mitigation: "Mitigation means sustained action taken to reduce or eliminate long-term risk to people and property from hazards and their effects. Mitigation distinguishes actions that have a long-term impact from those that are more closely associated with preparedness for, immediate response to, and short-term recovery from a specific event" (**FEMA**, *Multi Hazard Identification and Risk Assessment*, **1997,** p. xxii)

Mitigation: "Mitigation actions protect life and property and reduce long term risks from hazards…. Mitigation is achieved primarily through community actions, although they can be greatly enhanced by the support of individuals, public-private partnerships, and Federal and State assistance." (**FEMA**, *Strategic Plan FY 1998- FY 2002*, June 1997, p. 21)

Mitigation: "Any action taken to eliminate or reduce the long-term risk to human life and property from natural hazards. Mitigation actions are accomplished by:

- **Acting on the hazard.** Seeding hurricanes or triggering avalanches may eliminate a hazard before a disaster occurs.

- **Redirecting the hazard.** A seawall or dune restoration program helps keep water away from people by redirecting the impact areas away from vulnerable locations.

- **Interacting with the hazard.** Seismic safety provisions incorporated into building codes result in structures that are more able to withstand impacts and earthquakes.

- **Avoiding the hazard.** River corridor projects create multiple beneficial uses of the floodplain while relocating structures to less vulnerable locations." (**FEMA** *IS-513*, **1999**, I-50)

Mitigation: "Taking sustained actions, such as supporting the use of strong building codes and guiding community disaster resistance, to reduce or eliminate long-term risk to people and property from hazards and their effects." (**FEMA**, *A Nation Prepared–FEMA Strategic Plan*, **2002**, p. 58)

Mitigation: "Mitigation is the effort to reduce loss of life and property by lessening the impact of disasters. Effective mitigation measures can break the cycle of disaster damage, reconstruction, and repeated damage…. Effective mitigation is achieved through three critical components – analyzing risk, reducing risk, and insuring for flood risk.

- **Analyze Risk:** Determining the impact of natural hazards that lead to effective strategies for reducing risk.

- **Reduce Risk:** Reducing or eliminating long-term risk from hazards on the existing built environment and future construction.

- **Insure for Flood Risk:** Reducing the impact of floods on the Nation by providing affordable flood insurance." (**FEMA**, *Fact Sheet, FEMA's Mitigation Directorate*, **August 2007**, p. 1)

Mitigation: "Provides a critical foundation in the effort to reduce the loss of life and property from natural and/or manmade disasters by avoiding or lessening the impact of a disaster and providing value to the public by creating safer communities. Mitigation seeks to fix the cycle of disaster damage, reconstruction, and repeated damage. These activities or actions, in most cases, will have a long-term sustained effect." (**FEMA**, *NIMS* (FEMA 501 Draft), **2007**, p. 154)

Mitigation: "Examples of mitigation activities include the following:
• ongoing public education and outreach activities designed to reduce loss of life and destruction of property;
• complying with or exceeding floodplain management and land-use regulations;
• enforcing stringent building codes, seismic design standards, and wind-bracing requirements for new construction, or repairing and/or retrofitting existing buildings;
• supporting measures to ensure the protection and resilience of critical infrastructure and key resources designed to ensure continuity of business and the economic stability of communities;
• acquiring damaged homes or businesses in flood-prone areas, relocating the structures, and returning the property to open space, wetlands, or recreational uses;
• identifying, utilizing, and refurbishing shelters and safe rooms to help protect people in their homes, public buildings, and schools in hurricane− and tornado-prone areas;
• implementing a vital records program at all levels of government to prevent loss of crucial documents and records;
• intelligence sharing and linkage leading to other law enforcement activities, such as infiltration of a terrorist cell to prevent an attack;
• periodic remapping of hazard or potential hazard zones, using geospatial techniques; and
• management of data regarding historical incidents to support strategic planning and analysis." (**FEMA**, *National Incident Management System* (FEMA 501/Draft), **August 2007**, pp. 21-22)

Mitigation: "Activities designed to reduce or eliminate risks to persons or property or to lessen the actual or potential effects or consequences of a hazard. Mitigation involves ongoing actions to reduce exposure to, probability of, or potential loss from hazards. Examples include zoning and building codes, floodplain buyouts, and analysis of hazard-related data to determine where it is safe to build or locate temporary facilities. Mitigation can include efforts to educate governments, businesses and the public on measures they can take to reduce loss and injury." (**HHS**, *Medical Surge Capacity and Capability Handbook*, August 2004, p. D-7, Glossary)

Mitigation: "Limitation of any negative consequence of a particular incident." (**ISO 22399**, *Societal Security*…, 2007, 4)

Mitigation: In its simplest sense, mitigation is risk management. It is a term that we at FEMA use to describe actions that can be taken at the individual, local, State and Federal levels to reduce the overall risk from natural disasters. It is getting a handle on the costs of disasters in our society, including not only moneys, but also suffering and economic disruptions. (**Krimm** 1998)

Mitigation and Prevention: "Mitigation planning includes a review of ways to eliminate or reduce the impact of future emergencies. Specific hazard mitigation plans are prepared following a federally-declared disaster. They reflect the current risk analysis and mitigation priorities specific to the declared disaster. An alternate and more common term for mitigation is prevention. In the field of emergency services, however, the term prevention is used to refer to stopping an event from happening. Emergency managers point out that while it is possible to prevent terrorist attacks, it is not possible to prevent earthquakes. It is, however, possible to reduce or mitigate their impact. Despite years of using the term mitigation for reducing harm, the federal government has recently adopted the term prevention to refer to mitigation activities." (**Little Hoover Commission**, *Safeguarding the Golden State*…, 2006, 6)

Mitigation: "Activities that reduce the degree of long-term risk to human life and property from natural and man-made hazards; e.g., building codes, disaster insurance, land-use management, risk mapping, safety codes, and tax incentives and disincentives." (**McLoughlin** 1985, 166)

> "Mitigation consists of planned and orderly efforts to prevent hazards that are preventable and lessen the impact of those that are not. Mitigation activities can act in three ways to prevent or reduce effects of potential hazards. First, they can act on the hazard to eliminate it or to reduce the frequency and intensity of its occurrence. Second, they can change the way a hazard interacts with people and their support systems. Third, they can alter the way people live and the systems they create." (**McLoughlin** 1985, 170)

Mitigation: "Actions taken to prevent or reduce product loss, human injury or death, environmental damage, and property damage due to the release or potential release of hazardous materials." (**NFPA 471**, 1997, p. 8)

Mitigation: "Activities taken to reduce the severity or consequences of an emergency." (**NFPA 1600**, 2007, p. 8)

Mitigation: "Mitigation includes any activities that actually eliminate or reduce the probability of occurrence of a disaster (for example, arms build-up to deter enemy attack or legislation that takes the unstable double-bottom tanker off the highways). It includes long-term activities designed to reduce the effects of unavoidable disaster (for example, land-use management, establishing comprehensive emergency management programs, or legislating building safety codes)." (**NGA**, *Comprehensive Emergency Management Governors' Guide*, 1979, p. 12)

Mitigation: Action to reduce the effects of a disaster on a population. (**Nimpuno**, 1998)

Mitigation: "…mitigation is seen as prevention – stopping a negative event before it happens." (**Peterson and Perry** 1999, 242)

Mitigation: "…sustained actions to reduce or eliminate long-term risks to people and property from hazards and their effects." (**Post-Katrina Emergency Management Reform Act of 2006**, p. 1399)

Mitigation: "Measures taken in advance of a disaster aimed at decreasing or eliminating its impact on society and on environment." (**UNDHA** *Internationally Agreed Glossary…*, 1992, p.53)

Mitigation: "Structural and non-structural measures undertaken to limit the adverse impact of natural hazards, environmental degradation and technological hazards." (**UN ISDR** 2002, 25)

Mitigation, Homeland Security: "Because we must not permit the threat of terrorism to alter the American way of life, we have to accept some level of terrorist risk as a permanent condition. We must constantly balance the benefits of mitigating this risk against both the economic costs and infringements on individual liberty that this mitigation entails. No mathematical formula can reveal the appropriate balance; it must be determined by politically accountable leaders exercising sound, considered judgment informed by top-notch scientists, medical experts, and engineers." (**White House**, *National Strategy for Homeland Security*, July 2002, p. 2)

Mitigation, Non-Structural: ***"****Non-structural mitigation* refers to elements of the building that do not belong to the load-bearing system. It reduces risk by means of such actions as land-use planning, early warning systems, insurance policies, legislation and regulatory measures such as zoning and building codes, and education and training activities such as evacuation plans, drills, and preparedness curricula." (**OAS**, *School/Shelter Hazard Vulnerability Reduction Resource Page*, 2001)

Mitigation, Structural: "*Structural mitigation* consists of measures that involve the creation/erection of physical structures. Some examples are levees, drainage systems, retaining walls, earthquake bracing systems, and hurricane straps and shutters." (**OAS**, *School/Shelter Hazard Vulnerability Reduction Resource Page*, 2001)

Mitigation Goals:
1. Save lives and reduce injury.
2. Avoid, minimize or reduce damage to property including but not limited to critical facilities, infrastructure and those properties known to receive or experience repetitive damages.
3. Reduce exposure to risk, while protecting or restoring natural processes to the maximum extent possible.
4. Consider the wise uses of land in known or identified hazard areas.
5. Encourage the development and implementation of long-term, cost-effective and environmentally sound mitigation projects.
6. Promote hazard mitigation awareness and education throughout the County.
7. Improve community emergency management capability (i.e., prepare, respond, recover, mitigate).
8. Maintain economic viability after a hazard event. (**Tetra Tech EM**, *Suffolk*, 2007, p. ES-4)

Mitigation Mortgage: A proposal of the Financial Services Roundtable wherein the financial industry would develop "lending instruments with maturities and interest rates comparable to those they now offer in financing first and second residential mortgages. Such loans would be marketed for individuals seeking loans to finance mitigation upgrades to their existing structures. For new structures, the costs of mitigation can be added to the initial mortgage (ratings of the ability of homes to withstand wind, water, or earthquake damage would help stimulate interest in obtaining such mortgages)." (**FSR**, *Mega-Catastrophe*, May 2007, 37)

Mitigation Planning Under the Stafford Act (Sec. 322, 42 U.S.C. 5165):
"(a) Requirement of Mitigation Plan - As a condition of receipt of an increased Federal share for hazard mitigation measures under subsection (e), a State, local, or tribal government shall develop and submit for approval to the President a mitigation plan that outlines processes for identifying the natural hazards, risks, and vulnerabilities of the area under the jurisdiction of the government.
(b) Local and Tribal Plans - Each mitigation plan developed by a local or tribal government shall: (1) describe actions to mitigate hazards, risks, and vulnerabilities identified under the plan; and (2) establish a strategy to implement those actions.
(c) State Plans - The State process of development of a mitigation plan under this section shall - (1) identify the natural hazards, risks, and vulnerabilities of areas in the State; (2) support development of local mitigation plans; (3) provide for technical assistance to local and tribal governments for mitigation planning; and (4) identify and prioritize mitigation actions that the State will support, as resources become available.
(d) Funding - (1) In general - Federal contributions under section 5170c of this title may be used to fund the development and updating of mitigation plans under this section. (2) Maximum federal contribution - With respect to any mitigation plan, a State, local, or tribal government may use an amount of Federal contributions under section 5170c of this title not to exceed 7 percent of the amount of such contributions available to the government as of a date determined by the government.
(e) Increased Federal Share for Hazard Mitigation Measures - (1) In general - If, at the time of the declaration of a major disaster, a State has in effect an approved mitigation plan under this section, the President may increase to 20 percent, with respect to the major disaster, the maximum percentage specified in the last sentence of section 5170c(a) of this title. (2) Factors for consideration -In determining whether to increase the maximum percentage under paragraph (1), the President shall consider whether the State has established - (A) eligibility criteria for property acquisition and other types of mitigation measures; (B) requirements for cost effectiveness that are related to the eligibility criteria; (C) a system of priorities that is related to the eligibility criteria; and (D) a process by which an assessment of the effectiveness of a mitigation action may be carried out after the mitigation action is complete. (**Stafford Act**, June 2007 (FEMA 592) pp. 22-23; **Public Law 106-390**, *DMA*, October 20, 2000)

Mitigation Plans: "Mitigation plans describe activities that can be taken prior to, during, or after an incident to reduce or eliminate risks to persons or property or to lessen the actual or potential effects or consequences of an incident." (**DHS**, *NIMS*, 2004, p. 37)

Mitigation Plans, Common Elements Within Successful Plans: "The most successful of mitigation plans – where practical, meaningful mitigation actions resulted – have two common elements:

- Comprehensive risk and capability assessments that form a solid foundation for decision making; and
- Participation by a wide range of stakeholders who plan a role in identifying and implementing mitigation actions." (**FEMA**, *Local Multi-Hazard Mitigation Planning Guidance*, July 1, 2008, p. 4)

Mitigation Strategy: "FEMA's mitigation strategy has four areas of focus:

1. *Federal Mitigation*. FEMA will lead the effort to ensure that the authorities and resources of the federal government which affect the built environment are supporting, the maximum degree practicable, community-based mitigation decisions/actions.
2. *State Mitigation.* FEMA will establish a collaborative partnership with State-level mitigation stakeholders to develop criteria and incentives for the establishment of comprehensive State mitigation initiatives which marshal the resources and authorities of State government to support community-based mitigation decisions/actions.
3. *Community Mitigation*. FEMA will establish a collaborative partnership with community-level stakeholders to develop a national initiative to reduce risk through a voluntary, community-based, incentive-driven decisions/actions.
4. *Private/Public Mitigation Partnership*. FEMA will lead an effort to identify and maximize the contributions of the private sector to the national mitigation effort – through business-driven construction and land-use decisions, as well as incentives for mitigation decisions/actions through insurance and financial market instruments." (**FEMA**, *Strategic Plan FY 1998-2002*, 1997, p. 21-22)

Mitigation Strategy: "**A.5.5.1** The mitigation strategy should include the following:
(1) Use of applicable building construction standards
(2) Hazard avoidance through appropriate land use practices
(3) Relocation, retrofitting, or removal of structures at risk
(4) Removal or elimination of the hazard
(5) Reduction or limitation of the amount or size of the hazard
(6) Segregation of the hazard from that which is to be protected
(7) Modification of the basic characteristics of the hazard
(8) Control of the rate of release of the hazard
(9) Provision of protective systems or equipment for both cyber and physical risks
(10) Establishment of hazard warning and communication procedures
(11) Redundancy or diversity of essential personnel, critical systems, equipment, information, operations, or materials
(12) Acceptance/retention/transfer of risk (insurance programs)
(13) Protection of competitive/proprietary information

A.5.5.2 The mitigation strategy should establish interim and long-term actions to reduce the risks from hazards. (**NFPA 1600**, 2007, p. 15)

Mitigation Strategy Section, Mitigation Plan:

- A summary of past and current mitigation efforts
- Local hazard mitigation goals and objectives
- Identification and analysis of mitigation measures and projects being considered
- Multi-jurisdictional mitigation strategy (goals and objectives)
- Mitigation action plan (summary of specific actions) (**Tetra Tech**, *Suffolk*, 2007, ES-4)

MLA: Maritime Liaison Agent. (**GAO**, *Maritime Security*, December 2007, pp. iv, 98-99)

MMA: Major Metropolitan Area.

MMMS: "Map Modernization Management Support (FEMA).

MMRS: Metropolitan Medical Response System.

MOA: Memorandum of Agreement. (**DA**, *WMD-CST Operations*, December 2007, Glossary-4)

Mob CNTR: Mobilization Center.

MOBDES: Mobilization Designee, DOD.

Mobile Emergency Response Support (MERS): "The primary function of MERS is to provide mobile telecommunications capabilities and life, logistics, operational and power generation support required for the on-site management of disaster response activities. MERS support falls into three broad categories: (1) operational support elements; (2) communications equipment and operators; and (3) logistics support. MERS supports Federal, State and local responders in their efforts to save lives, protect property and coordinate disaster operations. Staged in six strategic locations, one with offshore capabilities, the MERS detachments can concurrently support multiple field operating sites within a disaster area." (**DHS**, *NRF Comment Draft*, 2007, 60)

Mobile Emergency Response Support (MERS): "Another key FEMA disaster response asset…is the MERS System. The primary function of MERS is to provide mobile telecommunications, logistics, and operational capabilities for the on-site management of disaster response activities. MERS support falls into three broad areas:

- Operations - Mobile Emergency Operations Centers, quick reaction support, disaster preparedness (HAZMAT) officers, and MERS security officers.
- Communications - satellite, multiple radio vans, High Frequency line of sight microwave, land mobile radios, voice, video, and data capabilities, and wide area interoperability.
- Logistics - fuel, water, HVAC, life support, transportation, and power.

"MERS provides support required by Federal, State and local responders and can provide prompt and rapid multi-media communications, information processing, logistics, administrative, and operational support. Staged in six strategic locations, one with offshore capabilities, the MERS detachments can concurrently support a large JFO and multiple field operating sites within a disaster area. The telecommunications function is accomplished using a variety of communications transmission systems including satellite, high frequency, and microwave line-of-sight interconnected by fiber optic cables to voice and data switches, local area networks, and desktop devices such as personal computers and telephones. MERS telecommunications assets can be provided for one or multiple locations within a disaster area and can be used to establish or reestablish communications connectivity with the public telecommunications system or Government telecommunications networks. Facilities within a disaster region can be interconnected by MERS assets to enhance emergency communications interoperability and

austere facilities can be wired for computer, telephone, and video networks." (**FEMA**, *Statement of Glenn Cannon*, November 15, 2007, p. 8)

Mobile Registration Intake Centers (MRICs) Pilot: "Recognizing many disaster victims may be stranded or located in congregate shelters without communications, and unable to register for assistance, FEMA has established a new registration pilot program that pushes registration capabilities directly into the field. For the 2007 hurricane season, FEMA will have the ability to deploy Mobile Registrations Intake Centers immediately to congregate shelters and provide an on-site capability to quickly register for FEMA assistance." (**FEMA**, *Statement of Paulison*, July 31, 2007, p. 18)

Mobilization: "The process and procedures used by all organizations—Federal, State, tribal, and local—for activating, assembling, and transporting all resources that have been requested to respond to or support an incident." (**FEMA**, *NIMS* (FEMA 501/Draft), 2007, p. 154)

Mobilization (MOB) Center: "An off-incident location at which emergency service personnel and equipment are temporarily located pending assignment, release, or reassignment." (**USCG**, *IM Handbook*, 2006, Glossary 25-15)

Mobilization (MOB) Centers: "Temporary federal facilities in theater at which commodities, equipment and personnel can be received and pre-positioned for deployment as required; commodities remain under the control of HQ Logistics and can be deployed to multiple states; generally projected to hold 3 days of commodities." (**FEMA**, *Logistics Supply Chain*, 2006)

Mobilization, Historical Federal Organization for Emergency Mobilization (1947-1979):

- National Security Resources Board (NSRB, 1947-1949)
- NSRB, Executive Office of the President (EOP, 1949-1953)
- Office of Defense Mobilization, (ODM, EOP, 1950-1953)
- Defense Production Administration (DPA, 1951-1953)
- Office of Defense Mobilization (ODM, EOP, 1953-1958)
- Office of Defense and Civilian Mobilization (ODCM, EOP, 1958)
- Office of Civil and Defense Mobilization (OCDM, EOP, 1958-1961)
- Office of Emergency Planning (EOP, 1961-1968)
- Office of Emergency Preparedness (EOP, 1968-1973)
- Office of Preparedness (OP, General Services Administration, 1973-1975)
- Federal Preparedness Agency (FPA, GSA, 1975-1979)

(**National Archives**, *Guide to Federal Records*, Records of FEMA, Record Group 311, p. 1)

MOC: Medical Operations Center. (**EG&G**, *San Diego County Firestorms AAR 2007*, Feb 08, vi)

MOC: MERS Operations Center. (**FEMA**, *Statement of Glenn Cannon*, November 2007, p. 5)

Mock Disaster: "One method of exercising teams in which participants are challenged to determine the actions they would take in the event of a specific disaster scenario. Mock disasters usually involve all, or most, of the applicable teams. Under the guidance of exercise

coordinators, the teams walk through the actions they would take per their plans, or simulate performance of these actions. Teams may be at a single exercise location, or at multiple locations, with communication between teams simulating actual 'disaster mode' communications. A mock disaster will typically operate on a compressed timeframe representing many hours, or even days." (**DigitalCare**, *State of OR Business Continuity Workshop*, 2006, 60)

Model State Emergency Health Powers Act (MSEHPA): "Many State legislatures and health departments have amended State statutes and regulations to reflect modern principles of public health emergency preparedness based, in part, on the Model State Emergency Health Powers Act (MSEHPA) drafted in fall of 2001 by the Center for Law and the Public's Health at Georgetown University and The Johns Hopkins University.8 MSEHPA presents State and local governments with a template for reviewing existing emergency declaration laws and developing legislative or other regulatory reforms to facilitate an effective public health response.9 While this chapter refers to MSEHPA to explain common provisions that are featured in many States' emergency preparedness laws, MSEHPA is not law unless a State has enacted it. According to the Center, more than 35 States have enacted laws based in whole or part on MSEHPA since the Act's completion.10 These laws vary across jurisdictions and may be interpreted differently depending on a host of factors." (**AHRQ,** *Mass Medical Care*, 2007, p. 27)

Model State Emergency Health Powers Act (MSEHPA): "In the spring of 2001, officials of the Centers for Disease Control and Prevention (CDC) asked the staff of the Center for Law and the Public's Health (based at Georgetown University and the Johns Hopkins University) to draft a…[MSEHPA]. This Model Act would enable states to revise their public health statutes in order to take account of contemporary scientific knowledge, communications technology, and case law on the rights of individuals and the duties of government. Many states had not substantially revised their public codes for a half century or longer.

"Drafting the Model Act accelerated after September 11th and especially after the first anthrax case was identified on October 4th. The Georgetown/Hopkins lawyers posted a draft on the World Wide Web in late October (and revised it in December). Secretary of Health and Human Services Tommy G. Thompson enthusiastically endorsed the draft. Across the political spectrum, however, but especially among liberals and libertarians, attacks began immediately on the need for the act and its major provisions—especially on its recommendations for planning, surveillance, public information, taking property, directing the work of health professionals and immunizing them from liability, and interfering with the privacy and liberty of persons to prevent the spread of infectious disease.

"Nevertheless, legislation inspired by the Model Act has been introduced in more than 30 states.[2] In some states, legislators and governors who supported the main thrust of the act decided that archaic provisions were better than anarchy. They feared that opening the entire public health code to amendment risked the repeal of substantial sections of it. In other states, lawmakers have used the Model Act as a checklist against which to review and revise their public health statute. No state, to our knowledge, has adopted the Model Act posted on the Web.

"The Model Act has become a contentious document in a process of policymaking that is likely to continue as long as the threat of bioterrorism persists. This new fact of life is recognized in the

new Department of Health and Human Services grant program to improve public health infrastructure for better defense against terrorism, which requires states to conduct ongoing review and revision of pertinent laws and regulations." (**Colmers and Fox**, March 2003)

Modified Mercalli Intensity Scale: A measure of the effects of an earthquake in a specific location. (**Deyle, French, Olshansky, and Paterson** 1998, 124)

Modified Mercalli Intensity Scale: (**Jaffe, Buffer, and Thurow** 1981)

Intensity	Detectability/Level Impact
I	Detected only by sensitive instruments
II	Felt by a few persons at rest, especially on upper floors
III	Felt noticeably indoors, but not always recognized as a quake
IV	Felt indoors by many, outdoors by a few
V	Felt by most people, damage to glass and plaster
VI	Felt by all, many frightened and run outdoors, damage small
VII	Everybody runs outdoors, damage to buildings varies
VIII	Panel walls thrown out of frames, fall of walls and chimneys
IX	Buildings shifted off foundations, cracked, thrown out of plumb
X	Most masonry and framed structures destroyed, ground cracked
XI	New structures still standing, bridges destroyed, ground fissures
XII	Damage total, waves seen on ground surface

Modular Emergency Medical System (MEMS): "The Modular Emergency Medical System (MEMS) offers a comprehensive plan of operations and standards for responding to a mass casualty event of such size that alternate care delivery sites would be required. MEMS emerged in response to Title IV of The Defense against Weapons of Mass Destruction Act of 1996 (Public Law 104-201). The law required that the Secretary of Defense develop and carry out a program to improve the responses of Federal, State, and local agencies to emergencies involving biological and chemical weapons. In response, the U.S. Department of Defense (DOD) created the Biological Warfare Improved Response Program. DOD then invited the Departments of Health and Human Services (DHHS), Energy (DOE), and Agriculture (USDA), and the Federal Emergency Management Agency (FEMA), the Federal Bureau of Investigation (FBI) and the Environmental Protection Agency (EPA), as well as emergency responders and managers from multiple States and local communities, to participate. MEMS offers detailed standards for a system of care that can be expanded and contracted in modular units as the need arises. It provides a framework for the organization of care, particularly for setting up predetermined, special-use alternate care sites. Thus, MEMS answers the questions of what general kinds of care are provided and where (alternate site standards). In specifying the staffing required for alternate care sites, MEMS also addresses who will provide care. One of the underlying assumptions in MEMS is that resources will be brought in or created within the area most affected by the mass casualty event." (AHRQ, *Altered Standards of Care in Mass Casualty Events*, 2005, p. B-2)

Modular Organization (ICS): "The ICS organizational structure develops in a top-down fashion that is based on the size and complexity of the incident, as well as the specifics of the hazard environment created by the incident. When needed separate functional elements can be

established, each of which may be further subdivided to enhance management and coordination. Responsibility for the establishment and expansion of the ICS rests with the Incident Commander (IC), who bases these on requirements of the situation. As incident complexity increases, the organization expands from top down as functional responsibilities are delegated." (**FEMA**, *National Incident Management System National Standard Curriculum Training Development Guidance*. October 2005, p. 8)

MOM: Multi-Objective Management. (**Galloway**, *A California Challenge*, 2007, 32)

Moral Hazard: "…insured parties take greater risks because they know they are insured). Insurers try to minimize adverse selection by marketing insurance to a broad class of customers, and by charging higher premiums to higher risk customers.[85] Insurers can address moral hazard by imposing deductibles – or requirements that policyholders bear certain "first dollar" losses – before receiving insurance coverage. " (**Financial Services Roundtable**, *Nation Unprepared for Mega-Catastrophe*, 2007, 45)

Moral Hazard: "`Moral hazard' is an increase in the probability of loss that could be caused by the behavior of the policyholder. For example, providing insurance protection to an individual may lead that person to behave more carelessly than before." (**GAO**, *Natural Disasters*, Nov 2007, 2)

Mortgage Portfolio Protection Program (MPPP): The Mortgage Portfolio Protection Program (MPPP) was introduced on January 1, 1991, as an additional tool to assist the mortgage lending and servicing industries in bringing their mortgage portfolios into compliance with the flood insurance requirements of the Flood Disaster Protection Act of 1973. The MPPP is not intended to act as a substitute for the need for mortgagees to review all mortgage loan applications at the time of loan origination and comply with flood insurance requirements as appropriate. Proper implementation of the various requirements of the MPPP usually results in mortgagors, after their notification of the need for flood insurance, either showing evidence of such a policy, or contacting their local insurance agent or appropriate Write Your Own (WYO) company to purchase the necessary coverage. It is intended that flood insurance policies be written under the MPPP only as a last resort, and only on mortgages whose mortgagors have failed to respond to the various notifications required by the MPPP." (**FEMA**, *MPPP*, 2005)

MOU: Memorandum of Understanding. (**DA**, *WMD-CST Operations*, Dec 2007, Glossary-4)

MPC: Maximum Permissible Concentration. (**OCD**, *Abbreviations and Definitions*, 1971, 3)

---

[85] The FSR adds a footnote that "There is a limit, however, to addressing the adverse selection problem through pricing alone. As risk pools narrow to include only those presenting the highest risks, the actuarially appropriate premium may be so high that few will purchase the insurance. This may so increase the uncertainty about the expected loss from the risk pool that insurers become unable to price the risks correctly, or even become unwilling to provide any coverage at all. This is essentially why private insurers dropped out of covering flood risks…) (p. 45)

MTSA: Maritime Transportation Security Act of 2002. (**GAO**, *Maritime Security*, Dec 2007, iv)

Mudflow: "The down-slope transfer of fine earth material mixed with water." (**UNDHA**, *DM Glossary*, 1992, 54)

Multi-Agency Command Center MACC: "An interagency coordination center established by the Department of Homeland Security (United States Secret Service) during National Security Special Events as a component of the Joint Operations Center. The MACC serves as the focal point of interagency security planning and coordination." (**FEMA**, *Mission Assignment SOPs Operating Draft*, 2007, p. 55)

Multi-Agency Coordination (MAC): "A generalized term which describes the functions and activities of representatives of involved agencies and/or jurisdictions who come together to make decisions regarding the prioritizing of incidents, and the sharing and use of critical resources. The MAC organization is not a part of the on-scene ICS and is not involved in developing incident strategy or tactics." (**USCG**, *IM Handbook*, 2006, Glossary 25-15)

Multi-Agency Coordination (MAC) Centers: "A seventh requirement of incident management consists of the various multi-agency coordination centers that exist throughout all levels of government. They are essential to maintaining situational awareness and overall incident management, and they assist in the flow of information, the reporting of actions and activities, and ultimately the development of a common operating picture, but they also are hubs for coordinating operational activities during an incident. Examples include State, local, and Tribal emergency operations centers; State, local, and Tribal fusion centers; the National Operations Center, National Infrastructure Coordination Center, and the Federal Emergency Management Agency's National Response Coordination Center (all part of the Department of Homeland Security); the Federal Bureau of Investigation's Strategic Information and Operations Center and National Joint Terrorist Task Force (both part of the Department of Justice); and the National Counterterrorism Center (part of the Office of the Director of National Intelligence)." (**White House**, *National Strategy for Homeland Security*, HSC, October 2007, pp. 47-48)

Multiagency Coordination Entities. "When incidents cross disciplinary or jurisdictional boundaries or involve complex incident management scenarios, a multiagency coordination entity, such as an emergency management agency, may be used to facilitate incident management and policy coordination. The situation at hand and the needs of the jurisdictions involved will dictate how these multiagency coordination entities conduct their business, as well as how they are structured. Multiagency coordination entities typically consist of principals (or their designees) from organizations and agencies with direct incident management responsibility or with significant incident management support or resource responsibilities. These entities are sometimes referred to as crisis action teams, policy committees, incident management groups, executive teams, or other similar terms." (**DHS**, *NIMS*, 2004, pp. 27-28)

Multi-agency Coordination (MAC) Group: "Typically, administrators/executives, or their appointed representatives, who are authorized to commit agency resources and funds, are

brought together and form MAC Groups. MAC Groups may also be known as multiagency committees, emergency management committees, or as otherwise defined by the System. It can provide coordinated decisionmaking and resource allocation among cooperating agencies, and may establish the priorities among incidents, harmonize agency policies, and provide strategic guidance and direction to support incident management activities." (**FEMA**, *NIMS*, 2007, 154)

Multiagency Coordination System (MACS). "The primary function of MACS is to coordinate activities above the field level and to prioritize the incident demands for critical or competing resources, thereby assisting the coordination of the operations in the field. MACS consists of a combination of elements: personnel, procedures, protocols, business practices, and communications integrated into a common system. For the purpose of coordinating resources and support between multiple jurisdictions, MACS can be implemented from a fixed facility or by other arrangements outlined within the system. Examples of multiagency coordination include a State or county emergency operations center, a State intelligence fusion center, the National Operations Center, the Department of Homeland Security/Federal Emergency Management Agency (FEMA) National Response Coordination Center, the Department of Justice/Federal Bureau of Investigation (FBI) Strategic Information and Operations Center, the FBI Joint Operations Center, and the National Counterterrorism Center." (**DHS,** *NRF*, 2008, 48)

Multi-agency Coordination System(s) (MACS): "Multiagency coordination systems provide the architecture to support coordination for incident prioritization, critical resource allocation, communications systems integration, and information coordination. The elements of multiagency coordination systems include facilities, equipment, personnel, procedures, and communications. Two of the most commonly used elements are EOCs and MAC Groups. These systems assist agencies and organizations responding to an incident." (**FEMA**, *NIMS Draft*, 2007, p. 154)

Multi-Agency Coordination System (MACS) DHS – Concepts and Principles: "The core concepts and principles of the Multi-Agency Coordination System as taught by DHS (and as defined in the NIMS Document) incorporate the following components:

- A multi-agency coordination system is a combination of facilities, equipment, personnel, procedures, and communications integrated into a common system with responsibility for coordinating and supporting domestic incident management activities.
- The primary functions of multi-agency coordination systems are to support incident management policies and priorities, facilitate logistics support and resource tracking, inform resource allocation decisions using incident management priorities, coordinate incident management related information, and coordinate interagency and intergovernmental issues regarding incident management policies, priorities, and strategies.
- A typical multi-agency coordination system may contain one or several Emergency Operations Centers (EOCs). A typical multi-agency coordination system may contact numerous Department Operations Center (DOCs). Depending upon the type and location of the emergency/disaster various command elements (i.e. area commands, unified command or the incident commander) will have to coordinate activities within an established multi-agency coordination system.

Training dealing with the NIMS multi-agency coordination system shall describe to participants the components of a multi-agency coordination system and establish relationships between all elements of the system. It shall also increase the participant's knowledge of NIMS relevant to the multi-agency coordination system. It shall increase the participant's knowledge of the integrated nature of emergency management throughout the nation and advocate the adoption of the guidelines established in the NIMS document. The training shall contain specific disaster/emergency related examples that relate to multi-agency coordination systems at the local, state and federal levels of government." (**FEMA**, *National Incident Management System National Standard Curriculum Training Development Guidance*, October 2005, pp. 22-23)

Multi-Casualty/Multi-Patient Incident Plan (Multiple Casualty/Multiple Patient IP) (MCI/MPI): "An effective …MCI/MPI plan should include all of the health and medical resources within a local area/region. Significant components of an MCI plan include EMS, private ambulance providers, fire department, law enforcement, hospitals, medical education facilities, and public health capabilities. Freestanding minor emergency treatment centers/clinics should be included in the plan as well." (USFA, *Responding to Incidents of National Consequence*, 2004, p. 53)

Multi-hazard: "Multihazards include significant events such as infrastructure deterioration, natural disasters, accidents, and malevolent acts." (**TISP**, *Regional Disaster Resilience*, 2006, 2)

"Today's preparedness needs require a comprehensive, multihazards regional approach that addresses natural disasters of all types, human error, systems failures, pandemics, and malevolent acts, including those involving cyber systems and weapons of mass destruction (chemical, biological, radiological, and nuclear devices)." (**TISP**, *Regional Disaster Resilience*, 2006, p. 3)

Multihazard Advisory Maps: "In this subsection, the term 'multihazard advisory map' means a map on which hazard data concerning each type of natural disaster is identified simultaneously for the purpose of showing areas of hazard overlap." (**Disaster Mitigation Act of 2000**, Title I, Sec. 203 (k))

Multihazard Mitigation Council (MMC): "The purpose of the Multihazard Mitigation Council (MMC) is to reduce the total costs associated with natural and other related hazards to buildings by fostering and promoting consistent and improved multihazard risk mitigation strategies, guidelines, practices, and related efforts. The Council was established in 1997 as a voluntary advisory, facilitative body of the National Institute of Building Sciences (NIBS), a nonprofit corporation incorporated in the District of Columbia." (FEMA, "Fact Sheet – Mitigation's Value to Society," August 2007, p. 2)

Multi-jurisdiction Incident: "An incident that extends across political boundaries and/or response disciplines, requiring action from multiple governments and agencies to manage certain aspects of an incident. These incidents may best be managed under Unified Incident Management." (**HHS**, *Medical Surge Capacity and Capability Handbook*, August 2004, p. D-8)

Multi-Objective Floodplain Management: "Within the field of floodplain management, ecosystem restoration is becoming increasingly important with the emphasis upon *multi-*

objective floodplain management. Rather than just focusing upon "flood control" to protect lives and property, proactive floodplain management strives to consider multiple objective alternatives in order to determine the best overall strategy for any given location." (**CA Department of Water Resources**, *Multi-Objective Approaches to Floodplain Mgmt*., 2005, 1)

Multi-Year Development Plan (MYDP): "Multi-Year Development Plan – presents a step-by-step procedure for estimating (a) total resource requirements for alleviating shortfalls that the jurisdiction plans to address at some point in the future, (b) additional capability development activities not identified in the Capability Assessment, and (c) major maintenance efforts. The MYDP also enables a local jurisdiction to plan in more detail for specific capability improvement activities where work will actually begin in the upcoming year. Finally, the MYDP asks for information on actual expenditures during the most recent local fiscal year which will be used to project what it will cost to maintain capability at current levels." (**FEMA**, *IEMS, HICA MYDP* (CPG 1-34), 1985, p. II-1)

Multi-Year Development Plan (Planning) (MYDP): "Based on…capability shortfall [analysis]…the jurisdiction should prepare a multi-year development plan tailored to meet its unique situation and requirements. The plan should outline what needs to be done to reach the desired level of capability. Ideally, this plan should cover a five-year period so that long-term development projects can be properly scheduled and adequately funded. The plan should include all emergency management projects and activities to be undertaken by the jurisdiction regardless of the funding source." (**FEMA**, *IEMS Process Overview*, 1983, pp. 8-9)

Multi-Year Development Plan (Planning) (MYDP): "…the MYDP at all levels of government is a planning document. As such, information forwarded to FEMA Headquarters will be used as one basis for planning and projecting budgetary requirements at the national level. In a similar fashion at other levels of government, the MYDP can serve as a useful planning and management tool that allows emergency managers to project (or provide an initial estimate of) how they wish to approach improvement of identified capability shortfalls over time and to estimate levels of assistance that may be required to aid them in capability building and maintenance efforts." (**FEMA**, *IEMS MYDP*, 1984, p. I-3)

Multi-Year Exercise Schedule: "… should identify all exercises planned by a state/region/jurisdiction within a long term timeframe. Planners should use this to deconflict and synchronize their exercise efforts in terms of resources and objectives - combining exercises, where appropriate and more efficient." (**FEMA**, IS-120 A, *An Intro to Ex.*, 23 Jan 2008, p. 19)

Multi-Year Flood Hazard Identification Plan (MHIP): "The Multi-Year Flood Hazard Identification Plan (MHIP) details FEMA's plan for prioritizing and delivering modernized flood maps for areas of the United States with the greatest flood risk. The MHIP provides: detailed tables and graphs of projected flood map production sequencing and projected funding allocations; a summary of stakeholder input, including information provided through business plans developed by FEMA Regional Offices and State mapping partners; and a summary of FEMA's progress in meeting Key Performance Indicators for the Flood Map Modernization program." (**FEMA/NFIP**, *Multi-Year Flood Hazard Identification Plan* (Version 2.5), 2007)

Multi-Year Strategy and Program Management Plan: "A process that ensures the maintenance and continued viability of COOP plans.**"** (**DHS**, *FCD 1*, Nov 2007, P-6)

Multi-Year Training & Exercise Plan: "The Multi-Year Training and Exercise Plan is the *foundational* document guiding a successful exercise program. The multi-year plan provides a mechanism for long-term coordination of training and exercise activities toward a jurisdiction's *preparedness* goals. This plan describes the program's training and exercise priorities and associated *capabilities*, and aids in employing the *building-block approach* for training and exercise activities. Within the Multi-Year Training and Exercise Plan, the multi-year schedule graphically illustrates training and exercise activities that support the identified priorities. The schedule is color-coded by priority and presents a multi-year outlook for task and priority achievement. As training and exercises are completed, the document can be annually updated, modified, and revised to reflect changes to the priorities and new capabilities that need to be assessed. The Multi-year Training and Exercise Plan and schedule is produced through the work completed at the *Training and Exercise Plan Workshop (T&EPW)*. The T&EPW focuses on discussion of *capabilities-based planning*, overview of the National Priorities, review of the State or jurisdiction priorities, and analysis of previous training and exercises. After this information is synthesized, *participants* develop the plan and schedule for their State or jurisdiction." (**FEMA**, *HSEEP Glossary*, 2008)

Multi-Year Training & Exercise Plan:

- Takes stock of current program plans and capabilities.
- Lays out long-term program goals and objectives.
- Develops a mix of exercises to meet goals and objectives.
- Determines what training is needed as a prerequisite to planned exercises.
- Sets a multiyear schedule of exercises.
- Sets a multiyear schedule of training events. (**FEMA**, IS-120 A, *An Introduction to Exercises*, 23 Jan 2008, p. 17)

Multiple Direction Planning: "Federated planning flows in multiple directions. From a municipal leader's perspective it begins locally, processes up through State, regional, and Federal authorities as necessary, and comes back. Local leaders assess their threats, hazards, and risk posture and determine what actions and capabilities are required to achieve steady-state and incident security. They resource what they can and petition State and Federal authorities to fill capability shortfalls as needed.

1) In between, State officials often establish planning assumptions and objectives with which local governments in the State are required or encouraged to adopt and support. State-wide interoperable communications plans and systems are an example. State governments exercising leadership in a complex competitive environment relegate local and Federal government officials to a supporting role.

2) At every level of government, officials set strategic goals and objectives for their jurisdictions. They also examine how their security challenge fits with higher, lower, and adjacent jurisdictions. They determine how to operationalize their own and other relevant

strategies, and resource appropriately. Federated planning constitutes an approach where each member of the homeland security community is supporting and supported by others." (**FEMA**, *(Interim) Integrated Planning System (IPS) for Homeland Security (Draft Version 2.3)*, July 3, 2008 copy, p. 2-3)

Mustard Gas: "Sulfur mustard is a type of chemical warfare agent. These kinds of agents are called vesicants or blistering agents, because they cause blistering of the skin and mucous membranes on contact. Sulfur mustard is also known as "mustard gas or mustard agent," or by the military designations H, HD, and HT. Sulfur mustard sometimes smells like garlic, onions, or mustard and sometimes has no odor. It can be a vapor (the gaseous form of a liquid), an oily-textured liquid, or a solid. Sulfur mustard can be clear to yellow or brown when it is in liquid or solid form." (**CDC**, *Facts About Sulfur Mustard*, March 12, 2003 Modification)

Mutual Aid Agreement: "A written agreement between agencies, organizations, and/or jurisdictions that they will assist one another on request by furnishing personnel, equipment, and/or expertise in a specified manner." (**DHS**, *National Response Plan*, December 2004, p.69; **DHS**, *National Incident Management System*, March 2004, p. 133.)

Mutual Aid: "Mutual-aid agreements are the means for one jurisdiction to provide resources, facilities, services, and other required support to another jurisdiction during an incident. Each jurisdiction should be party to a mutual-aid agreement with appropriate jurisdictions from which they expect to receive or to which they expect to provide assistance during an incident." (**DHS**, *National Incident Management System*, March 2004, p. 5)

Mutual Aid Agreement: "Written agreement between agencies, organizations, and/or jurisdictions that they will assist one another on request by furnishing personnel, equipment, and/or expertise in a specified manner." (**FEMA**, *Mission Assignment SOPs Draft*, 2007, p. 55)

Mutual Aid Agreement: "Pre-arranged agreement developed between two or more entities to render assistance to the parties of the agreement." (**ISO 22399**, *Societal Security*…, 2007, 4)

Mutual Aid Agreements: "**A.5.7** Mutual aid/assistance agreements between entities are an effective means to obtain resources and should be developed whenever possible. Mutual aid/assistance agreements should be in writing, be reviewed by legal counsel, be signed by a responsible official, define liability, and detail funding and cost arrangements. The term *mutual aid/assistance agreement* as used here includes cooperative assistance agreements, intergovernmental compacts, or other terms commonly used for the sharing of resources. Mutual aid/assistance agreements are the means for one entity to provide resources, facilities, services, and other required support to another entity during an incident. Each entity should be party to a mutual aid/assistance agreement (such as the Emergency Management Assistance Compact) with appropriate entities from which they expect to receive or to which they expect to provide assistance during an incident. This would normally include all neighboring or nearby entities, as well as relevant private sector and nongovernmental organizations. States should participate in interstate compacts and look to establish intrastate agreements that encompass all local entities. Mutual aid/assistance agreements are also needed with private organizations, such as the International Red Cross, to facilitate the timely delivery of private assistance at the

appropriate entity level during incidents. At a minimum, mutual aid/assistance agreements should include the following elements or provisions:

(1) Definitions of key terms used in the agreement
(2) Roles and responsibilities of individual parties
(3) Procedures for requesting and providing assistance
(4) Procedures, authorities, and rules for payment, reimbursement, and allocation of costs
(5) Notification procedures
(6) Protocols for interoperable communications
(7) Relationships with other agreements among entities
(8) Workers' compensation
(9) Treatment of liability and immunity
(10) Recognition of qualifications and certifications
(11) Sharing agreements, as required." (**NFPA 1600**, 2007, p. 16; DHS, *NRF*, 2008, 38)

[Note: FEMA *NIMS* adds a 12th element (or provision) – "Termination Clause." (FEMA 501/Draft), August 2007, p. 18.]

MWEOC: Mount Weather Emergency Operations Center. (**FEMA**, *About FEMA*, 2007)

MYDP: Multi-Year Development Planning. (**FEMA**. *IEMS: MYDP,* 1984, p. 1-1)

9-1-1 Centers and EOCs: "The assumption that the duties identified as fundamental to an Emergency Operations Center dismisses the fact that the 9-1-1 Center, in many locations, performs these duties well in advance of any EOC activation. The information to and from the public, local/county field units, outside agency responders, related state and federal agencies as well as medical and health resources begins at the PSAP/Public Safety Communication Center." (**Association of Public Safety Communications Officials**. *APCO Homeland Security Commitment.* National Homeland Security Consortium Meeting, May 24-25, 2005, slide 5)

N+1: "A fault tolerant strategy that includes multiple systems or components protected by one backup system or component. (Many-to-one relationship)." (**DigitalCare**, *State of OR Business Continuity Workshop*, 2006, 60)

NAC: National Advisory Committee (FEMA).

NACCHO: National Association of County and City Health Officials.

NAIC: National Association of Insurance Commissioners. (**FEMA**, *Call for Issues*, 2000, xxiii)

Named Storm: "Named Storm – (NS) A hurricane or a tropical storm." (**Klotzbach and Gray**, *Extended Range Forecast of Atlantic Seasonal Hurricane Activity and U.S. Landfall Strike Probability for 2008*, April 9, 2008, p. 6)

NARAC: National Atmospheric Release Advisory Center. **(LLNL,** *GT&S*, 2006, p. 21)

NAS: National Academy of Sciences

NASCDD: National Association of Civil Defense Directors. (**OCD**, *Abbreviations*, 1971, 3)

NASEMSO: National Association of State Emergency Medical Services Officials.

National Academic Consortium for Homeland Security (NACHS): "The goal of the National Academic Consortium for Homeland Security is to help improve the security of the U.S. and its worldwide interests, while protecting and preserving its values, freedoms and civil liberties, and economic interests and competitiveness. The specific objectives of the Consortium are to help:
(1) Improve understanding of national security issues, especially terrorism and strategies for counter-terrorism;
(2) Promote development of better-informed public policy, strategy, plans and programs regarding national security issues;
(3) Develop new technologies and transition those technologies into effective, practical and affordable solutions to (current and future) international and homeland security problems; and
(4) Educate and train the people required by governmental and non-governmental organizations, to effectively accomplish international and homeland security roles and responsibilities.
The primary role of the Consortium is to promote, support and enhance academic research, technology development, education and training, and service programs dealing with all aspects of international and homeland security, through collaboration and information- sharing among academic institutions, researchers and scholars. Our vision is that the Consortium also becomes an effective sounding board and consultative body to assist federal-government decision makers in developing more effective national policies and programs concerning academic research and technology development, education and training, and related service programs pertaining to national security. (**NACHS**, The Ohio State University)

National Advisory Council for Rural Civil Defense: Established by the Federal Civil Defense Administration in December 1955. (**FCDA**, *1956 Annual Report*, 1957, 108)

National Air & Radiation Environmental Laboratory (NAREL): "The National Air and Radiation Environmental Laboratory (NAREL) is a comprehensive environmental laboratory managed by the U.S. Environmental Protection Agency's Office of Radiation and Indoor Air (ORIA). NAREL is located on the Gunter Annex of Maxwell Air Force Base in Montgomery, Alabama, and provides services to a wide range of clients, including other EPA offices and Federal and State agencies. NAREL facilities incorporate state-of-the-art laboratory technology and equipment and include the latest health and safety techniques, as well as strict monitoring and control of laboratory emissions. The NAREL staff are highly trained professionals with backgrounds including health physics, radiochemistry, engineering, biology, mathematics, and computer science. Fundamental to the NAREL mission is the commitment to developing and

applying the most advanced methods for measuring environmental radioactivity and evaluating its risk to the public." (**EPA**, *NAREL*, Feb 13, 2008 Update)

National Alert Warning System (NAWAS): "Operated and maintained by FEMA, the NAWAS was originally created as part of the Civil Defense Act of 1950 in order to pass emergency information to the American public regarding an actual attack or an accidental missile launch against the United States. The NAWAS is available on a 24/7 basis as a non-secure, continuous, private line, telephone system and is used to convey warnings to Federal, State, and local governments, as well as the military and civil populations. Although the original mission of NAWAS was to warn of an enemy attack or missile launch, the Robert T. Stafford Disaster Relief and Emergency Assistance Act of 1974 expanded the NAWAS mission to include warning for acts of terrorism, as well as natural and technological disasters and events. NAWAS is used by the National Oceanic and Atmospheric Administration (NOAA) to pass severe weather alerts as conditions develop as well and to pass critical sheltering information in the event these severe weather conditions materialize. There are currently approximately 2050 NAWAS drops (referred to as Warning points) across the Nation, to include Alaska, Hawaii, Puerto Rico, and the US Virgin Islands" (**Homeland Security Council**, *NCPIP*, 2007, p. 64)

National Asset Database (NADB): "…the National Asset Database (NADB) is not a list of critical assets assembled into a database of only those assets (facilities, systems, and infrastructures) deemed 'critical'. The NADB is the primary Federal data repository for analysis and integration required to provide the Department of Homeland Security (DHS) with the capability to identify, collect, catalog, and maintain a national asset inventory…..The NAPB is a continually evolving and comprehensive catalog of the assets that comprise the Nation's infrastructure; containing descriptive information regarding those assets. Since the NAPB is an inventory of assets, it can be queried in many ways that can help inform public and private risk-reduction activities across the 17 Critical Infrastructures and Key Resources (CI/KR) sectors. It provides the 'universe' from which various lists of critical assets are produced. The NADB enables a wide-ranging robust risk analysis process that ties asset information, as well as analyses concerning consequence of loss/attack, vulnerability of an asset, system or network, to the threat to those assets, systems, or networks." (**DHS/OIG**, *Progress in Developing the National Asset Database*, "Response to Recommendations Contained in the Draft OIG Report" (DHS), June 2006, p. 29)

National Applications Office. See Department of Homeland Security, National Appl. Office.

National Atmospheric Release Advisory Center (NARAC): "The National Atmospheric Release Advisory Center (NARAC), located at Livermore, is the premier capability in the U.S. for real-time assessments of the dispersion and potential impact of hazardous materials released into the atmosphere. NARAC provides the technical, scientific, and operational capabilities for the DHS-led Interagency Modeling and Atmospheric Assessment Center (IMAAC), which serves as the coordinating center and single source of federal plume-modeling predictions in the event of a nationally significant incident." (**LLNL**, *Global Treats and Security*, 2006, p. 21)

National Biodefense Science Board (NBSB): "The National Biodefense Science Board (NBSB) was created under the authority of the Pandemic and All-Hazards Preparedness Act,

signed into law on December 19, 2006. NBSB was established to provide expert advice and guidance to the Secretary of the U.S. Department of Health and Human Services (HHS) on scientific, technical, and other matters of special interest to HHS regarding activities to prevent, prepare for, and respond to adverse health effects of public health emergencies resulting from chemical, biological, nuclear, and radiological events, whether naturally occurring, accidental, or deliberate. By statute, the NBSB will have 13 voting members with a broad range of expertise in science, medicine, and public health. Additionally, there may be non-voting, ex officio members, as determined appropriate by the Secretary." The Inaugural Meeting of the NBSB was December 17-18, 2007. (**HHS/ASPR**, *National Biodefense Science Board*, 2007)

National Biosurveillance Integration Center (NBIC): See DHS NBIS.

National Biosurveillance Integration System (NBIS): "HSPD-9 dated 30 January 2004 and HSPD-10 dated 21 April 2004 directs DHS to establish a National Biosurveillance Integration System (NBIS) to provide early detection and situational awareness of biological events of potential national consequence by acquiring, integrating, analyzing, and disseminating existing human, animal, plant, and environmental biosurveillance system data into a common operating picture (COP) that represents a comprehensive depiction of the global biosurveillance security environment (GBSE). The National Biosurveillance Group (NBSG), comprising of representatives from all member agencies, will integrate and analyze all-agency/source biosurveillance information to recognize unusual biological events and provide situational awareness to the NBIS community and decision-makers through the development of a biosurveillance COP (BCOP) and targeting reporting. The BCOP will augment the DHS National Operation Center's COP, which provides a consistent, integrated picture of biosurveillance situational awareness throughout the country. The NBIS will facilitate collaborative interagency analysis to ensure fully-integrated biosurveillance situational awareness and provide near-real time awareness to the Incident Management Group (IMG) and the DHS National Operations Center (NOC). The resulting improved information sharing and enhanced situational awareness facilitates national decision-making to enable timely response." (**DHS**, *DHS Exhibit 300 Public Release BY08*, February 12, 2007, p. 1).

National Biosurveillance Integration System (NBIS): In FY 2006 there were 493 "bioaerosol collectors deployed in the U.S. cities determined to be at the highest risk. These collectors serve to determine the characteristic and extent of a potential terrorist airborne health threat to the public and protect the public by enabling early response actions to identification of airborne materials in the event of an attack." The goal for FY 2007-08 was 660. (**DHS**, *Performance Budget Overview, FY 2008*, March 2007, p. 23)

National Biosurveillance Integration System Operational Display System (NODS): "…an IT system that provides our Center [NBIC] the visibility into over 300-plus unclassified sources of biosurveillance information from across multiple sources. This information is aggregated with various reports that we receive from the departments of Defense, State, Health and Human Services, Agriculture, and Transportation and other sources. Our relationship and integration of such valuable sources, such as ARGUS is firmly established within NODS." (**DHS**, *Testimony of Dr. Kimothy Smith…NBIC...,* 4 Oct 2007)

National Bioterrorism Hospital Preparedness Program (NBHPP): "The purpose of the National Bioterrorism Hospital Preparedness Program (NBHPP) is to prepare hospitals and supporting healthcare systems, in collaboration with other partners, to deliver coordinated and effective care to victims of terrorism and other public health emergencies. Cooperative agreement funds may be used for activities that include increasing surge capacity, which encompasses beds, personnel, pharmaceuticals, PPE, decontamination capacity, isolation capacity and interoperable communications, as well as the enhancement of EMS services, competency based training, and exercises." (**DHS/ODP**, *FY 2006 EMPG*, 2005, p. 11)
[Note: "The Pandemic and All Hazards Preparedness Act of 2006 (PAHPA) transferred the National Bioterrorism Hospital Preparedness Program (NBHPP) from the Health Resources and Services Administration (HRSA) to the newly created office of the Assistant Secretary for Preparedness and Response (ASPR), and the NBHPP was renamed the Hospital Preparedness Program (HPP). In addition to the new name, the program's focus expanded from bioterrorism to all-hazards preparedness. Under PAHPA, the following capabilities must be prioritized:

- Interoperable communications system;
- Fatality management plans;
- Bed tracking system;
- Hospital evacuation plans;
- Emergency System for the Advance Registration of Volunteer Health Professionals;
- National Incident Management System (NIMS) compliance." (**Trust for America's Health**, *Ready or Not?* 2007, p. 65)]

National Biosurveillance Watch Desk: Operates 24/7 within the National Operations Center (NOC), which first stood up in December 2005. (**DHS**, *Testimony of Dr. Kimothy Smith…NBIC.* 4Oct07)

National Capabilities Assessment: "The Office of Grants and Training [DHS] is developing a National Capabilities Assessment through iterative pilot testing. Objectives:

1. Facilitate understanding of regional preparedness through:
    a. Extensive participation of Federal, State, territory, local, and tribal multi-disciplinary partners
    b. Regional collaboration
    c. Measuring preparedness through 'real-world' performance
    d. Identifying capability gaps to be closed, and programs to sustain
    e. Findings that can be used to update strategies and program plans
2. Develop a national picture of preparedness to:
    a. Support strategic decision-making on delivery of preparedness programs
    b. Measure progress in preparedness
    c. Evaluate and update national priorities
    d. Identify research and development requirements
3. Create a better assessment that:
    a. Incorporates feedback to improve the assessment's usefulness
    b. Helps refine to Target Capabilities List (TCL) (**DHS**, *Development of the CAPS*, 2006, slide 9)

- What the Assessment IS

  - Translation of thee TCL from policy to application of a National Capabilities Assessment
  - Focused on capability outcomes
  - Mechanism to encourage regional collaboration
  - Focused on state and local preparedness
  - Enhances 'culture of preparedness'
  - Leverages experience of previous assessments (avoiding pitfalls)
- What the assessment is NOT
  - A detailed accounting of individual assets
  - A internal jurisdiction or departmental analysis (**DHS**, *Development of the CAPS*, 2006, slide 10)

National Capabilities Assessment Pilot: "Pilot strives to develop an assessment that is:
- Systematic
- Repeatable
- Consistent
- Useful (**DHS**, *Development of the CAPS*, 2006, slide 11)

National Capital Region (NCR): "Title 10, United States Code, Section 2674 (f)(2) provides the following definition: *The term "National Capital Region" means the geographic area located within the boundaries of (A) the District of Columbia, (B) Montgomery and Prince Georges Counties in the State of Maryland, (C) Arlington, Fairfax, Loudoun, and Prince William* Counties and the City of Alexandria in the Commonwealth of Virginia, and (D) all cities and other units of government within the geographic areas of such District, Counties, and City. Section 7302(a)(7) of the Intelligence Reform and Terrorism Prevention Act of 2004 (Pub. L. 108-458), December 17, 2004, has since amended the definition of the National Capital Region: The term "National Capital Region" or "Region" means the area defined under section 2674(f)(2) of title 10, United States Code, and those counties with a border abutting that area and any municipalities therein. However, the Homeland Security Act of 2002 limits the purview of the NCRC's oversight and coordination function within the boundaries of the NCR as defined under section 2674(f)(2) of title 10, United States Code." (**DHS**, *National Capital Region Coordination, First Annual Repor*t, 2005, p. 1)

National Capital Region (NCR): "The National Capital Region was created pursuant to the National Capital Planning Act of 1952… The Act defined the NCR as the District of Columbia; Montgomery and Prince George's Counties of Maryland; Arlington, Fairfax, Loudon, and Prince William Counties of Virginia; and all cities now or here after existing in Maryland or Virginia within the geographic area bounded by the outer boundaries of the combined area of said counties. The NCR includes the District of Columbia and eleven local jurisdictions in the State of Maryland and the Commonwealth of Virginia." (**HSC**, NCPIP, 2007, p. 64)

National Center for Biomedical Research and Training – Academy of Counter-Terrorist Education (NCBRT-ACE) at Louisiana State University (LSU**)**: "NCBRT-ACE specializes in curriculum on biological terrorism agents and topics in the law enforcement discipline, including prevention and deterrence. The biological curriculum is based on completed and ongoing studies on agents, such as anthrax, through a bio-safety level 3 laboratory." (**FEMA**, *TEI/TO*, 2008, 4)

National Center for Food Protection and Defense (NCFPD): A Department of Homeland Security Center of Excellence, "… led by the University of Minnesota…defends the safety of the food system from pre-farm inputs through consumption by establishing best practices, developing new tools, and attracting new researchers to prevent, manage, and respond to food contamination events." (**DHS**, *Homeland Security Centers of Excellence*, March 20, 2007)

National Center for Foreign Animal and Zoonotic Disease Defense (FAZD): A Department of Homeland Security Center of Excellence, "led by Texas A&M University, protects against the introduction of high-consequence foreign animal and zoonotic diseases into the United States, with an emphasis on prevention, surveillance, intervention, and recovery." (**DHS**, *Homeland Security Centers of Excellence*, March 20, 2007)

National Center for Preparedness, Detection, Control of Infectious Diseases (NCPDCID) CDC: "The…NCPDCID protects populations domestically and internationally through leadership, partnerships, epidemiologic and laboratory studies, and the use of quality systems, standards, and practices. NCPDCID collaborates with the Coordinating Center for Infectious Diseases (CCID), CDC, and the agency's national and global partners to conduct, coordinate, and support infectious disease surveillance, research, and prevention. Each of the center's 6 divisions complements this cross-cutting mission, working with internal and external partners to improve public health." (**CDC**, *NCPDCIC*, January 23, 2008 update)

National Center for the Study of Preparedness and Catastrophic Event Response (PACER): A Department of Homeland Security Center of Excellence, "led by Johns Hopkins University, optimizes our Nation's preparedness in the event of a high-consequence natural or man-made disaster, as well as develops guidelines to best alleviate the effects of such an event." (**DHS**, *Homeland Security Centers of Excellence*, March 20, 2007)

National Civil Applications Program (NCAP): "The National Civil Applications Program (NCAP) is a component of the U.S. Geological Survey's (USGS) Mapping, Remote Sensing, and Geographic Investigations Program. The NCAP serves Federal civil agencies by providing for the acquisition, dissemination, and exploitation of classified remote sensing systems and data in support of mission responsibilities for land and resource management, environmental and scientific studies, homeland security, and hazards/disaster management.

"Civil applications of classified remotely sensed imagery began in 1969 when the USGS provided Federal civil agencies with access to imagery for various uses, including mapping, charting, geodesy, and management of the Nation's lands and resources. The Civil Applications Committee (CAC) was established in 1975 to provide oversight and coordination of these activities. The CAC is composed of 11 Federal departments and independent agencies. The USGS, through the Secretary of the Interior, is delegated responsibility to chair the CAC.

"The use of classified remotely sensed data has increased dramatically over the past 10 years. There has been an expanded emphasis on using data for environmental monitoring and research and for hazards detection, warning, and emergency response. To address the growing requirements and better serve the Federal civil community, the USGS expanded its investment in

NCAP facilities and infrastructure during the l990s. The USGS Advanced Systems Center (ASC) in Reston, Va., was built in 1993 and serves as the hub of NCAP operations. The USGS operates regional facilities in Denver, Colo.; Rolla, Mo.; Sioux Falls, SD; and Menlo Park, Calif. An interagency NCAP facility is located in Anchorage, Alaska. Each USGS facility provides the infrastructure, systems, and expertise required to support the growing diversity of civil applications." (**USGS**, *NCAP USCG Fact Sheet 121-02*, November 2002)

National Civil Defense Advisory Council: "During 1955 the National Civil Defense Advisory Council met five times…. The National Civil Defense Advisory Council was established by Publi Law 920 to advise the Administrator on general or basic policy matters of the civil defense program. The Council is appointed by the President. The Federal Civil Defense Administrator is chairman, half of the 12 membe3rs are representatives of State and local governments, and the remainder are appointed from the general public on the basis of their qualifications and interest." (**FCDA**, *1955 Annual Report*, 1956, p. 54)

National Civil Defense Four Major Principles, FCDA (1951-1952):

- A Well-Informed Public.
- A Trained Civil Defense Corps.
- Adequate Tools to Do the Job.
- A High State of National Readiness. (**FCDA**, *Annual Report for 1952*, p. 7)

National Civil Defense Training Center, Olney, MD. The first training school initiated by the Federal Civil Defense Administration, 1951.

National Civil Defense Training Center, Olney, MD: "The National Civil Defense Training Center at Olney, Md., consists of two training schools – the Staff College for training in Civil Defense Administration and Operations, and the Rescue School, for training in civil defense rescue operations and related skills such as emergency action to save lives and fire fighting for householders….

"The graduates from FCDA schools return to their home communities where they serve as a cadre of instructors, which multiplies itself by conducting local civil defense schools and courses.

"Both centers also helped plan the administrative, operational, and technical aspects of civil defense at State and local levels. Likewise, each center has served as an actin-research base in which developing policy was interpreted to representatives from the field and tested utilizing their own experiences.

"The school at Olney has become a center not only for instructing civil defense volunteers but also for developing and testing doctrine and devices useful in civil defense. It has also become a public education medium of some importance, particularly through its night exercises which are open to the public. These exercises constitute training activities in which both the Staff College and rescue students pactice and apply what they learned; with units from the fire departments and first-aid squads of nearby municipalities participating. About 10,000 people have observed

these night training exercises in which control center operations are used. Civil defense services units are dispatched to the rescue street, and live 'casualties' extircated under highly realistic fire and rescue situatins. Such exercised have demonstrated to civil defense officials and the public the progress that has taken place and how the services work together.

"During 1953, the Staff College graduated 470 trainees – State and municipal civil defense directors, civil defense service chiefs, civil defense coordinators in industrial organizations and government installations, and others. These trainees came from 31 States, 5 Territories, and foreign countries such as Canada and Brazil. In addition approximately 1,700 persons attended courses and conferences at the Staff College.

"The Staff College also assisted State and local officials by making available material, based on the units of instruction at the Staff College, and by lending personnel to assist in carrying on training or conferences at the State or local level….

A high degree of realism is achieved in rescue training by using a 'Rescue Street' with 5 demolished buildings where wartime rescue conditions are simulated. Trainees learn rescue methods and perform actural rescue operations in these buildings, wich duplicate conditions resulting from enemy attack or natural disaster." (FCDA, 1953 Annual Report, pp. 89-91)

National Civil Preparedness Program: In 1972 the Defense Civil Preparedness Agency was formed [See Defense Civil Preparedness Agency listing]. The DCPA instituted a National Civil Preparedness Program which differed from the existing Federal Civil Defense Program in two major respects: (1) a focus on peacetime natural, technological and man-made hazards, and (2) a movement away from a Federally-focused nuclear attack preparedness program to one focused on building local community preparedness capabilities for all hazards. As the DCPA put it, the new NCPP would begin transitioning to a "Civil Preparedness" program that was "people-oriented" as opposed to the "hardware-oriented" programs of the 1950s and 1960s. This reorientation included a "transition from nationwide exercises involving State and local governments to individualized exercises for selected local governments." (**DCPA**, *Foresight*, 1974, p. 13) "During the year Staff College [DCPA Staff College, Battle Creek MI] resident courses were redirected to increase the capability of local government to conduct emergency operations in an attack on any other emergency situation." (**DCPA**, *Foresight*, 1974, p. 20)

"In support of fiscal year 1973 program emphasis, additional materials were developed for use by State and Civil Defense University Extension personnel in natural disaster training programs. The first Natural Disaster Course Syllabus was made available in January 1973 [The Local Disaster Preparedness course]." (**DCPA**, *Foresight*, 1974, p. 20)

National Command and Coordination Capability (NCCC): "…a national crisis communications capability that is reliable and survivable with robust processes and systems that will serve command, control and coordination operations among federal, state, tribal, territories, and local governments. In a crisis, it will enable the President and other national leaders to make informed decisions, and coordinate efforts appropriately. The NCCC offers an interconnectivity solution inclusive of Katrina Lessons Learned recommendations. DHS has been designated the executive agent for coordinating the development, operation, and maintenance of the NCCC,

with support from the Department of Defense and the interagency community." (**DHS**, *Budget-in-Brief FY 2008*, 2007, p. 82)

National Command and Coordination Capability (NCCC): "The NCCC is the means to provide the President and Vice President with the ability to respond deliberately and appropriately to any crisis. It includes responsive, reliable, survivable, and robust processes and systems to command, control, and coordinate operations among Federal, State, tribal, insular, and local governments, as required. (**Homeland Security Council**, NCPIP, Aug 2007, p. 65)

National Commission on Terrorism: Non-partisan commission established by Congress in 1988 in the wake of the attacks on the US embassies in Nairobi and Dar es Salaam to conduct a six month study of U.S. policies to combat international terrorism. Chaired by Ambassador L. Paul Bremer. Led to production of *Countering the Changing Threat of International Terrorism.* This 2000 report considered and made recommendations on the intelligence communities, stopping support for international terrorism, and preparing to deal with mass catastrophic terrorism.

National Common Operating Picture: "Common operating pictures, also known as common operational pictures, are computer displays created to provide multiple users with a real-time view, also called situational awareness, of a series of events, such as rescue activities following an attack or natural disaster. DHS' national common operating picture uses National Geospatial-Intelligence Agency mapping capabilities and is incorporating dynamic, real-time data…. The Homeland Security Department earlier this year [2006] activated its Common Operating Picture for the National Operations Center. The agency rushed creation of it immediately after Hurricane Katrina to create situational awareness. Over the following months, those efforts became the national system…. A source of data for the DHS national common operating picture is the National Geospatial-Intelligence Agency and its Palanterra application, a map-based common operating picture. It includes overlays for critical infrastructure, including transportation, medical centers, water plants, power facilities and some financial and IT infrastructure…" (**Lipowicz**, "Fine Tuning Needed," Washington Technology, October 16, 2006; see also, **White House**, National Strategy for Information Sharing, October 2007, p. 21))

National Communication System No. 1: "A nationwide FCDA communication system, set up to minimize communication disruptions following an attack, was placed in operation in 1955. The system, known as the FCDA National Communication System No. 1, utilizes voince-teletypewriter circuits, and is engineered to use regular commercial voice telephone circuits, by-passing the regular teletype communication centers located in critical target areas. The network connects FCDA National Headquarters with its seven regional offices, alternate National Headquarters, each State civil defense headquarters, and District of Columbia civil defense headquarters, and has provision for control from FCDA Region 5, Denton, Tex., should the FCDA National Headquarters become inoperative." (**FCDA**, *1955 Annual Plan*, 1956, p. 97)

National Communications System (NCS): "A system governed by Executive Order 12472 and comprised of the telecommunications assets of the 24 Departments and Agencies. DHS serves as the Executive Agent for the NCS which is responsible for assisting the President, the National Security Council, the Director of OSTP, and the Director of OMB in (1) the exercise of

telecommunications functions and their associated responsibilities and (2) the coordination of planning for providing the Federal Government, under all circumstances (including crises and emergencies, attacks, and recovery and reconstitution from those events), with the requisite national-security and emergency-preparedness communications resources." (**DHS**, *FCD 1*, Nov 2007, P-7)

National Communications System: "President Kennedy established the National Communications System by a Presidential Memorandum on August 21, 1963. The NCS mandate included linking, improving, and extending the communications facilities and components of various Federal agencies, focusing on interconnectivity and survivability…. After nearly 40 years with the Secretary of Defense serving as its Executive Agent, President George W. Bush transferred the National Communications System to the Department of Homeland Security (DHS). The NCS was one of 22 Federal agencies transferred to the Department on March 1, 2003, in accordance with Executive Order 13286. A revised Executive Order 12472 reflects the changes of E.O. 13286. On November 15, 2005, the NCS became part of the Department's Directorate for Preparedness after nearly two years under the Information Analysis and Infrastructure Protection Directorate. Currently, the DHS Under Secretary for National Protection and Programs serves as the NCS Manager." (**NCS,** "About the NCS")

National Contingency Plan (National Oil and Hazardous Substances Pollution Contingency Plan): "…the federal government's blueprint for responding to both oil spills and hazardous substance releases. The National Contingency Plan is the result of our country's efforts to develop a national response capability and promote overall coordination among the hierarchy of responders and contingency plans.

"The first National Contingency Plan was developed and published in 1968 in response to a massive oil spill from the oil tanker *Torrey Canyon* off the coast of England the year before. More than 37 million gallons of crude oil spilled into the water, causing massive environmental damage. To avoid the problems faced by response officials involved in this incident, U.S. officials developed a coordinated approach to cope with potential spills in U.S. waters. The 1968 plan provided the first comprehensive system of accident reporting, spill containment, and cleanup, and established a response headquarters, a national reaction team, and regional reaction teams (precursors to the current National Response Team and Regional Response Teams).

"Congress has broadened the scope of the National Contingency Plan over the years. As required by the Clean Water Act of 1972, the NCP was revised the following year to include a framework for responding to hazardous substance spills as well as oil discharges. Following the passage of Superfund legislation in 1980, the NCP was broadened to cover releases at hazardous waste sites requiring emergency removal actions. Over the years, additional revisions have been made to the NCP to keep pace with the enactment of legislation. The latest revisions to the NCP were finalized in 1994 to reflect the oil spill provisions of the Oil Pollution Act of 1990." (EPA, National Contingency Plan Overview, March 9, 2006 Update)

National Contingency Plan (National Oil and Hazardous Substances Pollution Contingency Plan): "Policies and procedures of the federal agency members of the National Oil and Hazardous Materials Response Team. This document provides guidance for responses, remedial action, enforcement, and funding mechanisms for hazardous materials incident responses." (**NFPA 471**, 1997, p.8)

National Continuity Coordinator (NCC): "The President shall lead the activities of the Federal Government for ensuring constitutional government. In order to advise and assist the President in that function, the Assistant to the President for Homeland Security and Counterterrorism (APHS/CT) is hereby designated as the National Continuity Coordinator. The National Continuity Coordinator, in coordination with the Assistant to the President for National Security Affairs (APNSA), without exercising directive authority, shall coordinate the development and implementation of continuity policy for executive departments and agencies. The Continuity Policy Coordination Committee (CPCC), chaired by a Senior Director from the Homeland Security Council staff, designated by the National Continuity Coordinator, shall be the main day-to-day forum for such policy coordination." (**White House,** *HSPD-20*, May 2007)

National Continuity Four Pillars:

- Leadership
- Staff
- Facilities
- Communications (**FEMA**, *MEF/PFEF Workshop*, Unit 5, 2008, slide 119)

National Continuity Goal: "The ultimate goal of continuity in the Executive Branch is the continuation of the eight NEFs [see NEFs] which are the critical responsibilities of the Federal Government needed to lead and sustain the Nation." (**FEMA**, *MEF) and PMEF* Workshop, 5Feb08, slide 20)

National Continuity Implementation Plan: The NCIP includes "prioritized goals and objectives, a concept of operations, performance metrics by which to measure continuity readiness, procedures for continuity and incident management activities, and clear direction to executive department and agency continuity coordinators, as well as guidance to promote interoperability of Federal Government continuity programs and procedures with State, local, territorial, and tribal governments, and private sector owners and operators of critical infrastructure, as appropriate." (**White House,** *HSPD-20*, May 9, 2007)

National Continuity Policy: "Establishes a comprehensive national course of action for the continuity of Federal Government structures and operations." (**DHS**, *FCD 1*, Nov 2007, P-7)

National Continuity Policy: "It is the policy of the United States to maintain a comprehensive and effective continuity capability composed of Continuity of Operations and Continuity of Government programs in order to ensure the preservation of our form of government under the Constitution and the continuing performance of National Essential Functions under all conditions. For continuity purposes, each executive department and agency is assigned to a category in accordance with the nature and characteristics of its national security roles and responsibilities in support of the Federal Government's ability to sustain the NEFs. The Secretary of Homeland Security shall serve as the President's lead agent for coordinating overall continuity operations and activities of executive departments and agencies…" (**White House,** *HSPD-20***,** May 9, 2007)

National Continuity Policy Implementation Plan: Approved by President Bush in August 2007 "to build upon the *Policy* [NSPD-51/HSPD-20] and provide guidance to executive departments and agencies on appropriately identifying and carrying out their Primary Mission Essential Functions that support the eight National Essential Functions—the most critical functions necessary to lead and sustain the Nation during a catastrophic emergency." (**DHS**, *Federal Continuity Directive 1*, November 2007, p. ii) [The NCPIP is Dated 27Sep07]

National Continuity Policy Implementation Plan – Transformation of Continuity:

- The old organizational framework has changed
- Pursuant to NSPD-51/HSPD-20, and with…[the] *National Continuity Policy Implementation Plan*, the President directs the Executive Branch to reorient itself and to utilize an *integrated, overlapping national continuity concept* in order to ensure the preservation of our government and the continuing performance of essential functions. (**FEMA**, *MEF/PMEF Workshop: Unit 2, MEF/PMEF Process*, 2008, slide 27)
- Continuity responsibility and planning is no longer a separate, compartmented function of an independent cell of a few planners in each government D/A. (Ibid, slide 28)

National Continuity Risk Management Options:

- Policy development
- Business process reengineering
- Asset dispersion
- Continuity systems design redundancy (**FEMA**, *MEF/PMEF Workshop*, 2008, slide 132)

National Council on Disability (NCD): "NCD is an independent federal agency and is composed of 15 members appointed by the President, by and with the advice and consent of the Senate. NCD provides advice to the President, Congress, and executive branch agencies to promote policies, programs, practices, and procedures that guarantee equal opportunity for all individuals with disabilities, regardless of the nature or severity of the disability; and empower individuals with disabilities to achieve economic self-sufficiency, independent living, and inclusion and integration into all aspects of society." (National Council on Disability. *Quarterly Meeting: People with Disabilities and Emergency Management,* Jan 29, 2008, p. 2)

National Counterproliferation Center (NCPC): "On December 21, 2005 the Director of National Intelligence (DNI) announced the formal establishment of the DNI National Counterproliferation Center (NCPC). The NCPC will coordinate strategic planning within the Intelligence Community (IC) to enhance intelligence support to United States efforts to stem the proliferation of weapons of mass destruction and related delivery systems. It will work with the IC to identify critical intelligence gaps or shortfalls in collection, exploitation, or analysis, and develop solutions to ameliorate or close these gaps. It will also work with the IC to identify long-term proliferation threats and requirements and develop strategies to ensure the IC is positioned to address these threats and issues. NCPC will reach out to elements both inside the Intelligence Community and outside the IC and the U.S. Government to identify new methods or technologies that can enhance the capabilities of the IC to detect and defeat future proliferation threats….The Intelligence Reform and Terrorism Prevention Act of 2004 provided for the establishment of the NCPC to enhance coordination, planning and information sharing amongst the IC on proliferation issues. The Commission on the Intelligence Capabilities of the United

States Regarding Weapons of Mass Destruction's Report of March 31, 2005 also recommended the establishment of an NCPC. The President accepted the Commission's recommendation on June 30, 2005." (**Office of the Director of National Intelligence**, *NCPC*, 2005)

National Counterterrorism Center (NCTC): "It is a primary mission of NCTC to conduct planning for counterterrorism activities, integrating all instruments of national power, including diplomatic, financial, military, intelligence, homeland security, and law enforcement activities within and among agencies. NCTC also assigns roles and responsibilities as part of its planning duties to lead departments or agencies, as appropriate, for counterterrorism activities that are consistent with applicable law and that support counterterrorism strategic operational plans, but shall not direct the execution of any resulting operations.[86] (**FEMA**, *Interim IPS* (Draft 2.3), July 3, 2008 copy, pp. 3-1 – 3-2)

National Counterterrorism Center (NCTC): "In August 2004, the President established the National Counterterrorism Center (NCTC) to serve as the primary organization in the United States Government (USG) for integrating and analyzing all intelligence pertaining to terrorism and counterterrorism (CT) and to conduct strategic operational planning by integrating all instruments of national power. In December 2004, Congress codified the NCTC in the Intelligence Reform and Terrorism Prevention Act (IRTPA) and placed the NCTC in the Office of the Director of National Intelligence… NCTC is a multi-agency organization dedicated to eliminating the terrorist threat to US interests at home and abroad." (**NCTC**, *About NCTC*, 2007)

National Cyber Response Coordination Group (NCRCG), DHS: "Made up of 13 Federal agencies, this is the principal Federal agency mechanism for cyber incident response. In the event of a nationally significant cyber-related incident, the NCRCG will help to coordinate the Federal response, including US-CERT, law enforcement, and the intelligence community." (**DHS**, *National Cyber Security Division*, September 23, 2006 update)

National Cyber Security Awareness Month, DHS: "Every October the National Cyber Security Division coordinates with multiple states, universities and the private sector to produce National Cyber Security Awareness month." (**DHS**, *NCS Division*, September 23, 2006 update)

National Cyberspace Response System: "The National Cyber Security Division seeks to protect the critical cyber infrastructure 24 hours a day, 7 days a week. The National Cyberspace Response System coordinates the cyber leadership, processes, and protocols that will determine when and what action(s) need to be taken as cyber incidents arise." (**DHS**, *National Cyber Security Division*, September 23, 2006 update)

National Dam Safety Program (NDSP): "As the lead federal agency for the National Dam Safety Program, FEMA is responsible for coordinating efforts to secure the safety of dams throughout the United States. The program makes federal funds available to states, which are primarily responsible for protecting the public from dam failures of non-federal dams, and pursuing initiatives that enhance the safety and security of dams posing the greatest risk to people and property. Congress' passage of the Dam Safety Act of 2006 strengthened and reauthorized the program through FY 2011." (**DHS**, *FEMA OMA FY 2009*, 2008, 28; **FEMA**,

[86] Intelligence Reform and Terrorism Prevention Act of 2004, Section 1021.

About the National Dam Safety Program, 2007)

National Defense Executive Reserve (NDER): Created by *Executive Order 10660: Providing for the Establishment of a National Defense Executive Reserve*. (**White House**, 15 Feb1956)

"NDER is a Government-wide program which recruits business executives and other civilians to serve the Government in key executive positions during national emergencies. According to FEMA, NDER is important to Federal emergency preparedness because of the tremendous increase in Government regulation and direction of the economy and vital resources that would accompany a war emergency. This would create the need to augment the staffs of Federal agencies having emergency functions. FEMA administers and evaluates the NDER program. GAO reports issued in 1978 and 1982 noted that this program had not been very effective" (**GAO**, *NDER Program*, Feb 1983, 3)

National Defense Strategy (NDS): "The NDS supports the NSS [National Security Strategy] by establishing a set of overarching defense objectives that guide the Department's security activities and provide direction for the National Military Strategy. The NDS objectives serve as links between military activities and those of other government agencies in pursuit of national goals. The Department must take action to secure the United States from direct attack and counter, at a safe distance, those who seek to harm the country." (**DOD/JCS**, *NMS*, 2004, 1)

National Disaster Housing Strategy (NDHS): "One of the greatest challenges presented by the scope and scale of catastrophic disasters is the ability to house displaced evacuees…. To further enhance housing capabilities, FEMA has engaged Federal, Tribal, State, and local partners to develop a National Disaster Housing Strategy (NDHS). The purpose of the NDHS is to convey national guidance, operating principles, and a vision for public (Federal, State, tribal, local), private, and non-profit cooperation in providing disaster housing assistance. It defines the roles, programs, authorities, and responsibilities of all entities, detailing shared responsibilities and emphasizing the cooperative efforts required to provide disaster housing assistance. The NDHS further outlines the most efficient and cost-effective options for meeting disaster housing needs. The NDHS is in the final development stages." (**FEMA**, *Statement of Glenn Cannon*, December 4, 2007, pp. 7-8)

National Disaster Medical System (NDMS), HHS: A federally coordinated initiative to augment the nation's emergency medical response capability by providing medical assets to be used during major disasters or emergencies. NDMS has three major components: Disaster Medical Assistance Teams and Clearing-Staging Units to provide triage, patient stabilization, and austere medical services at a disaster site; an evacuation capability for movement of patients from a disaster area to locations where definitive medical care can be provided; and a voluntary hospital network to provide definitive medical care. NDMS is administered by the Department of Health and Human Services/U.S. Public Health Service, in cooperation with the Department of Defense, the Department of Veterans Affairs, FEMA, State and local governments, and the private sector. (**Facts on the NDMS**)

National Disaster Medical System (NDMS), HHS: "NDMS is a coordinated effort among the HHS, DoD, VA, and DHS. NDMS is comprised of full time Federal employees, as well as

intermittent Federal employees drawn from the private sector and organized into a variety of emergency medical disaster response teams who provide health services to the needs of victims of public health emergencies. NDMS, in coordination with the DoD and the VA, also provides patient evacuation to designated locations throughout the United States for casualties that cannot be cared for locally. The NDMS staff continuously evaluate the effectiveness of its systems and programs, based on customer feedback, to improve services and operations, while reducing administrative expenses." (**HHS**, Job Announcement HHS-OS-2008-0169, Program Specialist (Watch Officer), 27 Dec 2007, pp. 2-3)

National Disaster Medical System (NDMS), HHS: "The National Disaster Medical System (NDMS) is a federally coordinated system that augments the Nation's medical response capability. The overall purpose of the NDMS is to establish a single integrated National medical response capability for assisting State and local authorities in dealing with the medical impacts of major peacetime disasters and to provide support to the military and the Department of Veterans Affairs medical systems in caring for casualties evacuated back to the U.S. from overseas armed conventional conflicts." (**HHS**, *National Disaster Medical System*, July 17, 2007 update)

National Disaster Recovery Strategy (Subtitle E – Stafford Act Amendments, PKEARA):
"The National Disaster Recovery Strategy shall –
(1) outline the most efficient and cost-effective Federal programs that will meet the recovery needs of States, local and tribal governments, and individuals and households affected by a major disaster;
(2) clearly define the role, programs, authorities, and responsibilities of each Federal agency that may be of assistance in providing assistance in the recovery from a major disaster;
(3) promote the use of the most appropriate and cost-effective building materials (based on the hazards present in an area) in any area affected by a major disaster, with the goal of encouraging the construction of disaster-resistant buildings; and
(4) describe in detail the programs that may be offered by the agencies described in paragraph (2), including – (A) discussing funding issues; (B) detailing how responsibilities under the National Disaster Recovery Strategy will be shared; and (C) addressing other matters concerning the cooperative effort to provide recovery assistance." (**Stafford Act** (FEMA 592), 2007, p. 77)

National Domestic Preparedness Consortium (NDPC): "ODP's [Office of Domestic Preparedness] major training partner is the National Domestic Preparedness Consortium (NDPC), through which ODP identifies, develops, tests, and delivers training to state and local emergency responders. The NDPC includes:

• *ODP's Center for Domestic Preparedness (CDP):* CDP is ODP's all-hazards training facility. It provides advanced, hands-on training to members of the emergency response community in the areas of command, advanced hazmat, and tactical operations. CDP is the only WMD training facility that provides hands-on training to civilian emergency responders in a toxic chemical agent environment.

• *New Mexico Institute of Mining and Technology (NMIMT):* NMIMT, a world leader in explosives research, serves as the lead NDPC partner for explosives, firearms, and incendiary devices training. New Mexico Tech also delivers a program on suicide bombing prevention.

• *Louisiana State University (LSU):* LSU provides training and expertise in the areas of law enforcement, bioterrorism, agricultural terrorism, weapons of mass destruction, and mass casualty incidents.

• *Texas A&M University System, Texas Engineering Extension Service (TEEX):* TEEX develops and conducts national WMD preparedness training for all emergency response disciplines, as well as courses in incident management/unified command, threat and risk assessments, operations for public works, and WMD operations for emergency medical services. TEEX also conducts a structural collapse technician course to build state capabilities for urban search and rescue operations.

• *Department of Energy's Nevada Test Site (NTS):* NTS conducts radiological and nuclear training at NTS and via mobile training teams. It also develops and delivers radiological/nuclear mobile training at the awareness and operations levels and conducts train-the-trainer courses for first responders across the country." (**DHS**, *Office of State and Local Government Coordination and Preparedness*, 25 July 2005, p. 3)

National Domestic Preparedness Consortium (NDPC): "The National Domestic Preparedness Consortium (NDPC) is the principal vehicle through which G&T [DHS] identifies, develop, tests, and delivers training to state and local emergency responders. The NDPC membership includes G&T's Center for Domestic Preparedness (CDP) in Anniston, Alabama, the New Mexico Institute of Mining and Technology (NMIMT), Louisiana State University (LSU), Texas A&M University (TEEX), and the Department of Energy's Nevada Test Site (NTS); each member brings a unique set of assets to the domestic preparedness program." (**DHS**, *The National Domestic Preparedness Consortium (NDPC).* April 3, 2007 update)

National Domestic Preparedness Consortium (NDPC): "NDPC partners provide training for State and local responders that is focused on preparing for and responding to weapons of mass destruction and terrorism." (**FEMA**, *90 Day Update to Congress on National Preparedness* (Dennis R. Schrader, Deputy Administrator for National Preparedness), April 2008, slide 63)

National Domestic Preparedness Consortium (NDPC): "The NDPC consists of the National Center for Biomedical Research and Training – Academy of Counter-Terrorist Education (NCBRT-ACE) at Louisiana State University (LSU), The Energetic Materials Research and Testing Center (EMRTC) at New Mexico Institute of Mining and Technology (NMIMT), U.S. Department of Energy's Counter Terrorism Operations Support (CTOS) at Nevada Test Site (NTS), and the National Emergency Response and Rescue Training Center (NERRTC) at Texas Engineering Extension Service (TEEX). Each member of the Consortium specializes in a subject area that addresses one of the following: chemical, biological, radiological, nuclear, and explosives. New Mexico Tech, for instance, focuses its training on explosive devices. At present, the NDPC forms the core of TEI/TO's training program. Its members are responsible for training the bulk of the responders who go through TEI/TO's program." (**FEMA**, *Training and Exercise Integration Secretariat Training Operations Course Catalog*, March 21, 2008, p. 4)

National Donations Management Network: "There is a new, easy way to provide financial support, donate time and skills or donate needed products. The National Donations Management Network is a web-based system where individuals and the private sector can offer their support online to the voluntary organizations that are actively engaged in the ongoing disaster.

FEMA works in partnership with the National Voluntary Organizations Active in Disaster (NVOAD), the Aidmatrix Foundation and private sector partners to direct donation offers to voluntary agencies in need as they support the thousands of displaced victims. FEMA and Aidmatrix entered into a cooperative agreement, in 2006, to develop this donations management network. The Aidmatrix Foundation offers a way to connect private sector or individuals wanting to offer support on-line to the leading organizations in humanitarian relief.

The National Donations Management Network is located at www.fema.gov/donations. Visitors to this site have the option to direct their donation to national level voluntary agencies or directly to the affected Midwest; states such as Iowa, Indiana, Minnesota and Missouri are managing their own state portals." (**FEMA**, *Donations for Flood Victims Made Easy*, June 20, 2008)

National Earthquake Hazard Reduction Program (NEHRP): The four goals of NEHRP are:

- Develop effective practices and policies for earthquake loss-reduction and accelerate their implementation.
- Improve techniques to reduce seismic vulnerability of facilities and systems.
- Improve seismic hazards identification and risk-assessment methods and their use.
- Improve the understanding of earthquakes and their effects. (**FEMA**, *About the National Earthquake Hazards Reduction Program*, January 16, 2008 mod.)

National Earthquake Hazard Reduction Program (NEHRP): "The National Earthquake Hazards Reduction Program (NEHRP), which is authorized by the Earthquake Hazards Reduction Act of 1977 (Public Law 95-124), as amended, seeks to mitigate earthquake losses in the United States through both basic and directed research and implementation activities in the fields of earthquake science and engineering. For 30 years, NEHRP has reduced the vulnerability of the people and property of the United States through the following:
• Improvement in the understanding of the processes that generate earthquakes.
• Improvement in the understanding of the effects of earthquakes in terms of ground shaking and ground failure, building shaking and damage, and on the general infrastructure and economic fabric of the United States.
• Development of earthquake hazards and risk assessments and earthquake resistant building codes and practices.
• Implementation of earthquake risk reduction measures through the adoption of building codes, land use practices, and earthquake response exercises at all levels of government and in the private sectors." (**NEHRP** *Annual Report of the National Earthquake Hazards Reduction Program*, March 2007, from Preface)

National Earthquake Hazards Reduction Program (NEHRP) Goals and Objectives:
Goal A: Improve understanding of earthquake processes and impacts.
Objective 1: Advance understanding of earthquake phenomena and generation processes.
Objective 2: Advance understanding of earthquake effects on the built environment.

Objective 3: Advance understanding of social, psychological, economic factors linked to implementing risk reduction and mitigation strategies in the public and private sectors.
Objective 4: Improve post-earthquake information management.

Goal B: Develop cost-effective measures to reduce earthquake impacts on individuals, the built environment, and society-at-large.

Objective 5: Assess earthquake hazards for research and practical application.
Objective 6: Develop advanced loss estimation and risk assessment tools.
Objective 7: Develop tools to improve the seismic performance of buildings and other structures.
Objective 8: Develop tools to improve the seismic performance of critical infrastructure.

Goal C: Improve the earthquake resilience of communities nationwide.

Objective 9: Improve accuracy, timeliness, content of earthquake information products.
Objective 10: Develop comprehensive earthquake risk scenarios and risk assessments.
Objective 11: Support development of seismic standards and building codes and advocate their adoption and enforcement.
Objective 12: Promote implementation of earthquake-resilient measures in professional practice and in private and public policies.
Objective 13: Increase public awareness of earthquake hazards and risks.
Objective 14: Develop the nation's human resource base in earthquake safety fields.
(**NEHRP**, *Strategic Plan for the NEHRP Fiscal Years 2008-2012*, April 2008 Draft, p. v)

National Earthquake Hazards Reduction Program (NEHRP) Interagency Coordinating Committee (ICC): "The NEHRP ICC is composed of the directors of the four NEHRP agencies, the Federal Emergency Management Agency (FEMA), the National Institute of Standards and Technology (NIST), the National Science Foundation (NSF), and the U.S. Geological Survey (USGS), as well as the directors of the White House Office of Science and Technology Policy (OSTP) and Office of Management and Budget (OMB). The ICC is chaired by the Director of NIST." (**NEHRP** *Annual Report of the NEHRP*, March 2007, p. vii)

National Earthquake Hazards Reduction Program (NEHRP) Mission: "To develop, disseminate, and promote knowledge, tools, and practices for earthquake risk reduction – through coordinated, multi disciplinary interagency partnerships among the NEHRP agencies and their stakeholders – that improve the nation's earthquake-resilience in public safety, economic strength, and national security." (**NEHRP**, *Strategic Plan for the NEHRP Fiscal Years 2008-2012*, April 2008 Draft, p. v)

National Earthquake Hazards Reduction Program (NEHRP) National Investment Factors: "The national investment in NEHRP through these agencies [NIST, FEMA, NSF, USGS] recognizes at least four important factors related to the costs of preparing for large-scale disasters.

- First and foremost, ensuring public safety is inherently a government responsibility.
- Second, absent appropriate incentives, private interests and corporations invest in preparedness and mitigation measures that they believe protects their economic well-being, not necessarily those that yield greatest societal well-being.
- Third, earthquake impacts and consequences can be felt at regional and national scales; they are not just restricted to a local area of most severe shaking. As a result, post-

> earthquake performance is based on all infrastructure elements acting as a system, not simply as an aggregation of individual components. In today's economy, damaging earthquakes that strike in some areas of the country will severely impact the national economy and, possibly, national security.

Finally, there are few, if any, construction-related businesses that are large enough to possess the investment resources needed to address major national earthquake safety challenges." (**NEHRP**, *Strategic Plan for the NEHRP Fiscal Years 2008-2012*, April 2008 Draft, p. 4)

National Earthquake Hazards Reduction Program (NEHRP), National Science Foundation Role: "NSF supports a broad range of basic research in geosciences; engineering; and social, behavioral, and economic sciences relevant to the understanding of the causes and impacts of earthquakes. NSF supports research into the causes and dynamics of earthquakes, plate tectonics, and crustal deformation as well as research on the seismic performance of geotechnical, structural, nonstructural, and infrastructure lifeline systems. NSF also supports research on such social, behavioral, and economic phenomena as risk perception, mitigation decision-making, incentive systems related to risk and mitigation, and factors that can promote community resilience. NSF supports advanced earthquake engineering research experimental facilities and cyberinfrastructure. NSF provides support for the education of new scientists and engineers, the integration of research and education, and outreach to professionals and the public." (**NEHRP**, *Strategic Plan for the NEHRP Fiscal Years 2008-2012*, April 2008 Draft, p. 4)

National Earthquake Hazards Reduction Program (NEHRP) Strategic Priorities: "The Plan adds nine new cross-cutting Strategic Priorities that directly support the goals and augment other ongoing agency activities needed to satisfy them…. The priorities are:

- Fully implement the Advanced National Seismic System.
- Improve techniques for evaluating and rehabilitating existing buildings.
- Further develop Performance-Based 1 Seismic Design.
- Increase consideration of socio-economic issues related to hazard mitigation implementation.
- Develop a national post-earthquake information management system.
- Develop advanced earthquake risk mitigation technologies and practices.
- Develop earthquake-resilient lifeline components and systems.
- Develop and conduct earthquake scenarios for effective earthquake risk reduction.
- Facilitate improved earthquake mitigation at state and local levels. (**NEHRP**, *Strategic Plan for the NEHRP Fiscal Years 2008-2012*, April 2008 Draft, pp. vi-vii)

National Earthquake Hazards Reduction Program (NEHRP) USGS Role: "USGS conducts and supports targeted geoscience research investigations on earthquake causes and effects, produces national and regional seismic hazard maps and assessments, monitors and rapidly reports on earthquakes and their shaking intensities in the U.S. and abroad, works to improve public understanding of earthquake hazards, and coordinates post-earthquake reconnaissance carried out and supported by NEHRP agencies and other organizations." (**NEHRP**, *Strategic Plan for the NEHRP Fiscal Years 2008-2012*, April 2008 Draft, p. 4i)

National Earthquake Hazards Reduction Program (NEHRP) Vision: "A nation that is earthquake-resilient in public safety, economic strength, and national security." (**NEHRP**, *Strategic Plan for the NEHRP Fiscal Years 2008-2012*, April 2008 Draft, p. v)

National Electronic Disease Surveillance System (NEDSS): "…NEDSS is an initiative that promotes the use of data and information system standards to advance the development of efficient, integrated, and interoperable surveillance systems at federal, state and local levels. It is a major component of the Public Health Information Network (PHIN)…. The vision of NEDSS is to have integrated surveillance systems that can transfer appropriate public health, laboratory, and clinical data efficiently and securely over the Internet. NEDSS will revolutionize public health by gathering and analyzing information quickly and accurately. This will help to improve the nation's ability to identify and track emerging infectious diseases and potential bioterrorism attacks as well as to investigate outbreaks and monitor disease trends." (**CDC**, *NEDSS*)

National Emergencies Act of 1976: "The **National Emergencies Act of 1976**, 50 U.S.C. 1601 *et seq*, establishes procedures for Presidential declaration and termination of national emergencies. The Act requires the President to identify the specific provision of law under which he will act in dealing with a declared national emergency and contains a sunset provision requiring the President to renew a declaration of national emergency to prevent its automatic expiration. The Presidential declaration of a national emergency under the Act is a prerequisite to exercising any special or extraordinary powers authorized by statute for use in the event of national emergency." (**DHS**, *National Response Plan* (Draft #1), February 25, 2004, p. 69)

National Emergency: "A condition declared by the President or the Congress by virtue of powers previously vested in them that authorize certain emergency actions to be undertaken in the national interest. Action to be taken may include partial, full, or total mobilization of national resources." (**DoD**, *DOD Dictionary of Military and Related Terms*, 2007)

National Emergency: "A condition, declared by the President pursuant to 50 U.S.C. 1601 et seq. or by the Congress, which authorizes certain emergency actions to be undertaken in the national interest. Actions to be taken may include partial or full mobilization of national resources." (**USACE**, *Planning and Operations Guidelines, Annex V: Definitions and Common* Terms, 1985, p. V-3)

National Emergency Alarm Repeater (NEAR) System (1960): Outdoor warning systems are generally inadequate for persons inside buildings. The National Emergency Alarm Repeater INEAR) system has been developed for indoor warnings. Nationwide coverage by the system will require an expenditure of $40 to $60 million for generating equipment. In addition, plug-in alarms will need to be purchased for homes and offives to make this system operative. Two thousand NEAR receivers have been purchased for demonstrating the system at Charlotte, Michingan, during FY 1961. Experience from this operation *will be used to develop policies for nationwide use of the NEAR system." (**OCDM**, Annual Report 1960*, p. 18)

National Emergency Communications Plan (NECP).

National Emergency Communications Strategy (NECS).

National Emergency Family Registry Locator System/National Emergency Child Locator Center: "In a large-scale evacuation, families may become unwillingly separated due to urgency of the evacuation, loss of communication systems, and/or the method and type of evacuation assistance made available. To assist displaced disaster victims reconnect with family members and locate missing children, FEMA has established the National Emergency Family Registry Locator System and the National Emergency Child Locator Center. Families and friends will be able to call an 800 number or go to the internet to send or receive messages for selected friends or family members including those in medical facilities. The National Center for Missing and Exploited Children and FEMA have partnered to facilitate the search and the reunification of missing children due to a disaster or evacuation. A Memorandum of Understanding was signed in 2006 by FEMA, the Department of Justice, the National Center for Missing and Exploited Children, and the American Red Cross to further develop and implement methods for quickly identifying and reunifying missing and separated children and family members following a disaster." (**FEMA**, *Statement of Glenn Cannon*, December 4, 2007, p. 7; see, also, **FEMA**, *National Emergency Family Registry System and Child Locator Center Activated For California Fires*, October 23, 2007)

National Emergency Management Information System (NEMIS): "NEMIS is an integrated system to provide FEMA, the states, and certain other federal agencies with automation to perform disaster related operations. NEMIS supports all phases of emergency management, and provides financial related data to IFMIS via an automated interface." (**OIG/DHS**, *IT Management Letter for FY 2005 DHS Financial Statement Audit (Redacted)*, July 2006, p. 12)

National Emergency Management Association: "NEMA is the professional association of and for state* emergency management directors. NEMA's mission is to:

* Provide national leadership and expertise in comprehensive emergency management.

* Serve as a vital emergency management information and assistance resource.

* Advance continuous improvement in emergency management through strategic partnerships, innovative programs, and collaborative policy positions. (**NEMA**, *Welcome to NEMA*, 2007)

National Emergency Management Baseline Capability Assessment Program (NEMB-CAP), FEMA:

"NEMB-CAP is an ongoing effort sponsored by the Federal Emergency Management Agency (FEMA) that is analyzing existing emergency management programs planning efforts at the State level using the EMAP Standard. To date, 40 States have completed the NEMB-CAP process. Of the 40 States, only two met all criteria for planning, only five were compliant with most or all standards, and only two states were fully compliant in all 14 functional areas. The process has highlighted the importance of ensuring that roles and responsibilities are not only well understood, but also operationalized at the State and local level; additionally, findings from this process have revealed critical national weaknesses in key operational areas and catastrophic planning efforts, including:

• Incident management
• Planning, including continuity of operations and recovery strategies
• Hazard identification, risk assessment, and impact analysis
• Resource management, including identification of resource objectives, by hazard, predisaster." (**DHS/ODP**, *FY 2006 EMPG Program Guidance*, November 2005, p. 7)

National Emergency Management Baseline Capability Assessment Program (NEMB-CAP):

"The NEMB-CAP involves a multi-year effort to assess, analyze, evaluate, and collectively frame state emergency management capabilities against a common national set of criteria. Actual assessments of state and state-level jurisdictions began in January 2003, and are projected to be complete by the end of 2005. Participation is voluntary, but FEMA strongly encourages all states to take part in the program, which will play a key role in our national emergency management improvement strategy.

The NEMB-CAP consists of a review and evaluation of state emergency management systems and programs based on assessment criteria developed by, and employing the assessment processes of the Emergency Management Accreditation Program (EMAP). The EMAP was established through a collaborative partnership involving FEMA, the National Emergency Management Association (NEMA), the International Association of Emergency Managers (IAEM), and other stakeholder organizations, including the National Governors Association, National League of Cities and The Council of State Governments.

The assessment methodology involves the state completing a comprehensive self-assessment, followed up by an on-site, week-long assessment by a team of trained, independent peer assessors. FEMA analyzes assessment reports to identify individual and collective capability strengths and weaknesses. This assessment serves two purposes – one of establishing a national capability baseline and also helping target future federal assistance to areas of greatest common need." (**FEMA**, "Homeland Security And FEMA Achieve Emergency Management Assessment Milestone," April 14, 2004)

National Emergency Preparedness Program (NEPP): "Manages preparedness for nuclear mishaps, catastrophic disasters, support to military supporting disasters, terrorism, immigration, emergencies, and civil disturbances." (**USACE**, *NEPP*)

National Emergency Resource Registry (NEER): "Through NEER, DHS assists the coordination efforts between the resources that are needed and the resources that may be available from the private and public sectors." (**FedCenter.gov**, *The NEER*, Sep 19, 2005)

Developed by the DHS Private Sector Office.

National Emergency Responder Credentialing System: "The National Emergency Responder Credentialing System is currently under development by the Federal Emergency Management Agency's NIMS Integration Center. As a means to routinely identify and dispatch emergency

responders, the National Emergency Responder Credentialing System will help mobilize the swift, safe and successful support of qualified responders who are called upon to assist communities across the nation. Ultimately, credentials verifying an emergency responder's identity and qualifications may be documented through a nationally accepted form of identification and/or through a record-keeping system, as required by NIMS." (**FEMA**, *National Emergency Responder Credentialing System* (Fact Sheet), October 26, 2005, p. 1)

National Emergency Responder Credentialing System Metrics:

- Education: Formal instruction based upon a curriculum that prepares an individual with the core knowledge and skill for entry into a discipline and for performing a job title
- Training: Instruction and/or activities that enhance and individual's core knowledge; increase skill set and proficiency; and strengthen and augment abilities.
- Experience: Time required functioning in a job title for an individual to attain proficiency in applying knowledge, skills, and abilities
- Physical/Medical Fitness: Physical and medical considerations that, when applied, help to ensure safe performance in risky environments
- Certification: Designation granted by Authority Having Jurisdiction[3] that an individual has met the requirements and achieved specific knowledge, skills, and abilities.
- Licensing: Legal designation granted by Authority Having Jurisdiction, indicating that a person has met the necessary legal requirements to function in a job title. (**FEMA**, *Animal Emergency Response Positions Credentials*, 25 Oct 2007, p. 1)

National Emergency Responder Credentialing System Public Works Job Titles:

- PW Job Title 1: Assistant Public Works Director – Logistics
- PW Job Title 2: Assistant Public Works Director – Operations
- PW Job Title 3: Civil/Field Engineer
- PW Job Title 4: Debris Collection Supervisor
- PW Job Title 5: Debris Removal Manager
- PW Job Title 6: Debris Site Manager
- PW Job Title 7: Engineering Branch Manager
- PW Job Title 8: Engineering Division Manager
- PW Job Title 9: Equipment Operator
- PW Job Title 10: Public Works Director
- PW Job Title 11: Quality Assurance Personnel
- PW Job Title 12: Structural Engineer
- PW Job Title 13: Utility Systems Reconstruction Manager
- PW Job Title 14: Wastewater Collection Manager
- PW Job Title 15: Wastewater System Manager
- PW Job Title 16: Wastewater Treatment Manager
- PW Job Title 17: Water Distribution Manager
- PW Job Title 18: Water System Manager
- PW Job Title 19: Water Treatment Manager (**FEMA**, *Designing a National Emergency Responder Credentialing System – Public Works (PW) Working Group*. 22 Nov 2006, 1)

National Emergency Response and Rescue Training Center (NERRTC), Texas Engineering Extension Service (TEEX): "NERRTC prepares state and local officials for the management challenge posed by WMD through hands-on, scenario-driven training and computer-based simulations. The Emergency Operations Training Center uses state-of-the-art simulation and computer-based technologies to train first responders and city officials to manage a crisis through a unified command approach with realistic, real-time simulation and training analysis at a command-post level not provided by any other organization." (**FEMA**, *TEI/TO*, 2008, 5)

National Emergency Response Team (ERT-N): "The ERT-N responds in the early stages of a catastrophic disaster where State and FEMA regional resources have been, or are expected to be, overwhelmed. These teams consist of highly qualified Headquarters and regional staff. One of these teams will be deployed to the site of a catastrophic disaster to conduct ERT operations from the JFO." (**FEMA,** *Mission Assignment SOPs Operating Draft*, July 2007, p. 56)

National Emergency Response Team (ERT-N): "When a significant disaster occurs, an Emergency Response Team, Advance Element (ERT-A) is dispatched by the affected FEMA region to join with State emergency management personnel to coordinate Federal assistance. ERT-A positions are filled based on the type of disaster and the nature of the requirement for continued Federal involvement. If the disaster escalates, the FEMA region may strengthen the ERT-A with additional positions within the team and the team is then referred to as an Emergency Response Team (ERT). A National Emergency Response Team (ERT-N) may be assigned to **disasters of national significance** or when the affected FEMA region is unable to fill the ERT requirement." (Emphasis added; **FEMA**, *US&R IST In Federal Disaster Operations,* January 2000, p. 1-1)

National Emergency Technology (NET) Guard: "The Department of Homeland Security's Federal Emergency Management Agency (FEMA) announced today $320,000 is available in Fiscal Year (FY) 2008 to pilot, test, and develop tools for a potential new Citizen Corps (CC) National Emergency Technology Guard (NET GUARD) Program. NET Guard teams will be comprised of volunteers with information technology (IT) and communications expertise to assist States and localities in responding to and recovering from incidents that cause significant damage or destruction to IT and communications infrastructure. Teams will be a local asset, managed at the local level, and deployed in response to a request from local or State authorities." (**FEMA**, *FEMA Announces Solicitation to Pilot Citizen Corps Net Guard*, June 19, 2008)

National Essential Functions (NEFs): "The eight functions the President and national leadership will focus on to lead and sustain the nation during a catastrophic emergency." (**DHS**, *FCD 2*, Nov. 2007, p. C-1)

National Essential Functions (NEFs): "`National Essential Functions,' or 'NEFs,' means that subset of Government Functions that are necessary to lead and sustain the Nation during a catastrophic emergency and that, therefore, must be supported through COOP and COG capabilities. The following NEFs are the foundation for all continuity programs and capabilities and represent the overarching responsibilities of the Federal Government to lead and sustain the Nation during a crisis, and therefore sustaining the following NEFs shall be the primary focus of

the Federal Government leadership during and in the aftermath of an emergency that adversely affects the performance of Government Functions:

(a) Ensuring the continued functioning of our form of government under the Constitution, including the functioning of the three separate branches of government;

(b) Providing leadership visible to the Nation and the world and maintaining the trust and confidence of the American people;

(c) Defending the Constitution of the United States against all enemies, foreign and domestic, and preventing or interdicting attacks against the United States or its people, property, or interests;

(d) Maintaining and fostering effective relationships with foreign nations;

(e) Protecting against threats to the homeland and bringing to justice perpetrators of crimes or attacks against the United States or its people, property, or interests;

(f) Providing rapid and effective response to and recovery from the domestic consequences of an attack or other incident;

(g) Protecting and stabilizing the Nation's economy and ensuring public confidence in its financial systems; and

(h) Providing for critical Federal Government services that address the national health, safety, and welfare needs of the United States." (**White House,** *HSPD-20*, May 9, 2007)

National Exercise Division (NED), FEMA/NPD/NIC/NED: "The NED provides exercise and evaluation policy and planning support to FEMA, DHS, the Federal Interagency, and State and local stakeholders." (**FEMA/NPD/NIC**, slide 6)

National Exercise Program (NEP): "The NEP is the Nation's overarching exercise program formulated by the National Security Council / Homeland Security Council (NSC/HSC), and executed by the Federal Interagency. All interagency partners have adopted HSEEP as the methodology for all exercises that will be conducted as part of the NEP." (**DHS**, *FCD 1*, Nov. 2007, P-7)

National Exercise Program (NEP): "NEP activities provide emergency responders and policymakers with the tools to plan, organize, conduct, and evaluate exercises as well as a disciplined approach to analyzing findings from exercises. The NEP not only provides opportunities to practice and test capabilities, policies, plans and procedures, but it also highlights potential shortfalls through the processes of after-action reporting and subsequent improvement activities.

"Prior to the NEP, there was no formal approach to prioritizing, scheduling and improvement planning for exercises. This lack of coordination resulted in activities that competed for

resources, contributed to exercise fatigue, and were based on conflicting standards for exercise design, conduct and evaluation. The NEP is designed to provide a framework for prioritizing and focusing Federal and State exercise activities to best utilize departments', agencies' and jurisdictions' limited time and resources, as well as to ensure Federal, State, and local exercises lead to significant improvements in policies, plans and performance.

"The NEP is both a National and an interagency program. It serves as the principal mechanism for examining the preparation and efficiency of national leaders, their staffs, the organizations and systems they lead, as well as to examine and adopt policy changes. The NEP does not preclude or replace individual departments' and agencies' exercise programs. Rather, it is the overarching exercise program that unifies homeland security preparedness exercise strategies and links appropriate department and agency exercises to provide a single, comprehensive exercise program."

"The NEP implements a strategic planning cycle to guide the Tier I exercises, or NLEs. Central to this cycle is the Five-Year Schedule, which will incorporate policy priorities into the strategic scheduling of NLEs, around which departments and agencies can establish supporting training and exercise activities to identify and refine issues beforehand. The Tier I NLEs will be executed on a four-year subject-specific cycle with rotating focus on:

- Administration Transition Training;
- Domestic Natural Disasters;
- National Security; and
- Domestic Terrorism." (**FEMA**, *Statement of Dennis Schrader*, October 2007, pp. 2-4)

"The NEP requires Departments and Agencies to fully fund their respective responsibilities within the NEP." (**FEMA**, *Statement of Dennis Schrader*, October 2007, p. 7)

National Exercise Program (NEP): "HSPD-8 directed the establishment of the NEP under the leadership of the Secretary of Homeland Security. The NEP is the Nation's overarching exercise program formulated by the National Security Council/Homeland Security Council, and executed by the Federal Interagency. The NEP serves as the principal mechanism for examining the preparation of the Federal executive branch and adopting policy changes that might improve such preparation. The NEP is DHS's principal mechanism for training and exercising officials at all levels of government, as well as members of the private sector, and, at times, our international partners. The NEP has developed common policy and guidance and has established collaborative management processes and tools to link its partners and stakeholders nationwide. Lessons learned and peer-validated best practices identified through exercises and actual incidents are made available to the homeland security community." (**Homeland Security Council,** *National Continuity Policy Implementation Plan*, 2007, p. 65; see, also, Homeland Security Exercise & Evaluation Program)

National Exercise Program (NEP) Corrective Action Program (CAP): "Once exercises are successfully planned and conducted, the Corrective Action Program (CAP) provides for systematically developing, prioritizing, tracking, and analyzing corrective actions for improving exercises, and the planning, training, and equipment which drives the cycle of preparation. The

CAP also provides transferability to real-world incidents and policy discussions by employing a stakeholder-driven approach to improvement planning at the Federal interagency, intra-DHS, and State/local levels. Essentially, the CAP provides a systematic means to prevent recurring problems and identify potential "corrective actions" and "lessons learned," which respectively incorporate the *CAP System* and the web-based Lessons Learned Information Sharing support systems (found at *LLIS.gov*). All lessons learned and best practices are broadly shared through the LLIS.gov on-line tool. The CAP completes the cycle of preparedness by ensuring that exercise evaluation and real-world incidents consistently yield concrete advancement toward specified preparedness goals." (**FEMA**, *Statement of Dennis Schrader*, October 3, 2007, 4-5)

National Exercise Program (NEP) Tiers:

- Tier I: White House directed, Federal government-wide, Strategy & Policy Focus
- Tier II: Federal Strategy & Policy Focus, Significant Simulation.
- Tier III: Other Federal Exercises, Operational, Tactical or Organizational Focus
- Tier IV: State, Territorial, Local, Tribal or Private Sector Focus (Non-Federal) (**FEMA**, *Statement of Schrader*, October 3, 2007)

National Exercise Program Implementation Plan (NEP I-Plan): "The NEP I-Plan describes a new "tier" system of exercises and mandates the use of HSEEP Policy and Guidance for all NEP tiered exercises. Once fully implemented, the NEP will work to encourage greater cooperation and joint exercise planning efforts at not just the Federal interagency level, but on the FEMA Region, State, territorial, tribal and local levels as well. (**FEMA**, *Homeland Security Exercise and Evaluation Program HSEEP Newsletter* (Winter 2008, Issue 7), 5 Feb 2008, p. 2)

National Exercise Schedule (NEXS): "The National Exercise Schedule (NEXS) is a compilation of all National-level, Federal, State, tribal, territorial, and local exercises. The NEXS serves as a management tool and reference document for exercise planning. It provides information on exercise date, location, scenario, scope, and participants. The purpose of the NEXS is to provide visibility of upcoming exercises to leadership, exercise planners, and exercise schedulers.
The NEXS was established to support the directive presented to the Department of Homeland Security (DHS) under Homeland Security Presidential Directive (HSPD)-8. HSPD-8 directs that DHS, in coordination with other appropriate Federal Departments and agencies, establish a "national program and a multi-year planning system to conduct homeland security preparedness-related exercises that reinforces identified training standards, provides for evaluation of readiness, and supports the National Preparedness Goal." **(DHS,** *Homeland Security Exercise and Evaluation Program Toolkit -- The National Exercise Schedule*, September 13, 2007)

National Fire Service Incident Management System (IMS) Consortium: "Recognizing the continuing challenges occurring in the fire service in applying a common approach to incident command, the National Fire Service Incident Management System (IMS) Consortium was created in 1990. Its purpose was to evaluate an approach to developing a single command system. The consortium consisted of many individual fire service leaders, representatives of most major fire service organizations and representatives of federal, state and local agencies, including FIRESCOPE and the Phoenix Fire Department. One of the significant outcomes of the

consortium's work was an agreement on the need to develop operational protocols within ICS, so that fire and rescue personnel would be able to apply the ICS as one common system.

In 1993, the IMS consortium completed its first document: Model Procedures Guide for Structural Firefighting. As a result, FIRESCOPE incorporated the model procedures, thereby enhancing its organizational structure with operational protocols. These changes enabled the nation's fire and rescue personnel to apply the ICS effectively regardless of what region of the country they were assigned to work. The National Fire Academy (NFA), having already adopted the FIRESCOPE ICS in 1980, incorporated this material into its training curriculum as well." (**FEMA**, *NIMS and ICS*, 2004)

National Flood Determination Association (NFDA): "The National Flood Determination Association maintains standards of excellence, fosters professionalism, and advocates quality services within the flood zone determination industry." (**NFDA**, *Welcome*, 2006)

National Flood Insurance Act of 1968: The Act credated a coordinated National Flood Insurance Program, incorporating:

- Risk identification/assessment: mapping of flood prone areas in communities which joined the NFIP.
- Risk mitigation: adoption of a set of floodplain management regulations that cmmunities must agree to adopt and enforce as a condition to their participation in the NFIP.
- Insurance: the federal government was authoized to arrange for the sale of federally supported flood insurance in communities which have joined the program.
- Subsidization: insurance premiums for properties in existence when a community joins the NFIP are subsidized (acturarial premiums for many of these older, high risk properties were considered unaffordable). Insurance for properties constructed after a community joins the program (and thus have presumably been constructed in accordance with flood plain management ordinances) is intended to be set at acturarial levels.
- Attrition of high risk properties: while existing properties were grandfathered from compliance with new floodplain ordinances and could be insured at subsidized rates, a structure damaged more than 50% by flooding must be relocated or reconstructed in compliance with current floodplain management regulations." (Abbott, pp. 132-133)

National Flood Insurance Act of 1968: "…the National Flood Insurance Act of 1968 (NFIA, or "the Act"), 42 U.S.C. 4030, as amended by the Bunning-Bereuter-Blumenauer Flood Insurance Reform Act of 2004, Public Law 108-264, [has]… the goal of reducing flood damages to individual properties for which one or more claim payments for losses have been made under flood insurance coverage and that will result in the greatest savings to the NFIF in the shortest period of time. The Catalog of Federal Domestic Assistance (CFDA) number is 97.092." (**FEMA**, *Repetitive Flood Claims Program Guidance, FY 2008*, 2007, p. 1)

National Flood Insurance Program (NFIP): "The U.S. Congress established the National Flood Insurance Program (NFIP) with the passage of the National Flood Insurance Act of 1968. The NFIP is a Federal program enabling property owners in participating communities to purchase insurance as a protection against flood losses in exchange for State and community

floodplain management regulations that reduce future flood damages. Participation in the NFIP is based on an agreement between communities and the Federal Government. If a community adopts and enforces a floodplain management ordinance to reduce future flood risk to new construction in floodplains, the Federal Government will make flood insurance available within the community as a financial protection against flood losses. This insurance is designed to provide an insurance alternative to disaster assistance to reduce the escalating costs of repairing damage to buildings and their contents caused by floods." (**FEMA**, *National Flood Insurance Program Description*, August, 2002, p. 2)

National Flood Insurance Program (NFIP) Rationale: "The flood insurance program was initiated because it had become clear by the 1950s that private insurance companies could not profitably provide affordable flood coverage because of the catastrophic nature of flooding and the impossibility of developing an actuarial rate structure that could adequately reflect the risk to flood-prone properties, among other reasons. One of the primary purposes of the National Flood Insurance Act of 1968, which created NFIP, was to reduce federal expenditures for disaster assistance and flood control." (**GAO**, *Natural Disasters: Public Policy Options*, Nov 2007, 17)

National Flood Insurance Program (NFIP) Rationale: "…while mortage lenders would rearely advance funds unless a standard 'all risk' (excluding flood) homeowner's polich were in effect, lenders historically were indefferent as to whether a mortgaged structure was insured against damage caused by flood. Finally, local governments tended not to incorporate flood risk or floodplain management into their zoning or land use planning ordinances and building codes." (Abbot, "Floods, Flood Insurance, Litigation, Politics – and Catastrophe…," 2008, p. 132)

National Flood Insurance Reform Act of 1994. NFIRA: Public Law 103-325, Sec. 511 of the Riegle Community Development and Regulatory Improvement Act of 1994, September 23, 1994. (**FEMA**, NFIRA)

National Fusion Center, DHS: "The NOC [DHS National Operations Center] is also the National Fusion Center and consists of five functional components: a 24/7 multiagency watch and preparedness, prevention, and protection coordination center, an interagency planning element, a response and recovery coordination center, and integrated elements of the DHS Office of Intelligence and Information Analysis (DHS/I&A) and the DHS Office of Infrastructure Protection (DHS/IP). These elements work in close coordination to address information / intelligence analysis and response coordination." (**DHS**, *Notice of Change to the NRP*, May 22, 2006, pp. 11-12)

National Guard (NG): "The NG primarily operates under three different command relationships: Federal funding and Federal control (Title 10 USC – "federalized" status); Federal funding and state control (Title 32 USC); and state active duty (state funding and state control)**.** NG forces, unless federalized, operate under the C2 of the governor and adjutant general in state active duty and/or Title 32 status. The NG, when in state status, responds under the governor's control for CS missions in accordance with state laws. However, when NG personnel or units are federalized by order of the President under Title 10 USC, they respond under the same legal restrictions and C2 structures as active component military forces. The NG, when in state status, is also normally the first military responder to CS incidents that require resources beyond the

capabilities of local and other state-level emergency response organizations. Working under the control of the governor, their actions are closely coordinated with those of other agencies, to include any DOD assets committed to the same or related incidents. Additionally, in many states, the adjutant general is also the state's director for emergency management, and as such, not only controls the response of the state's NG forces, but also manages and coordinates the state's response to CBRNE CM in support of local governments." (**JCS/DOD**, *CBRNECM*, 2006, II-11)

National Guard Bureau (NGB): "The National Guard Bureau (NGB) is neither a reserve component nor an operational command. Instead, it coordinates between DOD and the several states and territories on matters pertaining to the National Guard. It also prescribes the discipline and training requirements for the Army National Guard (ARNG) and the Air National Guard (ANG); ensures that units and members of the ARNG and ANG are trained by the states in accordance with programs, policies, and guidance from the Secretaries of the Army and Air Force and the Chief of the National Guard Bureau; and facilitates and supports the training of members and units of the National Guard to meet state requirements. Since the terrorist attacks of 9/11, the NGB has taken on the responsibility of coordinating the movement of National Guard forces in Title 32 status; once in state, they are commanded by the governor." (**Commission on the National Guard and Reserves**, *Transitioning*, 2008, B-2 (387 of 448)

National Guard CBRNE Enhanced Response Force Package (CERFP): "regional capability to locate and extract victims from a contaminated environment, perform medical triage and treatment, and conduct personnel decontamination in a WMD event. Each CERFP task force works in coordination with other military forces and commands as part of the overall national response of local, State and Federal assets and has a regional responsibility as well as the capability to respond to major CBRNE incidents anywhere within the US or worldwide. This capability augments the WMD CST and provides a task force-oriented structure that can respond on short notice." (**FEMA**, *Statement of Glenn Cannon*, November 15, 2007, p. 12)

National Guard Reaction Force (NGRF): "NGRF's provide every state with a combat ready arms force capable of delivering, at the request of the governor or resident, a unit of 50-75 personnel within 4-8 hours and a follow-on force of up to 400 personnel within 24-36 hours. NGRFs are a critical element of the first line of counter-terrorism defense and are designed to respond to an incident well ahead of Federal assets. They deploy with the capability to be logistically self-sustaining for 48 hours. NGRFs are formed from current unit and personnel resources and are organized as temporary task forces. As such, their mission primarily falls under the command and control of the governors of their home states. They will be, first and foremost, state assets, operationally falling under the command and control of the State Adjutant General. Missions include, but are not limited to (a) providing site security, (b) providing presence patrols and shows of force, (c) establishing roadblocks, check points, or both, (d) controlling civil disturbances and (e) protecting DoD selected critical infrastructure." (**Blum**, July 19, 2007, p. 6)

National Guard Reaction Force (NGRF): "units that are pre-designated for quick response and available to the Governors to support State and local response." (**FEMA**, *Statement of Glenn Cannon*, November 15, 2007, p. 12)

National Guard WMD Civil Support Teams (CST): "55 highly skilled, full-time teams, established to provide specialized WMD expertise and technical assistance to an incident commander to assess, assist, advise, and facilitate follow-on forces. Governors have operational command and control of the teams and NGB provides logistical support, standardized operational procedures, and operational coordination to facilitate the employment of the teams." (**FEMA**, *Statement of Glenn Cannon*, November 15, 2007, p. 12)

National Health Security Strategy: "Beginning in 2009 and every four years thereafter, the Secretary shall prepare and submit to the relevant committees of Congress a coordinated strategy (to be known as the National Health Security Strategy) and any revisions thereof, and an accompanying implementation plan for public health emergency preparedness and response. Such National Health Security Strategy shall identify the process for achieving the preparedness goals described in subsection (b) and shall be consistent with the National Preparedness Goal, the National Incident Management System, and the National Response Plan developed pursuant to section 502(6) of the Homeland Security Act of 2002, or any successor plan." (**Pandemic and All-Hazards Preparedness Act**, January 3, 2006, Sec. 2802 (a) (1).)

National Homeland Defense Foundation (NHDF): "The National Homeland Defense Foundation (NHDF) exists for the purpose of Securing the Future of Liberty™ through sharing of innovation, research, and education. In addition to conducting an annual Symposium, the…. NHDF projects serve to preserve liberty through humanitarian, security and preparedness programs, and educational efforts. Particular focus will be given to those programs and projects that support, educate, and inform moderate Muslim communities and nations on the concepts of tolerance, human co-existence, and compassion for all mankind. Education Initiatives in HD/HS: Support, encourage, and advocate educational programs and curricula that are constructed for the purpose of teaching homeland defense/security disciplines to all levels of study." (**NHDF**, 2008)

National Homeland Security Agency. The entity proposed by **Hart-Rudman Commission** (United States Commission on National Security/21st Century) "to consolidate and refine the missions of the nearly two dozen disparate departments and agencies that have a role in U.S. homeland security today." (Hart-Rudman, *Road Map for National Security: Imperative for Change (Phase III Report)* 15 Feb 2001, p. vi)

National Homeland Security Consortium: "The National Homeland Security Consortium is a unique, one-of-a- kind group of key state and local organizations, elected officials, the private sector and others with roles and responsibilities for homeland security prevention, preparedness, response and recovery activities. Participating organizations began meeting together in 2002 at the invitation of the National Emergency Management Association (NEMA). The National Homeland Security Consortium is an outgrowth of those initial discussions regarding the need for enhanced communication and coordination between disciplines and levels of government. The Consortium is now a recognized entity by the U.S. Department of Homeland Security and works in partnership with other federal agencies such as the Department of Health and Human Services Centers for Disease Control.

"The Consortium meets at least two times annually and shares information on a regular basis on issues of common interest. Subject matter experts within the Consortium are available as needed to provide input on national strategies, plans and policies impacting state and local governments.

Vision: Enhanced homeland security to prevent, prepare for, respond to and recover from emergencies, disasters and catastrophes through strategic partnerships, collaborative strategies and information sharing.

Mission: Provide a forum of key national organizations through effective communication, collaboration, and coordination that positively promotes national policies, strategies, practices and guidelines to preserve the public health, safety and security of the nation.

Objectives:
1. Provide a broad-based resource and sounding board on homeland security issues for all national stakeholders.
2. Share information, knowledge, experiences, and practices.
3. Contribute to the homeland security debate and discussion.
4. Focus efforts to resolve issues.
5. Develop recommendations in identified areas of common interest.

Participating Members of the National Homeland Security Consortium

- Adjutants General Association of the United States
- American Public Works Association
- Association of Public Safety Communications Officials
- Association of State & Territorial Health Officials
- The Council of State Governments
- International Association of Emergency Managers
- International Association of Chiefs of Police
- International Association of Fire Chiefs
- International City/County Management Association
- National Association of Counties
- National Association of County & City Health Officials
- National Association of State Departments of Agriculture
- National Association of State Emergency Medical Service Directors
- National Conference of State Legislatures
- National Emergency Management Association
- National Governors' Association
- National League of Cities
- National Sheriffs' Association
- State Homeland Security Advisors
- Urban Area Security Initiative Cities
- U.S. Chamber of Commerce
- Private Sector." (**NEMA**, *National Homeland Security Consortium*, 2007)

National Homeland Security Consortium Priority Issues (July 11-12, 2007 Meeting):

#1 Communication and Collaboration
· There is no local, state, federal partnership.
· What partnership exists is becoming adversarial. Examples include the private National Response Plan rewrite and mischaracterization with the media of unspent homeland security funds.
· Coordination between federal agencies is vital but it is not happening enough. The federal government may need a Cabinet level official(s) or lead agency charged with this responsibility.
· Communication and collaboration is time consuming, but must be done and it's more effectively done at the front end of planning processes. Stakeholders should be engaged early and often.
· DHS collaboration must be with associations and not with individuals when seeking people to speak on behalf of a discipline. Associations must be able to appoint their own representatives to DHS working groups or meetings. Quality and quantity of representation is important. Development of the Target Capabilities List is an example – hundreds of people included in the process but the input did not meet quality standards for individual associations. When DHS requests representation, Associations will be responsive and pledge to work collaboratively. Stakeholders want the system to work. State and local governments are the ones who have to implement federal strategies, plans and programs.
· Why doesn't Office of State and Local Coordination function out of the Secretary's office if it is importance to DHS? Sends negative message and this is one of the reasons that communication and collaboration isn't working right now. There is no single coordination point within DHS for state and local stakeholders that can reach back within the agency on their behalf.
· The Consortium has the ability to easily and effectively provide input to DHS.
· Performance measurement for collaboration is different for DHS than associations. DHS looks at quantity and stakeholders look at quality.
· The relationship with DHS is getting worse, not better
· The priority issues identified by the Consortium are important for this and the next Administration. They will not go away. Could be the basis for a National Strategy the Consortium should develop and deliver in a non-partisan approach.
· Federal agencies are not communicating or working together which leads to a fragmented national approach.

#2 National Guard Capabilities and Use of the Military
· White House is opposed to the repeal of the Insurrection Act amendments.
· Many Consortium members strongly support the repeal and want the governors' authority over use of the National Guard reinstated.
· DHS needs to become better informed on National Guard issues. DHS should consider this an issue of importance to them because it's much broader than they have indicated in their response letter to the Consortium priority issues.
· NHSC wants collaboration on important national issues that can make the emergency response system better. Use of the military is of interest to Consortium members and we will monitor. We expect to be engaged on this issue.

#3 Intelligence and Information Sharing

· Private sector still not recognized.
· Information stovepipes exist for private sector engagement and information sharing.
· A true national strategy is lacking and a policy level discussion is needed. Need to focus on system design and information gathering/sharing process. What does DHS know and who else needs to know it, and what's the process for sharing that information?
· Regulatory and policy issues are not being addressed on a national level.
· More work to be done on actionable intelligence being given to state/local governments.
· Unsure of what is being done with HSIN/HSDN and where it's going.
· Security clearances are road blocks, but can be solved at little cost.

#4 Mutual Aid/Resource Typing/Credentialing and Disaster Response
· DHS continues to focus on their defined "regions" and not "networks" that may be more effective for state and local governments. Regions are not necessarily bound by geography or political boundaries. "Networks" cross traditional boundaries.
· DHS shouldn't constrain initiatives because of administrative rules or grant guidance.
· FEMA needs a private sector office/liaison. Policy and program focus for private sector is missing. Private sector owns most of the nation's infrastructure so they must be included. Major industry is also important.
· DHS/FEMA should financially support state and local governments in the identification and packaging of mutual aid response assets.
· Federal agencies are not coordinating on credentialing.
· All partner organizations/associations need to be included in the resource typing and credentialing process.
· These issues go beyond FEMA and include all federal agencies involved.

#5 Surge Capacity
· There is little activity to address this issue at the federal level. Medical surge is a huge problem for the nation.
· Consortium can't give a "pass" to DHS to defer the issue to other agencies or to state/local government. There is NO surge capacity at state/local level.
· Consortium needs to look beyond DHS to address this issue. We can work together on this issue and the Consortium can bring all partners together to address. No single entity can solve on their own.

#6 Interoperability
· Good work being done; however, states and locals are not exactly sure what we're trying to achieve.
· All levels of government need to agree where we're going and what success means. What does interoperability look like nationally?
· Greater collaboration is needed to address human aspect of interoperability. Technology solutions can't solve everything.
· Adjustments need to be made in the way we think and talk about interoperability. There needs to be the desire to have the right people communicating followed by the ability to make it happen.
· Planning for the future and additional spectrum allocation is key. Consortium members support additional spectrum for public safety. This is an issue of near term relevance.

· Unsure of what the $1B grant program is supposed to achieve. Requirements and expectations not known.
· Public safety communications needs to be a priority for the nation.

#7 Self Determination/All Hazards
· DHS must adopt an all hazards approach and maintain a balance between terrorism and natural disaster preparedness.
· Federal government should set broad goals and let states/locals determine the path to achieve the goals.

#8 Implementation of FEMA Reform Act
· NHSC is monitoring implementation. Differing disciplines have differing concerns.
· No Congressional oversight and DHS is not implementing according to the law. Examples: TSA grants, location of Office of State and Local Coordination.
· Customers not included in planning for implementation, but should have been to help ensure the way changes are implemented is beneficial to the customer.

#9 Real ID/Border Security/Immigration
· Implementation dates are difficult to meet.
· DHS takes up all the time coming up with rules and then states have little time to implement.
· These issues represent significant long-term financial commitments by states. Customer service is a concern. Example: passports backlog.
· DHS is not helping with the way they are putting forth administrative rules. They are hurting and not helping states.

#10 Five-Year Strategic Plan
· DHS needs a multi-year strategic plan, as is being required of the states.
· "Long Term Fiscal Planning for Sustainable Programs"
· Example: DoD has a 5 year budget cycle and DHS does not. This is what is needed." (**NHSC**, *National Homeland Security Consortium Meeting,* July 11-12, 2007, pp. 1-4)

National Homeland Security Plan: "The *National Homeland Security Plan* facilitates Federal homeland security coordination, establishes priorities, and defines roles and responsibilities for preventing, protecting against, responding to, and recovering from man-made or natural disasters. The Secretary, through the Office of Operations Coordination (OPS) and the Federal Emergency Management Agency (FEMA), in coordination with Federal agencies with a role in homeland security, will develop the *National Homeland Security Plan*. The *National Homeland Security Plan* will be released not later than June 2008 and will be revised after the release of the Quadrennial Homeland Security Review and any new *National Strategy for Homeland Security* and Presidential directives." (**DHS**, *IPS Description Draft*, January 3, 2008)

National Homeland Security Plan: "By 30 June 2007, the Assistant Secretary of Defense for Homeland Defense, in partnership with the Department of Homeland Security, and in coordination with the Chairman, and all relevant DOD components, shall provide the Deputy Secretary with a plan of action for establishing a ***National Homeland Security Plan (NHSP)***. The *NHSP* is envisioned to be a detailed pre-event counterpart to the *National Response Plan*,

focused on the deterrence and prevention of attacks aimed at the United States. The plan of action shall be based in part on the following elements:

- A comprehensive interagency review of the *National Response Plan*
- The effect of the new *National Implementation Plan* for the war on terrorism
- The Homeland Security Council-led comprehensive homeland security review." (**DoD**, *Building Partnership* Capacity, 2006, p. 10)

National Hurricane Program: "The National Hurricane Program (NHP) helps protect communities and residents from hurricane hazards through various projects and activities. Established in 1985, the NHP also conducts assessments and provides tools and technical assistance to State and local agencies in developing hurricane evacuation plans. The program is a multi-agency partnership involving numerous Federal agencies, including:

- Federal Emergency Management Agency (FEMA)
- National Oceanic & Atmospheric Association (NOAA)
- National Weather Service (NWS)
- U.S. Department of Transportation (USDOT)
- U.S. Army Corps of Engineers (USACE) (**FEMA**, *NHP*, Dec 3, 2007)

National Hurricane Program Task Force: "In March 1994 the National Hurricane Program Task Force was established to assist the Federal Emergency Management Agency (FEMA) with planning an enhanced Hurricane Program. Several work groups were formed within the Task Force to address proposed components of that program. Since, for several years, the preexisting Interagency Coordinating Committee on Hurricanes (ICCOH) had managed hazards analysis, population preparedness, and post-storm analysis issues related to the Population Preparedness Project (Hurricane Evacuation Study) phase of FEMA's Hurricane Program, that committee was asked to function as a Task Force work group for those topics. To support the work of the ICCOH, Headquarters, U.S. Army Corps of Engineers (USACE) subsequently organized the Hurricane Evacuation Studies Technical Guidelines Working Group." (**USACE**, *Info on HES*)

National Implementation Plan for The War on Terrorism (NIP-WOT): "Early this summer [2006], a new strategy for combating terrorism, described by its authors as "revolutionary" in concept, arrived on President Bush's desk. The highly classified National Implementation Plan for the first time set government-wide goals and assigned responsibility for achieving them to specific departments and agencies. Written by officials at the National Counterterrorism Center, under a directive signed by the president last winter, the 160-page plan aspires to achieve what has eluded the Bush administration in the five years since the Sept. 11, 2001, attacks: bringing order and direction to the fight against terrorism….

New initiatives such as the National Implementation Plan were launched to eliminate overlap and set priorities for what the administration now calls the "long war." Beyond drawing sharper lines of responsibility, officials said, the plan is designed to drag the nation's counterterrorism strategy back from military dominance, better balancing the military "whack" with diplomacy and the "hearts and minds" campaigns that are now seen as critical to long-term victory. [President] Bush was briefed on the plan on June 26. A White House official said the plan reflects [President] Bush's feeling that the terrorism fight is "all-encompassing," including military attacks but also "the war of ideas and the softer side, the long-term battle."

Within half a dozen broad objectives, the document designates lead and subordinate agencies to carry out more than 500 discrete counterterrorism tasks, among them vanquishing al-Qaeda, protecting the homeland, wooing allies, training experts in other languages and cultures, and understanding and influencing the Islamic psyche." (**DeYoung**, *Washington Post*, Aug. 9, 2007)

National Incident Communications Conference Line (NICCL): A "pre-identified incident communications protocols are established and ready for use during large scale incidents and incidents requiring a coordinated Federal response… The NICCL was created to be a single source of coordination for DHS with all other Federal agencies. It can work as a call-in conference or as an open line that can be monitored 24 hours a day for the exchange of information and updates. It is primarily for Federal-to-Federal information sharing but can also include communicators from the primarily impacted State and local community. Specifically, the NICCL:

- is used for transmission and exchange of information primarily targeted to support senior State and local officials;
- originates with DHS Public Affairs and is an executive call to discuss happening events and their agencies' roles, activities, and response; and
- is typically conducted twice daily, but it could be staffed 24 hours a day and used as an open line for information dissemination if required by an incident." (**FEMA**, *Basic Guidance for PIOs*, Nov 2007, pp. 24-25)

National Incident Management Planning/National Domestic Incident Response Planning: "National incident management planning occurs in a networked, collaborative environment, which requires iterative dialogue among senior leaders, concurrent and parallel plan development, and collaboration across multiple planning levels. Clear strategic guidance and frequent interaction between senior leaders and planners promote early understanding of, and agreement on, planning assumptions, considerations, risks, and other key factors. A good plan identifies key decision points and provides senior leaders with options. Plans should be responsive, flexible and evolving. As they are developed, the iterative nature of good planning promotes greater involvement within the interagency planning communities of interest (COI) and our multinational partners." (**DHS**, 2007)

National Incident Management Priorities. "The NRP sets national incident management priorities. These priorities include

- saving lives and protecting the health and safety of the public, responders, and recovery workers;
- preventing an imminent incident, including acts of terrorism, from occurring;
- protecting and restoring critical infrastructure and key resources; and
- facilitating recovery of individuals, families, businesses, governments, and the environment." (**DHS**, 2007)

National Incident Management System (NIMS): "HSPD-5 requires all Federal departments and agencies to adopt the NIMS and to use it in their individual domestic incident management and emergency prevention, preparedness, response, recovery, and mitigation programs and activities, as well as in support of those actions taken to assist State, local, or tribal entities. The directive also

requires Federal departments and agencies to make adoption of the NIMS by State, tribal and local organizations a condition for Federal preparedness assistance beginning in FY 2005. Compliance with certain aspects of the NIMS will be possible in the short-term, such as adopting the basic tenets of the Incident Command System… Other aspects of the NIMS, however, will require further development and refinement to enable compliance at future dates." (**DHS**, *NIMS*, 2004, DHS Secretary Tom Ridge Memorandum for Distribution)

National Incident Management System (NIMS): Released in March 2004 by the Department of Homeland Security, *NIMS* "provides a consistent nationwide template to enable all levels of government, the private sector and nongovernmental organizations (NGOs) to work together during an incident." (**DHS**, *NRF Comment Draft*, September 2007, 45)

National Incident Management System (NIMS): "The *NIMS* identifies multiple elements of unified command in support of incident response. These elements include: (1) developing a single set of objectives; (2) using a collective, strategic approach; (3) improving information flow and coordination; (4) creating common understanding of joint priorities and restrictions; (5) ensuring that no agency's legal authorities are compromised or neglected; and (6) optimizing the combined efforts of all agencies under a single plan." (**DHS**, *NRF Comment Draft*, Sep 2007, 10)

National Incident Management System (NIMS): "*NIMS* provides a core set of common concepts, principles, terminology and technologies in the following areas:

Incident Command System (ICS). Much of *NIMS* is built upon the ICS, which was developed by the Federal, State and local wildland fire agencies during the 1970s. ICS is normally structured to facilitate activities in five major functional areas: command, operations, planning, logistics and finance/ administration. In some circumstances, intelligence and investigations may be added as a sixth functional area.

Multi-agency coordination systems. Examples of multi-agency coordination systems include a county emergency operations center, a State intelligence fusion center, the DHS National Operations Center, the DHS/Federal Emergency Management Agency (FEMA) National Response Coordination Center, the Department of Justice/Federal Bureau of Investigation (FBI) Strategic Information and Operations Center and the National Counterterrorism Center.

Unified command. Unified command provides the basis from which multiple agencies can work together effectively with a common objective of effectively managing an incident. Unified command ensures that regardless of the number of agencies or jurisdictions involved, all decisions will be based on mutually specified objectives.

Training. Leaders and staff require initial training on incident management and incident response principles, as well as ongoing training to provide updates on current concepts and procedures.

Identification and management of resources. Classifying types of resources is essential to ensure that multiple agencies can effectively communicate and provide resources during a crisis.

Situational awareness. Situational awareness is the provision of timely and accurate information during an incident. Situational awareness is the lifeblood of incident management and effective response operations. Without it, decisions will not be informed by information on the ground and actions will be inefficient and ineffective. Situational

awareness requires continuous monitoring, verification and integration of key information needed to assess and respond effectively to threats, potential threats, disasters or emergencies.

Qualifications and certification. Competent staff is a requirement for any leader managing an incident. During a crisis there will not be time to determine staff qualifications, if such information has not yet been compiled and available for review by leaders. To identify the appropriate staff to support a leader during a crisis, qualifications based on training and expertise of staff should be pre-identified and evidenced by certification, if appropriate.

Collection, tracking and reporting of incident information. Information today is transmitted instantly via the Internet and the 24/7 news channels. While timely information is valuable, it also can be overwhelming. For an effective response, we must leverage expertise and experience to identify what information is needed to support decision-makers and be able to rapidly summarize and prioritize this information. Information must be gathered accurately at the scene and effectively communicated to those who need it. To be successful, clear lines of information flow and a common operating picture are essential….

Crisis action planning. Deliberative planning during non-incident periods should quickly transition to crisis action planning when an incident occurs. Crisis action planning is the process for rapidly adapting existing deliberative plans and procedures during an incident based on the actual circumstances of an event. Crisis action planning should also include the provision of decision tools for senior leaders to guide their decision-making.

Exercises. Consistent with the National Exercise Program, all stakeholders should regularly exercise their incident management and response capabilities and procedures to ensure that they are fully capable of executing their incident response responsibilities." (**DHS**, *NRF Comment Draft*, September 2007, pp. 46-47)

National Incident Management System (NIMS): "…provides standard command and management structures that apply to response activities. This system provides a consistent, nationwide template to enable Federal, State, tribal, and local governments, the private sector, and NGOs to work together to prepare for, prevent, respond to, recover from, and mitigate the effects of incidents regardless of cause, size, location, or complexity. This consistency provides the foundation for utilization of the *NIMS* for all incidents, ranging from daily occurrences to incidents requiring a coordinated Federal response." (**DHS,** *NRF*, Jan 2008, 4)

National Incident Management System (NIMS): "NIMS is not an operational incident management or resource allocation plan. NIMS represents a core set of doctrine, concepts, principles, terminology, and organizational processes that enables effective, efficient, and collaborative incident management." (**FEMA**, *NIMS* (FEMA 501/Draft), 2007, p.3)

National Incident Management System (NIMS): "Provides a systematic, proactive approach guiding government agencies at all levels, the private sector, and nongovernmental organizations to work seamlessly to prepare for, prevent, respond to, recover from, and mitigate the effects of incidents, regardless of cause, size, location, or complexity, in order to reduce the loss of life or property and harm to the environment." (**FEMA**, *NIMS* (FEMA 501/Draft), 2007, p. 155) [See, by way of comparison, the *Public Law* definition of NIMS noted below, as well as the NGA definition of Comprehensive Emergency Management, and FEMA's definitions of EM.]

National Incident Management System (NIMS): "…the term 'National Incident Management System' means a system to enable effective, efficient, and collaborative incident management…" (**Public Law 109-295**, *Department of Homeland Security Appropriations Act, 2007*, p. 41).

National Incident Management System (NIMS): Called for in Homeland Security Presidential Directive 5: "This system will provide a consistent nationwide approach for Federal, State, and local governments to work effectively and efficiently together to prepare for, respond to, and recover from domestic incidents, regardless of cause, size, or complexity. To provide for interoperability and compatibility among Federal, State, and local capabilities, the NIMS will include a core set of concepts, principles, terminology, and technologies covering the incident command system; multi-agency coordination systems; unified command; training; identification and management of resources (including systems for classifying types of resources); qualifications and certification; and the collection, tracking, and reporting of incident information and incident resources." (**White House,** *HSPD-5***,** February 28, 2003)

National Incident Management System (NIMS): "NIMS focuses largely on stakeholders in the discipline of response." (**White House**, *National Strategy for Homeland Security*, Oct 2007, p46)

National Incident Management System (NIMS) Capability Assessment Support Tool (NIMSCAST): "A web-based self-assessment tool designed to aid State, Territorial, local, and tribal organizations and jurisdictions in determining their capabilities and compliance against the requirements." (**FEMA**, *NIMS Compliance Metrics Terms of Reference*, October 2006, p. 6)

National Incident Management System (NIMS) Command and Coordination Authority: "NIMS distinguishes between command authority and coordination authority. Command authority is vested in the incident commander, whether a single incident commander or an area commander, and is exercised through the ICS. Coordination authority is vested in coordinating officers such as the FCO and DCO. Each coordinating officer has the authority to make coordinating decisions within his or her jurisdiction, whether federal, state, or local." (**JCS/DoD**, *Civil Support*, 2007, p. D-16)

National Incident Management System (NIMS) Compliance Assistance Support Tool. NIMSCAST: "Federal Emergency Management Agency's National Integration Center - Incident Management Systems Division developed the NIMSCAST to help State, territorial, tribal, and local jurisdictions to maintain their national baseline compliance, as established in FYs 2005-2006, compliance with the NIMS…. The NIMS Compliance Assistance Support Tool (NIMSCAST) is designed as the premier, web-based self-assessment instrument for State, territorial, tribal, local governments to evaluate and report their jurisdiction's achievement of all NIMS implementation activities released since 2004. The NIMSCAST is designed for the emergency management community as a comprehensive self-assessment support tool. Using the NIMSCAST will assist the nation's emergency management community to comply with NIMS requirements, as determined by the National Integration Center. Additionally, HSPD-5 requires Federal Departments and agencies to make adoption of the NIMS by State and local organizations a condition for Federal preparedness assistance. The NIMSCAST facilitates the

adoption of the NIMS by State, local, and tribal governments in order to meet the requirement established in HSPD-5." (FEMA, *About NIMSCAST*)

National Incident Management System (NIMS) Components: "Five major components make up…[the] systems approach [to NIMS]:

Preparedness,
Communications and Information Management,
Resource Management,
Command and Management, and
Ongoing Management and Maintenance." (**FEMA**, *NIMS* (FEMA 501/Draft), 2007, 7)

National Incident Management System (NIMS) Concepts and Principles: "To provide this framework for interoperability and compatibility, the NIMS is based on an appropriated balance of flexibility and standardization.

1. Flexibility.

   The NIMS provides a consistent, flexible, and adjustable national framework within which government and private entities at all levels can work together to manage domestic incidents, regardless of their cause, size, location, or complexity. This flexibility applies across all phases of incident management: prevention, preparedness, response, recovery, and mitigation.

2. Standardization

   The NIMS provides a set of standardized organizational structures – such as the Incident Command System (ICS), multiagency coordination systems, and public information systems – as well as requirements for processes, procedures, and systems designed to improve interoperability among jurisdictions and disciplines in various areas, including: training, resource management; personnel qualification and certification; equipment certification; communications and information management; technology support; and continuous system improvement." (**DHS**, *NIMS*, March 2004, p. 2)

National Incident Management System (NIMS) Concepts: "NIMS is based upon the concepts of

interoperability,
reliability,
scalability,
portability, and
the resiliency and redundancy of communication and information systems."
(**FEMA**, *NIMS* (FEMA 501/Draft), 2007, p. 7)

National Incident Management System (NIMS) History: "…NIMS, the nation's first ever multi-discipline, intergovernmental standardized incident management plan, was based on the highly successful Incident Command System pioneered and used for more than 30 years by America's fire services." (**DHS**, *Remarks by Secretary Michael Chertoff, U.S. Department of Homeland Security at the International Association of Fire Chiefs Leadership Summit*, 4Nov05)

National Incident Management System (NIMS) History: "NIMS is based in large part on SEMS [CA Standardized Emergency Management System] and the Incident Command Structure."[87] (**Little Hoover Commission**, *Safeguarding the Golden State*, 2006, 11)

National Incident Management System (NIMS History): "The creation of NIMS stemmed from an earlier system called the National Interagency Incident Management System (NIIMS) first adopted in 1982 by the National Wildfire Coordinating Group based upon its successes during the 1970s. (**Perkins**, *Shaping DHS Doctrine for Operational Success*, July 2007, p. 22)

National Incident Management System (NIMS) Integration Center: Promulgated by Department of Homeland Security Management Directive System Directive, MD Number 9500. Responsibilities:

1. Developing a national program for NIMS education and awareness, including specific instruction on the purpose of NIMS and responsibilities of the NIC as set forth in this directive and in strategic or other plans;
2. Promoting compatibility between national-level standards for the NIMS and those developed by other public, private, and/or professional groups;
3. Facilitating the development and publication of materials (such as supplementary documentation and desk guides) and standardized templates to support implementation and continuous refinement of the NIMS;
4. Developing assessment criteria for the various components of the NIMS, as well as compliance requirements and compliance timelines for Federal, State, local, and tribal entities regarding NIMS standards and guidelines;
5. Facilitating the definition of general training requirements and the development of national-level training standards and course curricula associated with the NIMS, including the following:
    a. The use of modeling and simulation capabilities for training and exercise programs;
    b. Field-based training, specification of mission-essential tasks, requirements for specialized instruction and instructor training, and course completion documentation for all NIMS users; and
    c. The review and recommendation (in coordination with national professional organizations and Federal, State, local, tribal, private-sector, and nongovernmental entities) of discipline-specific NIMS training courses
6. Facilitating the development of national standards, guidelines, and protocols for incident management training and exercises, including consideration of existing exercise and training programs at all jurisdictional levels;
7. Facilitating the establishment and maintenance of a publication management system for documents supporting the NIMS and other NIMS-related publications and materials, including the development or coordination of general publications for all NIMS users, as well as their issuance via a NIMS publication management system;
8. Reviewing (in coordination with appropriate national professional standards-making, certifying, and accrediting organizations and with input from Federal, State, local, tribal,

[87] Cited: Guna Selvaduray, Professor and Executive Director, Collaborative for Disaster Mitigation, San Jose State University. January 26, 2006. Testimony to the Commission.

private-sector and nongovernmental entities) of the discipline-specific publication management requirements submitted by professional organizations and associations;

9. Facilitating the development and publication of national standards, guidelines, and protocols for the qualification and certification of emergency responder and incident management personnel, as appropriate;
10. Reviewing and approving (with the assistance of national professional organizations and with input from Federal, State, local, tribal, private-sector, and nongovernmental entities), as appropriate, the discipline-specific qualification and certification requirements submitted by emergency responder and incident management organizations and associations;
11. Facilitating the establishment and maintenance of a documentation and database system related to qualification, certification, and credentialing of incident management personnel and organizations, including reviewing and approving (in coordination with national professional organizations and with input from the Federal, State, local, tribal, private-sector and nongovernmental entities), as appropriate, of the discipline-specific requirements submitted by functionally oriented incident management organizations and associations;
12. Establishing a data maintenance system to provide incident managers with the detailed qualification, experience, and training information needed to credential personnel for prescribed "national" incident management positions;
13. Coordinating minimum professional certification standards and facilitation of the design and implementation of a credentialing system that can be used nationwide;
14. Facilitating the establishment of standards for the performance, compatibility, and interoperability of incident management equipment and communications systems, including the following:
    a. Facilitating, in coordination with appropriate Federal agencies, standards-making, certifying, and accrediting organizations, and appropriate State, local, tribal, private-sector, and nongovernmental organizations, the development and/or publication of national standards, guidelines, and protocols for equipment certification (including the incorporation of standards and certification programs already in existence and used by incident management and emergency response organizations nationwide)
    b. Reviewing and approving (in coordination with national professional organizations and with input from Federal, State, local, tribal, private-sector, and nongovernmental entities) lists of equipment that meet these established equipment certification requirements
    c. Collaborating with organizations responsible for emergency responder equipment evaluation and testing
15. Facilitating the development and issuance of national standards for the typing of resources;
16. Facilitating the definition and maintenance of the information framework required to guide the development of NIMS information systems, including the development of data standards for the following: incident notification and situation reports, status reporting, analytical data, geospatial information, wireless communications, identification and authentication, and incident reports, including "lessons learned" reports;

17. Coordinating the establishment of technical and technology standards for NIMS users in concert with the Under Secretary for Science and Technology of the Department of Homeland Security and recognized SDOs;
18. Integrating into the national R&D agenda, in coordination with the Under Secretary for Science and Technology of the Department of Homeland Security, the incident management science and technology needs of departments, agencies, disciplines, private-sector, and nongovernmental organizations operating within the NIMS at all levels; and
19. Establishing and maintaining a repository and clearinghouse for reports and lessons learned from actual incidents, training, and exercises, as well as for best practices, model structures, and model processes for NIMS-related functions." (**DHS**, *Management Directive 9500, NIMS Integration Center*, 2004, pp. 2-3) [Note: In April 2007 the NIC (NIMS Integration Center became the Incident Management Systems Division within the new National Integration Center.][88]

National Incident Management System (NIMS) Planning Process: "The NIMS planning process described below represents a template for strategic, operational, and tactical planning that includes all steps an IC and other members of the Command and General Staffs should take to develop and disseminate an Incident Action Plan (IAP). The planning process may begin with the scheduling of a planned event, the identification of a credible threat, or with the initial response to an actual or impending event. The process continues with the implementation of the formalized steps and staffing required to develop a written IAP…. The planning process should provide the following:

- current information that accurately describes the incident situation and resource status;
- predictions of the probable course of events;
- alternative strategies to attain critical incident objectives; and
- an accurate, realistic, IAP for the next operational period.

"Five primary phases must be followed, in sequence, to ensure a comprehensive IAP. These phases are designed to enable the accomplishment of incident objectives within a specified time…. The five primary phases in the planning process are:

1. Understand the Situation.

…gathering, recording, analyzing, and displaying situation and resource information in a manner that will ensure a clear picture of the magnitude, complexity, and potential impact of the incident; and the ability to determine the resources required to develop and implement an effective IAP.

2. Establish Incident Objectives and Strategy.

…formulating and prioritizing incident objectives and identifying an appropriate strategy. The incident objectives and strategy must conform to the legal obligations and management objectives of all affected agencies. Reasonable alternative strategies that will accomplish overall incident objectives are identified, analyzed, and evaluated to determine the most appropriate strategy for the situation at hand. Evaluation criteria include public health and safety factors; estimated costs; and various environmental, legal, and political considerations.

3. Develop the Plan.

[88] See FEMA, *NIMS Alert*, April 27, 2007, footnote 1.

> [Determine] the tactical direction and the specific resource, reserves, and support requirements for implementing the selected strategy for one operational period. This phase is usually the responsibility of the IC, who bases decisions on resources allocated to enable a sustained response. After determining the availability of resources, the IC develops a plan that makes the best use of these resources….

4. Prepare and Disseminate the Plan.

> [Prepare] the plan in a format that is appropriate for the level of complexity of the incident. For the initial response, the format is a well-prepared outline for an oral briefing….

5. Evaluate and Revise the Plan.

> The planning process includes the requirement to evaluate planned events and check the accuracy of information to be used in planning for subsequent operational periods. The General Staff should regularly compare planned progress with actual progress. When deviations occur and when new information emerges, that information should be included in the first step of the process used for modifying the current plan or developing the plan for the subsequent operational period." *(***DHS**, *NIMS*, 2004, pp. 97-98)

National Incident Management System (NIMS) Premise: "NIMS is based on the premise that the utilization of a common incident management framework will give emergency management/response personnel a flexible yet standardized system for emergency management and incident response activities." (**FEMA**, *NIMS* (FEMA 501/Draft), 2007, p. 6)

National Incident Management System (NIMS) Preparedness Concepts and Principles:

- Levels of Capability.

  Preparedness is implemented through a continuous cycle of planning, training, equipping, exercising, evaluating, and taking action to correct and mitigate. Within the NIMS, preparedness focuses on guidelines, protocols, and standards for planning, training, personnel qualification and certification, equipment certification, and publication management.
- A Unified Approach.

  Preparedness requires a unified approach. A major objective of preparedness efforts is to ensure mission integration and interoperability in response to emergency crises across functional and jurisdictional lines, as well as between public and private organizations.
- NIMS Publications.

  The NIMS provides or established processes for providing guidelines; protocols; standards for planning, training, qualifications and certification; and publication management…
- Mitigation.

  Examples of key mitigation activities include the following:
  - Ongoing public education and outreach activities designed to reduce loss of life and destruction of property;
  - Structural retrofitting to deter or lessen the effects of incidents and reduce loss of life, destruction of property, and effects on the environment;
  - Code enforcement through such activities as zoning regulation, land management, and building codes; and

- Flood insurance and the buy-out of properties subjected to frequent flooding, etc. (**DHS**, *NIMS*, 2004, pp. 33-34)

National Incident Management System (NIMS) Preparedness Programs:

- Preparedness Planning.
  - Emergency Operations Plan (EOP).
  - Procedures
  - Preparedness Plans.
  - Corrective Action Plans
  - Mitigation Plans.
  - Recovery Plans.
- Training and Exercises.
- Personnel Qualification and Certification.
- Equipment Certification.
- Mutual-Aid Agreements.
- Publication Management. (**DHS**, *NIMS*, 2004, pp. 35-41)

National Incident Management System (NIMS) Resource Management Principles:

- Individual Resources
- Emergency Support Functions
- Pre-Scripted Mission Assignments
- Advanced Readiness Contracting
- Pre-Positioned Resources (**DHS**, *National Response Framework*, Jan 2008, 30)

National Incident Management System (NIMS) Resource Typing System: "The resource typing protocol provided by the NIMS describes resources using category, kind, components, metrics, and type data. The following data definitions will be used:

1. Resource: For purposes of typing, *resources* consist of personnel, teams, facilities, supplies, and major items of equipment available for assignment to or use during incidents. Such resources may be used in tactical support or supervisory capacities at an incident site or EOC. Their descriptions include category, kind, components, metrics, and type.

2. Category: A *category* is the function for which a resource would be most useful….

3. Kind: *Kind* refers to broad classes that characterize like resources, such as teams, personnel, equipment, supplies, vehicles, and aircraft. For example…urban search and rescue (US&R) teams consist of two 31- person teams, four canines, and a comprehensive equipment cache. The cache is divided into five separate, color-coded elements and is stored in containers that meet specific requirements.

5. Metrics: *Metrics* are measurement standards. The metrics used will differ depending on the kind of resource being typed. The mission envisioned determines the specific metric selected. The metric must be useful in describing a resource's capability to support the mission. As an example, one metric for a disaster medical assistance team is the number of patients it can care

for per day. Likewise, an appropriate metric for a hose might be the number of gallons of water per hour that can flow through it. Metrics should identify capability and/or capacity.

6. Type: *Type* refers to the level of resource capability. Assigning the Type I label to a resource implies that it has a greater level of capability than a Type II of the same resource (for example, due to its power, size, or capacity), and so on to Type IV. Typing provides managers with additional information to aid the selection and best use of resources. In some cases, a resource may have less than or more than four types; in such cases, either additional types will be identified, or the type will be described as "not applicable." The type assigned to a resource or a component is based on a minimum level of capability described by the identified metric(s) for that resource…" (**DHS**, *NIMS*, 2004, pp.121-124)

National Incident Management System (NIMS) Systems Approach Six Major Components:

- Command and Management
- Preparedness
- Resource Management
- Communications and Information Management
- Supporting Technologies
- Ongoing Management

(**DHS**, *NIMS*, March 2004, p. 3) [Note, compare to 2007 NIMS Five Components, noted above, wherein "Supporting Technologies" is no longer included.]

National Incident Management System (NIMS) Unity of Effort/Unity of Command (DOD): "Joint forces performing CBRNE CM [Consequence Management] supporting civil authorities are part of domestic incident management and operate in accordance with the NRP. The NIMS forms the foundation for conducting domestic response operations. This framework provides a consistent approach for Federal, state, local, and tribal governments to work effectively and efficiently together to prepare for, prevent, respond to, and recover from domestic incidents, regardless of cause, size, or complexity. Joint forces conduct CBRNE CM in accordance with NIMS but maintain a distinct, independent chain of command. However, military personnel can and frequently will receive tactical direction from the on-scene commander and subordinates, especially in circumstances where small numbers of military personnel augment civilian response functions. Installation forces operating under immediate response authority stay under the control of the Service branch of the chain of command unless committed to the Federal response effort by the Secretary of Defense. Under NIMS, installation and joint forces may find themselves getting task direction from a civilian firefighter, law enforcement officer, or emergency medical technician, but this functional working relationship does not replace or circumvent the military chain of command. Key to success for joint forces conducting CBRNE CM is to establish and maintain unity of effort within the framework of NIMS while maintaining unity of command within DOD." (**JCS/DOD**, *CBRNE Consequence Management*, 2006, II-14)

National Information Exchange Model (NIEM): "The development of NIEM is a joint effort among DOJ, DHS, and subject-matter experts from the justice, public safety, law enforcement, homeland security, and private sectors. Designed by experienced practitioners, governed by

participating stakeholders, and driven by leadership from DOJ and DHS, NIEM is developing, disseminating, and supporting enterprise-wide information exchange standards and processes that enable jurisdictions to effectively share critical information in emergency situations, as well as support the day-to-day operations of agencies throughout the nation.

"To ensure the longevity and continued relevance of the HSEEP Data Exchange Standards, NED [National Exercise Division] has aligned its efforts in this area with work currently underway at NIEM. As mentioned above, NIEM evolved from a DHS and Department of Justice (DOJ) partnership. Its development was predicated on the need for these two agencies to share information quickly and accurately in areas where their business practices crossed paths, such as in cases of immigration and person screening. NIEM has since expanded to encompass seven domains, including *emergency management, infrastructure protection and intelligence,* each containing resources useful for any party needing to conduct information exchanges in these areas. Currently, a coordinated NIEM adoption process is underway throughout most DHS component agencies, with the DHS Enterprise Data Management Office (EDMO) guiding the effort. NED believes that leveraging existing NIEM products and resources, as well as participating as a stakeholder in the overarching DHS NIEM adoption process, provides value both by reducing expenditures that would be incurred by developing a proprietary data exchange standard and by providing stakeholders with access to a number of useful data exchange standard-related resources and tools. Because the HSEEP Data Exchange Standards are NIEM-conformant, stakeholders are free to reuse any of its components, as well as any other component in any of the NIEM domains, to create unique data exchanges for purposes not directly related to HSEEP and that best serve their own needs. The overall concept, therefore, is to provide flexibility and utility while saving time and effort. The NIEM website contains a number of useful, non-technical, education and outreach resources for parties interested in understanding and applying NIEM and NIEM-conformant data exchange standards, such as the HSEEP Data Exchange Standard." (**FEMA**, *NIEM Overview*, Accessed March 27)

National Information Sharing Privacy Guidelines and Principles: "The Privacy Guidelines build on a set of core principles that Federal departments and agencies must follow. Those principles require specific, uniform action and reflect basic privacy protections and best practices. Agencies must:

- Share protected information only to the extent it is terrorism information, homeland security information, or law enforcement information related to terrorism;
- Identify and review the protected information to be shared within the ISE [Information Sharing Environment];
- Enable ISE participants to determine the nature of the protected information to be shared and its legal restrictions (e.g., "this record contains individually identifiable information about a U.S. citizen");
- Assess, document, and comply with all applicable laws and policies;
- Establish data accuracy, quality, and retention procedures;
- Deploy adequate security measures to safeguard protected information;
- Implement adequate accountability, enforcement, and audit mechanisms to verify compliance;
- Establish a redress process consistent with legal authorities and mission requirements;

- Implement the guidelines through appropriate changes to business processes and systems, training, and technology;
- Make the public aware of the agency's policies and procedures as appropriate;
- Ensure agencies disclose protected information to non-Federal entities—including State, local, tribal, and foreign governments—only if the non-Federal entities provide comparable protections; and
- State, local, and tribal governments are required to designate a senior official accountable for implementation." (**White House**, *National Strategy for Information Sharing*, 2007, pp. 27-28)

National Infrastructure: "Those infrastructures essential to the functioning of the nation and whose incapacity or destruction would have a debilitating regional or national impact. National infrastructures include telecommunications, electrical power systems, gas and oil transportation and storage, water supply systems, banking and finance, transportation, emergency services, and continuity of government operations." (**DoD**, *CAAP*, 1998)

National Infrastructure Coordinating Center (NICC) DHS: "Managed by the DHS Information Analysis and Infrastructure Protection Directorate, the NICC monitors the Nation's critical infrastructure and key resources on an ongoing basis. In the event of an incident, the NICC provides a coordinating vehicle to share information with critical infrastructure and key resources information-sharing entities." (**USCG**, *IM Handbook*, 2006, Glossary 25-16)

National Infrastructure Inventory: "The inventory addresses the physical, cyber, and human elements of each asset, system, network, or function under consideration. The compilation process relies on the substantial body of previous assessments that have been completed for natural disasters, industrial accidents, and other incidents. The inventory includes basic information on the relationships, dependencies, and interdependencies between various assets, systems, networks, and functions; on service providers, such as schools and businesses, that may be of relevance to more than one sector; and on the foreign assets, systems, networks, and functions on which U.S. CI/KR may rely. The inventory also includes a cyber data framework that is used to characterize each sector's unique cyber assets, systems, networks, or functions." (**DHS,** *NIPP* 2006, pp. 31-32)

National Infrastructure Protection Plan (NIPP): "The National Infrastructure Protection Plan (NIPP) and supporting Sector-Specific Plans (SSPs) provide a coordinated approach to critical infrastructure and key resources (CI/KR) protection roles and responsibilities for federal, state, local, tribal, and private sector security partners. The NIPP sets national priorities, goals, and requirements for effective distribution of funding and resources which will help ensure that our government, economy, and public services continue in the event of a terrorist attack or other disaster. The plan is based on the following:

> Strong public-private partnerships which will foster relationships and facilitate coordination within and across CI/KR sectors.
>
> Robust multi-directional information sharing which will enhance the ability to assess risks, make prudent security investments, and take protective action.

> Risk management framework establishing processes for combining consequence, vulnerability, and threat information to produce a comprehensive, systematic, and rational assessment of national or sector risk." (**DHS,** *NIPP* 2006)

National Infrastructure Protection Plan (NIPP): "Protecting and ensuring the continuity of the critical infrastructure and key resources (CI/KR) of the United States is essential to the Nation's security, public health and safety, economic vitality, and way of life. CI/KR includes physical or virtual assets, systems, and networks so vital to the United States that the incapacity or destruction of such assets, systems, or networks would have a debilitating impact on security, national economic security, public health or safety, or any combination of those matters." (**DHS**, *National infrastructure protection Plan: Sector Overview*, May 2007)

National Infrastructure Protection Plan (NIPP) Goal: "The goal of the *NIPP* is to build a safer, more secure, and more resilient America by enhancing protection of the Nation's critical infrastructure and key resources (CIKR)." (**DHS**, *NRF*, Jan 2008, 19, fn. 15)

National Infrastructure Protection Plan (NIPP) Purpose: "The purpose of the NIPP is to "build a safer, more secure, and more resilient America by enhancing protection of the Nation's CI/KR to prevent, deter, neutralize, or mitigate the effects of deliberate efforts by terrorists to destroy, incapacitate, or exploit them; and to strengthen national preparedness, timely response, and rapid recovery in the event of an attack, natural disaster, or other emergency." (**DHS**, *National Preparedness Guidelines*, 2006, p. 14)

National Infrastructure Protection Plan (NIPP) 17 Sector-Specific Plans: "**The *NIPP* and its 17 sector-specific plans create a system for protection of critical infrastructure and key resources that includes both the public and private sectors.** It establishes protection standards and objectives developed in partnership with each of the 17 sectors, and creates consultative mechanisms, including those for sharing key threat information, with the private sector which owns or operates most of the Nation's critical infrastructure." (**DHS**, *NRF*, 2008, 72; emphasis in original) The 17 Sectors are:

- Agriculture and Food
- Defense Industrial Base
- Energy
- Public Health and Healthcare
- National Monuments and Icons
- Banking and Finance
- Drinking Water and Water Treatment Systems
- Chemical
- Commercial Facilities
- Dams
- Emergency Services
- Nuclear Reactors, Materials, and Waste
- Information Technology
- Communications
- Postal and Shipping

- Transportation Systems
- Government Facilities (**DHS**, *NIPP Sector Overview*, 2007, 2)

National Infrastructure Protection Plan (NIPP) Senior Leadership Council: "NIPP Senior Leadership Council: The NIPP Leadership Council will bring together the leadership of the federal agencies engaged in critical infrastructure protection, critical infrastructure owners and operators and Homeland Security Advisors to lead, integrate, and coordinate implementation and enhancement of the NIPP through the following activities: forging consensus on critical infrastructure protection actions, evaluating and promoting implementation of risk management-based infrastructure protection programs, information sharing, advancing collaboration within and across sectors, and evaluating and reporting on progress. The NIPP Senior Leadership Council is supported by the Cross-Government Coordinating Council and Cross-Sector Coordinating Council." (**DHS**, *ODP Information Bulletin*, No. 172, June 01, 2005)

National Infrastructure Protection Program: "The National Infrastructure Protection Plan (NIPP) provides the unifying structure for the integration of critical infrastructure and key resources (CI/KR) protection into a single national program. The NIPP provides an overall framework for programs and activities that are currently underway in the various sectors, as well as new and developing CI/KR protection efforts. This collaborative effort between the private sector; State, Territorial, local, and tribal governments; nongovernmental organizations; and the Federal Government will result in the prioritization of protection initiatives and investments across sectors. It also will ensure that resources are applied where they offer the most benefit for mitigating risk by lowering vulnerabilities, deterring threats, and minimizing the consequences of terrorist attacks and other incidents." (**DHS**, *National Infrastructure Protection Plan* (Letter of Agreement), June 30, 2006; and **DHS**, "Fact Sheet: National Infrastructure Protection Program Sector-Specific Plans," May 21, 2007)

National Infrastructure Simulation and Analysis Center (NISAC): "The National Infrastructure Simulation and Analysis Center (NISAC) is a modeling, simulation, and analysis program that prepares and shares analyses of critical infrastructure and key resources including their interdependencies, vulnerabilities, consequences of disruption, and other complexities. NISAC is under the direction of the Department of Homeland Security's (DHS) Office of Infrastructure Protection (OIP). Sandia National Laboratories (SNL) and Los Alamos National Laboratory (LANL) are the prime contractors for NISAC, integrating the two laboratories' expertise in the modeling and simulation of complex systems for evaluating national preparedness and security issues. NISAC activities include:

- Infrastructure modeling and analysis
- Decision support tools
- Knowledge management
- Fast turnaround analyses." (**Sandia National Laboratories**, *National Infrastructure Simulation and Analysis Center*, 2008)

National Institute of Allergy and Infectious Diseases: "The National Institute of Allergy and Infectious Diseases (NIAID) conducts and supports basic and applied research to better understand, treat, and ultimately prevent infectious, immunologic, and allergic diseases. For

more than 50 years, NIAID research has led to new therapies, vaccines, diagnostic tests, and other technologies that have improved the health of millions of people in the United States and around the world." (**NIAID**, *Overview*, March 1, 2005 update)

National Institute of Standards and Technology (NIST), DOC, National Earthquake Hazards Reduction Program (NEHRP) Mission: "NIST serves as NEHRP lead agency and conducts applied research 1 and development (R&D) in earthquake engineering to improve building codes and standards for new and existing buildings and infrastructure lifelines, advance seismic-resistant construction practices, develop measurement and prediction tools supporting performance-based standards, and evaluate advanced technologies. Consistent with its broader research mission, NIST research focuses on removing technical barriers, evaluating advanced technologies, and enabling innovation and competitiveness in the U.S. design and construction industry. As lead agency, NIST provides the overall direction, coordination, and support of NEHRP joint activities. The NIST Director chairs the Interagency Coordinating Committee (ICC). The NEHRP Director, a NIST employee, directs the NEHRP Secretariat, chairs a working-level Program Coordination Working Group, and serves as NEHRP point of contact with non-government groups and interests." *Strategic Plan for the National Earthquake Hazards Reduction Program Fiscal Years 2008-2012* (Draft for Public Review and Comment). NEHRP, April 2008,

National Integration Center (NIC): "Homeland Security Presidential Directive-5 (HSPD-5) required the Secretary of Homeland Security to establish a mechanism for ensuring the ongoing management and maintenance of NIMS including regular consultation with other Federal departments and agencies, State, tribal, and local stakeholders, and with the private sector and NGOs. The NIC provides strategic direction, oversight, and coordination of NIMS and supports both routine maintenance and the continuous refinement of NIMS and its components. The NIC oversees and coordinates all aspects of NIMS, including the development of compliance criteria and implementation activities at Federal, State, tribal, and local levels. It provides guidance and support to jurisdictions and emergency management/response personnel and their affiliated organizations as they adopt or, consistent with their status, are encouraged to adopt the system. The NIC also oversees and coordinates the publication of NIMS and its related products. This oversight includes the review and certification of training courses and exercise information." (**FEMA**, *NIMS* (FEMA 501/Draft), 2007, p. 8)

National Integration Center (NIC): "Over the course of the last year, the National Integration Center (NIC) has made substantial progress in its mission to integrate FEMA's goals and objectives. More importantly, the NIC in conjunction with NPD is establishing its ability to provide high-quality support to the agency and the emergency response community at large."

National Integration Center (NIC) Mission: "The National Integration Center (NIC) is responsible for developing, managing, and coordinating all homeland security training, education (external), and exercise programs, as required, to ensure the Nation is prepared to prevent, protect against, respond to, recover from, and mitigate against all hazards, natural or manmade." (**FEMA**, *National Preparedness Directorate/National Integration Center (NPD-NIC)*, slide 1)

National Interagency Civil-Military Institute (NICI): The National Interagency Civil-Military Institute (NICI), San Luis Obispo, CA, is an educational institute—funded by the Department of Defense (DOD) through the National Guard Bureau—with the mission of improving the efficiency and effectiveness of joint civilian and military initiatives. To this end, it provides education to middle- and upper-level managers from the military, law enforcement agencies, emergency management and public safety organizations, and community groups.

National Interoperability Field Operations Guide (NIFOG): "The National Interoperability Field Operations Guide (NIFOG) is a collection of technical reference material for radio technicians responsible for radios that will be used in disaster response applications. The NIFOG includes information from the National Interoperability Frequency Guide (NIFG), the instructions for use of the NIFG, and other reference material; formatted as a pocket-sized guide for radio technicians to carry with them." (**DHS**, **NIFOG** (Version 1.0), September, 2007, p. 3)

National Joint Information Center (JIC) "A national JIC is established when an incident requires Federal coordination and is expected to be of long duration (weeks or months) or when the incident affects a large area of the country. A national JIC is staffed by numerous Federal departments and/or agencies. (**FEMA**, *Basic Guidance for PIOs*, Nov 2007, p. 16)

National Joint Terrorism Task Force (NJTTF): "…we bring together people from every U.S. agency that collects and processes terrorist intelligence; we put them in one room and hook them into their own and into our FBI intelligence databases; and all of a sudden we have the universe of terrorist intelligence on the table--to share, to query, to coordinate, to answer questions, and to give direction and support to the 84 Joint Terrorism Task Forces (JTTFs) around the country that function under us. "Fusion" means that terrorist intelligence is instantly shared vertically from HQ to our JTTFs and horizontally to all NJTTF agencies." (**FBI**, *Meet the NJTTF*, July 2004)

National Levee Challenge: Levees and the FEMA Flood Map Modernization Initiative: "This report, prepared by the Interagency Levee Policy Review Committee, contains a series of recommended actions for the Federal Emergency Management Agency (FEMA) Mitigation Directorate to consider as a means of addressing the challenge of assessing the flood protection capabilities of levees and levee systems and accurately assessing the flood risk posed to citizens and property located behind those levees and levee systems. In this report, the Committee: examines and recommends changes to current FEMA levee policies, as stated in the National Flood Insurance Program regulations and FEMA guidance documents; identifies outreach and public awareness challenges related to the remapping of levee-affected areas and proposes approaches to deal with these challenges; and proposes cooperative development by FEMA and the U.S. Army Corps of Engineers of a Geographic Information System-based levee inventory." (**Interagency Levee Policy Review Committee**. *The National Levee Challenge: Levees and the FEMA Flood Map Modernization Initiative*, September 2006)

National Level Exercises (NLEs): NLEs reflect US government-wide priorities, rather than department or agency priorities or programs. Departmental and Agency exercise programs should fit into the NLE framework not the other way around.

National Levee Safety Program: "The Corps' Levee Safety Program emphasizes the role of levees in flood damage reduction to avoid loss of life and property damage. The program will help achieve three goals:
1) Reduce risk and increase public safety through an informed public, empowered to take responsibility for its safety;
2) Develop a clear national levee safety policy and standards; and
3) Maintain a sustainable flood damage reduction system that meets public safety needs.
(**USACE**, *Fact Sheet: National Levee Safety Program*. February 1, 2007, 1)

National Level Exercises (NLEs): (**FEMA**, *Statement of D. Schrader*, Oct. 3, 2007, 4)

National Logistics Coordination Forum: "This effort focuses on developing policy and operating doctrine for the national disaster logistics community in coordination with the Department of Defense (DoD) US Northern Command (USNORTHCOM). This will be a high level, transparent effort with participants including DoD, and other federal agencies, non-governmental organizations, the private sector, FEMA Regions and state and local governments. The National Logistics Coordination Forum will serve as an umbrella organization to discuss ongoing high level logistics challenges; integrated working groups will be formed to identify and develop solutions." (**FEMA**, *Logistics Management Directorate Fact Sheet*, 31Jan2008 mod.)

National Logistics Coordinator Concept: "This concept allows FEMA to tap into the resources of its partners, minimizing the need for FEMA to maintain large inventory levels of its own and thus minimizes the need to dispose of excess supplies." (**FEMA**, *Statements of William Eric Smith and Carlos J. Castillo,* July 31, 2008, p. 8)

National Military Command Center (NMCC): "The NMCC is the Nation's focal point for continuous monitoring and coordination of worldwide military operations. It directly supports combatant commanders, the Chairman of the Joint Chiefs of Staff, the Secretary of Defense, and the President in the command of U.S. Armed Forces in peacetime contingencies and war. Structured to support the President and Secretary of Defense effectively and efficiently, the Center participates in a wide variety of activities, ranging from missile warning and attack assessment to management of peacetime contingencies such as Defense Support of Civil Authorities (DSCA) activities. In conjunction with monitoring the current worldwide situation, the Center alerts the Joint Staff and other national agencies to developing crises and will initially coordinate any military response required." (**DHS**, *NRF*, 2008, 56)

National Military Strategy: "The National Military Strategy (NMS) supports the aims of the National Security Strategy (NSS) and implements the National Defense Strategy (NDS). It describes the Armed Forces' plan to achieve military objectives in the near term and provides the vision for ensuring they remain decisive in the future." (**DOD/JCS**, *The NMS of USA*, 2004, 1)

National Military Strategy of the USA in Relation to Domestic Consequence Management: "During emergencies the Armed Forces may provide military support to civil authorities in mitigating the consequences of an attack or other catastrophic event when the civilian responders are overwhelmed. Military responses under these conditions require a streamlined chain-of-

command that integrates the unique capabilities of active and reserve military components and civilian responders." (Cited in *JCS.DOD*, *CBRNE Consequence Management*, 2006, p. II-1)

National Mitigation Goal: In 1997 "FEMA established a National Mitigation Goal to be accomplished by the year 2010. The two components of the goal are (1) to substantially increase public awareness of natural hazard risk so that the public demands safer communities in which to live and work, and (2) to significantly reduce the risk of loss of life, injuries, economic costs, and destruction of natural and cultural resources that result from natural hazards. To meet the National Strategy Goal, FEMA set specific objectives for five major 'elements' of the Strategy:

- Hazard identification and risk assessment;
- Applied research and technology transfer;
- Public awareness, training, and education;
- Incentives and resources; and
- Leadership and coordination." (**FEMA**, *Multi Hazard Identification and Risk Assessment*, 1997, p. xxv) [Note: The National Mitigation Goal was discontinued shortly after FEMA was incorporated into the DHS.]

National Mitigation Strategy: "As a direct result of the disasters of the early 1990s, in particular the Midwest Floods of 1993, the U.S. Congress directed FEMA to place its highest priority on working with State and local agencies to mitigate the impacts of future natural hazard events. This marked a fundamental shift in policy: rather than placing primary emphasis on response and recovery, FEMA's focus broadened to incorporate mitigation as the foundation of emergency management…In keeping with congressional directive…FEMA…led the development of the National Mitigation Strategy. FEMA derived 10 fundamental principles for the framework and objectives of the National Mitigation Strategy.

1. Risk reduction measures ensure long-term economic success for the community as a whole rather than short-term benefits for special interests.
2. Risk reduction measures for one natural hazard must be compatible with risk reduction measures for other natural hazards.
3. Risk reduction measures must be evaluated to achieve the best mix for a given location.
4. Risk reduction measures for natural hazards must be compatible with risk reduction measures for technological hazards and vice versa.
5. All mitigation is local.
6. Disaster costs and the impacts of natural hazards can be reduced by emphasizing pro-active mitigation before emergency response; both pre-disaster (preventive) and post-disaster (corrective) mitigation is needed.
7. Hazard identification and risk assessment are the cornerstones of mitigation.
8. Building new Federal-State-local partnerships and public-private partnerships is the most effective means of implementing measures to reduce the impacts of natural hazards.
9. Those who knowingly choose to assume greater risk must accept responsibility for that choice.
10. Risk reduction measures for natural hazards must be compatible with the protection of natural and cultural resources." (**FEMA**, *Multi Hazard Identification and Risk Assessment: A Cornerstone of the National Mitigation Strategy*, 1997, pp. xxii and xxv)

[The National Mitigation Strategy was discontinued shortly after the incorporation of FEMA into the DHS]

National Mutual Aid and Resource Management Initiative: "The National Mutual Aid and Resource Management Initiative supports the National Incident Management System (NIMS) by establishing a comprehensive, integrated national mutual aid and resource management system that provides the basis to type, order, and track all (Federal, State, and local) response assets." (**FEMA**, *Resource Definitions: 120 Resources*, September 2004, p. 6)

National Nuclear Detection Policy: "It is the policy of the United States to continue to…

- Develop, deploy and enhance national nuclear and radiological detection capabilities to prevent illicit use of nuclear devices or materials
- Enhance the effective integration of nuclear and radiological detection capabilities across Federal, State, local and tribal governments, and the private sector, for a well-managed, coordinated response
- Advance the science of nuclear and radiological detection through an aggressive, evolutionary and transformational program of research and development in detection technologies." (**DHS/DNDO**, *DNDO Overview*, April 20, 2006, slide 5)

National Nuclear Security Administration (NNSA): "Established by Congress in 2000, NNSA is a semi-autonomous agency within the U.S. Department of Energy responsible for enhancing national security through the military application of nuclear science. NNSA maintains and enhances the safety, security, reliability and performance of the U.S. nuclear weapons stockpile without nuclear testing; works to reduce global danger from weapons of mass destruction; provides the U.S. Navy with safe and effective nuclear propulsion; and responds to nuclear and radiological emergencies in the United States and abroad." (**DOE**, *About NNSA*)

National Oil and Hazardous Substances Pollution Contingency Plan (NCP): "…40 C.F.R. § 300 (2006), provides for the coordinated and integrated response by the Federal Government, as well as State and local governments, to prevent, minimize, or mitigate a threat to public health or welfare posed by discharges of oil and releases of hazardous substances, pollutants, and contaminants." (**DHS**, *National Response Framework List of Authorities and References* (Draft), September 10, 2007, p. 8)

National Oil and Hazardous Substances Pollution Contingency Plan (NCP): Commonly referred to as the National Contingency Plan, or NCP. "The first National Contingency Plan was developed and published in 1968 in response to a massive oil spill from the oil tanker *Torrey Canyon* off the coast of England the year before…. To avoid the problems faced by response officials involved in this incident, U.S. officials developed a coordinated approach to cope with potential spills in U.S. waters. The 1968 plan provided the first comprehensive system of accident reporting, spill containment, and cleanup, and established a response headquarters, a national reaction team, and regional reaction teams… Congress has broadened the scope of the National Contingency Plan over the years. As required by the Clean Water Act of 1972, the NCP was revised the following year to include a framework for responding to hazardous substance spills as well as oil discharges. Following the passage of Superfund legislation in 1980, the NCP

was broadened to cover releases at hazardous waste sites requiring emergency removal actions. Over the years, additional revisions have been made to the NCP to keep pace with the enactment of legislation. The latest revisions to the NCP were finalized in 1994 to reflect the oil spill provisions of the Oil Pollution Act of 1990." (**EPA**, *Overview of the National Contingency Plan*. March 6, 2006 update)

National Operations Center (NOC). See Department of Homeland Security, NOC.

National Plan For Civil Defense Against Enemy Attack: A national plan for catastrophic disaster, preceding the National Catastrophic Earthquake Plan, the Federal Response Plan, National Response Plan, and National Response Framework. "Expansion of the Federal part of the *National Plan For Civil Defense Against Enemy Attack* was begun with particular emphasis on use of Federal resources and incorporation of the principles of *Basic Responsibililities Paper* [outlined roles of DOD, ODM, and FCDA in national emergency] as the basis for a Federal operations plan." (**FCDA**, *1957 Annual Report*, 1958, p. 1)

National Plan For Civil Defense and Defense Mobilization (1958): Replaced the National Plan for Civil Defense and was promulgated by President Eisenhower in October 1958. "The National Plan established nonmilitary courses of action to deter aggression, and in the event of aggression, to enable the Nation to survive, recover, and win. It defined the role required of the Federal Government, the States and their political subdivisions, and of families and individuals to attain this objective…. The 40 elements of the National Plan are being implemented by developing appropriate operational annexes providing for its detailed application by governments, families, and individuals. Some annexes have been completed and are in effect, e.g., Planning Basis, Individual Actin, Organization for Civil Defense Mobilization, National Shelter Plan, Role of the Military, Preparations for Continuity of Government, and Disaster Services. The remaining annexes are in the final stages of development." (**OCDM**, *Annual Report 1959*, 3)

"The National Plan states that the Federal Government will continuously assess the ability of the national economy to meet all mobilization and civil defense requirements, aned will develop programs for the emergency control of the economy." (Ibid, p. 35)

"The National Plan for Civil Defense and Defense Mobilization – With its supporting annexes, the National Plan has guided the coordinated planning by governments at all levels, industry, families and individuals. Each State, 240 metropolitan areas within the States, and approximately 50 percent of the counties have plans supporting it." (**OCDM**, *Annual Report 1960*, 1)

National Plan For Civil Defense and Defense Mobilization Annexes:

- Annex 1 – Planning Basis (OCDM, *National Plan*, 1958, p. vii)
- Annex 2 – Individual Action (Ibid)
- Annex 3 – Organization for Civil Defense and Defense Mobilization (Ibid)
- Annex 4 – Authorities for Civil Defense and Defense Mobilization (Ibid)
- Annex 5 – Federal Delegations and Assignments (Ibid)
- Annex 6 – Federal Emergency Plans and Procedures ((OCDM, *Annual Report 1961*, 5)

- Annex 7 – Role of the Military (OCDM, *National Plan*, 1958, p. vii)
- Annex 8 – Preparations for Continuity of Government (Ibid)
- Annex 9 – Public Information (Ibid)
- Annex 10 – National Shelter Plan (Ibid)
- Annex 11 – Protection of Essential Facilities (Ibid)
- Annex 12 – Controlled Movement [Later changed to "Directed"] (Ibid)
- Annex 13 – Warning (Ibid)
- Annex 14 – Damage Assessment (Ibid)
- Annex 15 – Communications (OCDM, *Annual Report 1960*, p. 44)
- Annex 16 – Maintenace of Law and Order (Ibid)
- Annex 17 – Disaster Services (Ibid)
- Annex 18 – National Health Plan (OCDM, *Annual Report 1960*, p. 26)
- Annex 19 – Emergency Welfare Annex (OCDM, *Annual Report 1961*, 28)
- Annex 20 – Registration and Information (OCDM, *National Plan*, 1958, p. vii)
- Annex 21 – National Fire Protection [Defense] Plan (OCDM, *Annual Report 1961*, 31)
- Annex 22 – Clandestine and Unexploded Ordnance Defense (OCDM, *National Plan*, 1959, vii)
- Annex 23 – National Radiological Defense Plan (OCDM, *Annual Report 1961*, 39)
- Annex 24 – National Biological and Chemical Warfare Defense Plan (OCDM, *Annual Report 1961*, 42)
- Annex 25 – Management of Essential Resources (OCDM, *National Plan*, 1959, vii)
- Annex 26 – Protection and Continuity of the National Industrial Plant. (Ibid)
- Annex 27 – Emergency Economic Stabilization Plan (OCDM, *Annual Report 1960*, 43)
- Annex 28 – Management of Emergency Production. (OCDM, *National Plan*, p. vii)
- Annex 29 – Emergency Distribution and Consumption Controls. (Ibid)
- Annex 30 – National Manpower Plan (OCDM, *Annual Report 1959*, 37)
- Annex 31 – National Food Plan (OCDM, *Annual Report 1959*, 31)
- Annex 32 – National Water Plan (OCDM, *Annual Report 1960*, p. 39)
- Annex 33 – National Energy and Minerals Plan (OCDM, *Annual Report 1959*, 38)
- Annex 34 – National Transportation Plan (OCDM, *Annual Report 1959*, 40)
- Annex 35 – Emergency Administration of Essential Facililties (OCDM, *National Plan*, vii)
- Annex 36 – Research and Development. (Ibid)
- Annex 37 – Training and Education (Ibid)
- Annex 38 – Federal Assistance (Ibid)
- Annex 39 – Review, Tests and Inspection (Ibid)
- Annex 40 – Natural Disaster Manual (Ibid)
- Annex 41 – Summary of Annexes (Ibid)
- Annex 42 – National Emergency Housing Plan (OCDM, *Annual Report 1960*, p. 42)

National Plan For Civil Defense and Defense Mobilization Appendixes:

- Procedures for Warning Points (NP-13-1)
- Frequency Allocation Plan for RACES (NP-15-1)
- Preparation for Explosive Ordnance Reconnaisance (NP-22-1)

- Health Manpower (NP-18-1)
- Radiological Defense Requirements for Monitoring Stations and Personnel (NP-23-1)
- Guidance on Priority Emergency Use of Resources (NP-25-1)

National Plan for Telecommunications Support in Non-Wartime Emergencies: "The National Plan for Telecommunications Support in Non-Wartime Emergencies provides procedures for planning and using National telecommunications assets and resources in support of non-wartime emergencies, including those covered by the Disaster Relief Act of 1974, in Presidentially declared Emergencies and Major Disasters, Extraordinary Situations, and other emergencies." (**47 CFR Ch. II (10–1–05 Edition,** at 202.1)

National Plan Review: (See "Nationwide Plan Review")

National Planning and Execution System (NPES): "Effective planning is the '*center of gravity*' for executing a coordinated Federal response to a national domestic incident. Homeland Security Presidential Directive (HSPD)-5, directed the development of a National Incident Management System (NIMS) and a National Response Plan (NRP) to align Federal coordination structures, capabilities, and resources into a unified, all-discipline, and all-hazards approach to domestic incident management. Subsequently, the Homeland Security Council published *The Federal Response to Hurricane Katrina: Lessons Learned* in February 2006.[89] This publication provided a series of recommendations, including the requirement to develop and resource a national planning and execution system. The Department of Homeland Security National Planning and Execution System (NPES) is the first step toward satisfying that requirement."[90]

"The NPES is similar to the Department of Defense (DOD) Joint Operations Planning and Execution System (JOPES) and emerging Adaptive Planning Process (AP). It is designed to facilitate intra-Departmental and interagency planning to support current and emerging DHS mission requirements. (**DHS**, 2007)

[Note: By early January 2008 the NPES had morphed into the IPS (Integrated Planning System)]

National Planning and Execution System (NPES): "The second recommendation [White House Katrina lessons learned report] identified the need for a federal planning process to unify the planning efforts that occur across the interagency. DHS addressed this recommendation through its development of the National Planning and Execution System (NPES) which is a formal curriculum based planning process used by the IMPT to build interagency contingency plans. OPS leadership recognized that the success or failure of the IMPT would hinge largely on its ability to develop a planning process that could coordinate the efforts of this interagency group and facilitate the development of a shared planning culture across the federal government. Prior to NPES, few federal departments and agencies adhered to a formal planning process that

---

[89] P. 89, White House. *The Federal Response to Hurricane Katrina – Lessons Learned*. Washington, DC: The White House, Townsend, Francis Fragos, Assistant to the President for Homeland Security and Counterterrorism, February. 2006. At: http://www.whitehouse.gov/reports/katrina-lessons-learned/

[90] According to a November 29, 2007 "Interagency Planning Workshop" slide presentation (#16) the Incident Management Planning Team "publishes" the NPES in September 2006.

organized the operational planning efforts within their respective departments. To achieve this goal, OPS created NPES, which integrates current and emerging interagency planning "best practices," is consistent with the NRP, and adheres to the core concepts and terminology addressed in NIMS. (**DHS**, *Statement of Frank DiFalco, Director of the National Operations Center, OOC*, June 20, 2007, pp. 5-6)

National Planning and Execution System (NPES): NPES "…is a five phase National level planning process developed to support the Secretary of Homeland Security in his role as the principal Federal official for domestic incident management." (DHS, *Statement of Roger Rufe, Director of the Office of Operations Coordination*, September 11, 2007, p. 5)

National Planning and Execution System (NPES): "DHS addressed the need for a federal planning process through its development of the National Planning and Execution System (NPES) – a formal curriculum-based process used by the IMPT [Interagency Incident Management Planning Team, DHS] to build its national level interagency contingency plans. DHS leadership recognized that the success or failure of the IMPT would hinge largely on its ability to develop a planning process that could coordinate the efforts of this interagency group and facilitate the development of a shared planning methodology across the federal government. In order to achieve this goal, the planning process development team within OPS [Office of Operations Coordination, DHS] sought to develop a process that was consistent with the core concepts and terminology established in the National Incident Management System (NIMS) and the National Response Plan (NRP). In addition, DHS OPS personnel recognized that the planning process they developed would be most effective if it integrated current and emerging planning 'best practices.' This effort required synchronization with our partners at DoD.

"Prior to the development of NPES, few federal departments and agencies adhered to a formal planning process that organized the operational planning efforts within their respective departments. One significant exception was DoD, which had long used formal planning processes to conduct operations within the branches of the military. For that reason, NPES was designed to be specifically compatible with the Joint Planning and Execution System (JOPES) that DoD uses to create military plans for circumstances requiring different branches of the Armed Forces to conduct joint operations.

"NPES was converted to a curriculum that was taught to each member of the IMPT. The feedback from this training has been overwhelmingly positive and has resulted in numerous requests by interagency members that OPS offer this training to others within their departments and agencies. In addition, many State and local governments have requested copies of the NPES and related training. As a result of this response, DHS has actively engaged in promoting and sharing NPES throughout the interagency. Over the past 10 months, the IMPT has trained over 500 interagency planners on the NPES process… The DHS Office of the Chief Learning Officer and the Center for Domestic Preparedness are currently working with the IMPT to develop an accredited NPES Program of Instruction. By formalizing the instruction and subsequently offering it at various accredited institutions, the NPES training will become available to a greater number of planners, thereby advancing its adoption throughout the interagency. DoD has been a particularly vocal supporter of DHS's effort to develop NPES as a means to advance a shared planning culture throughout the interagency. Indicative of this support are efforts by DHS's

Chief Learning Officer and DoD's National Defense University to offer an NPES course to military personnel through DoD's vast university network." (**DHS**, *Statement of Rufe*, 2007)

National Planning and Execution System Planning Process: NPES uses the Incident Decision Making Process (IDMP), a five phase – nine step process:

- Phase 1 – Understand the Situation
  - Step 1: Mission Identification
    - Staff Alert Notification; Staff Preparation; Initial Mission Assessment
    - Issue Initial Planning Guidance; Issue Alert Notification
- Phase 2 – Determine Objectives and Strategies
  - Step 2: Mission Analysis
    - Analyze Higher Echelon Guidance/Direction
    - Conduct Information Preparation of the Incident
    - Determine Specified, Implied, and Essential tasks; Review Available Assets
    - Determine Constraints; Identify Critical Facts and Assumptions
    - Conduct Risk Assessment
    - Determine Initial Senior Leader's Critical Information Requirements (CIRs)
    - Determine Initial Reconnaissance Requirements; Plan Use of Available Time
    - Write the restated mission; Conduct the Mission Analysis Briefing
    - Approve the Restated Mission; Issue the Senior Leader's Intent
    - Issue the Senior Leader's Guidance (COA/Priority, CIRs, Recon, Risk, & LE)
    - Issue a Planning Order; Review Facts and Assumptions
  - Step 3: Course of Action Development
    - Analyze Threat/Friendly Capabilities; Generate Options
    - Array Incident Response Capabilities; Develop Sequence of Response
    - Task Organize Capabilities (Resources); Prepare COA Statement & Sketches
- Phase 3 – Plan Development
  - Step 4: Course of Action Analysis (War-game)
    - Gather the Tools; List all Friendly Forces; List Assumptions
    - List Known Critical Events and Decision Points
    - Determine Evaluation Criteria; Select War-game Method (four basic types)
    - Select Method to Record & Display Results
    - War-game COA and Display Results -- IMPT members utilize 'Action-Reaction-Counteraction' cycle for each sequence
  - Step 5: Course of Action Comparison
    - Staff Analysis; Incident COA Decision Matrix;
    - Incident COA Decision Briefing
  - Step 6: Course of Action Approval
    - Senior leader approves COA, directs publication of plan, or directs staff to start over -- Product: Synchronization Matrix
    - After senior leader approval – the designated planning lead will organize the staff to publish the order -- Draft CONPLAN or OPLAN; Planning Order
- Phase 4 – Plan Preparation
  - Step 7: Plans and Orders Preparation
    - Senior Leader Review of Plan; DHS Component Confirmation Briefings

    - Step 8: Rehearsal/Training
        - Organization conducts rehearsal of CONPLAN or OPLAN
- Phase 5 – Plan Refinement
    - Step 9: Plan Refinement/Revision
        - Execution – When Directed or Periodic Update; Assessment

(**DHS**, *Interagency Planning Workshop*, November 29, 2007, slides 4, 8, 34-42)

National Planning Scenario: 'The term 'National Planning Scenario' means an event or threat scenario appropriate for national planning by and among all levels and jurisdictions of government, and in coordination with private, non-profit, and volunteer organizations." (**White House**, *Annex I "National Planning" to HSPD-8*, December 2007, p. 1)

National Planning Scenarios (15): "The Federal interagency community has developed 15 all-hazards planning scenarios (the National Planning Scenarios or Scenarios) for use in national, Federal, State, and local homeland security preparedness activities. The Scenarios are planning tools and are representative of the range of potential terrorist attacks and natural disasters and the related impacts that face our nation. The objective was to develop a *minimum number* of *credible* scenarios in order to establish the *range of response requirements* to facilitate preparedness planning." (**White House**, *National Planning Scenarios* (21.3 Final Draft), March 2006, p. ii)

National Planning Scenarios (15): "While preparedness applies across the all-hazards spectrum, the 2002 National Strategy for Homeland Security attaches special emphasis to preparing for catastrophic threats with "the greatest risk of mass casualties, massive property loss, and immense social disruption." To illustrate the potential scope, magnitude, and complexity of a range of major events, the Homeland Security Council—in partnership with the Department of Homeland Security (DHS), other Federal departments and agencies, and State, local, tribal, and territorial governments—developed the National Planning Scenarios. The 15 Scenarios include terrorist attacks, major disasters, and other emergencies…. Planners are not precluded from developing their own scenarios to supplement the National Planning Scenarios." (**DHS**, *National Preparedness Guidelines, Appendix B*, 2007, p. 31)

National Planning Scenarios (15): (**DHS,** *National Preparedness Guidelines, Appendix* B, 2007, p. 31)

Improvised Nuclear Devise	Aerosol Anthrax	Pandemic Influenza
Toxic Industrial Chemicals	Blister Agent	Chlorine Tank Explosion
Radiological Dispersal Device	Nerve Agent	Improvised Explosive Device
Foreign Animal Disease	Food Contamination	Cyber attack
Plague	Major Hurricane	Major Earthquake

National Planning Scenarios (Sets):

1) **Explosives Attack**
2) **Nuclear Attack**
3) **Radiological Attack**
4) **Biological Attack**
5) **Chemical Attack**

6) **Natural Disaster**
7) **Cyber Attack**
8) **Pandemic Influenza** (**DHS**, *NRF*, 2008, 75)

National Planning Scenarios (15): "The *15 National Planning Scenarios*…collectively depict a diverse set of high-consequence threat scenarios regarding both potential terrorist attacks and natural disasters. Collectively, these scenarios are designed to focus contingency planning for homeland security preparedness work at all levels of government and with the private sector. The 15 scenarios form the basis for coordinated Federal planning, training and exercises." (**DHS**, *National Response Framework Comment Draft*, 2007, p. 58)

National Planning Scenarios (15): "…the Federal planning structure calls for three types of plans for each of the 15 National Planning Scenarios: (1) a *DHS Strategic Guidance Statement* and *Strategic Capabilities Plan* that together define the broad national priorities and capabilities required to prevent, protect against, respond to and recover from domestic incidents; (2) a *National-Level Interagency Concept Plan* (CONPLAN) that integrates the operational activities of the Federal interagency into a single strategic scenario plan to achieve the objectives described in the strategic guidance statement and strategic capabilities plan; and (3) *Federal Department and Agency Operations Plans* (OPLANs) developed by and for each Federal department or agency depicting specifically how the organization will fulfill the requirements of the pertinent CONPLAN." (**DHS**, *National Response Framework Draft*, 2007, 71; **DHS**, *NRF*, 2008, 73))

National Planning Scenarios: "**The National Planning Scenarios are the focus of Federal planning efforts.** They represent examples of the gravest dangers facing the United States **and have been accorded the highest priority for Federal planning**." (**DHS**, *NRF*, 2008, 73; emphasis in original)

National Planning Scenarios: "**SEC. 645. NATIONAL PLANNING SCENARIOS.** (a) IN GENERAL.—The Administrator, in coordination with the heads of appropriate Federal agencies and the National Advisory Council, may develop planning scenarios to reflect the relative risk requirements presented by all hazards, including natural disasters, acts of terrorism, and other man-made disasters, in order to provide the foundation for the flexible and adaptive development of target capabilities and the identification of target capability levels to meet the national preparedness goal. (b) DEVELOPMENT.—In developing, revising, and replacing national planning scenarios, the Administrator shall ensure that the scenarios— (1) reflect the relative risk of all hazards and illustrate the potential scope, magnitude, and complexity of a broad range of representative hazards; and (2) provide the minimum number of representative scenarios necessary to identify and define the tasks and target capabilities required to respond to all hazards." (**Post-Katrina Emergency Management Reform Act of 2006**, p. 1425)

National Policy on Shelters (1958): "A 5-point National Policy on Shelters was announced by the Administrator on May 7, 1958. The policy, which directly supported the Radiological Defense Porgram, placed joint responsibility for fallout protection on the Federal Government and the American people. The policy was based on the recognitionn that, in the event of nuclear attack, 'fallout shelters offer the best single nonmilitary defense measure for the protection of the greatest number of our people." (**FCDA**, *Annual Report 1958*, p. 7)

National Preparedness: "National Preparedness involves a continuous cycle of activity to develop the elements (e.g., plans, procedures, policies, training, and equipment) necessary to maximize the capability to prevent, protect against, respond to, and recover from domestic incidents, especially major events that require coordination among an appropriate combination of Federal, State, local, tribal, private sector, and non-governmental entities, in order to minimize the impact on lives, property, and the economy." (**DHS**, *Interim National Preparedness Goal -- Homeland Security Presidential Directive 8: "National Preparedness."* March 2005)

National Preparedness and Response Authority: The entity Senators Collins and Lieberman proposed in 2006 to replace FEMA within DHS through combining FEMA response responsibilities with the preparedness responsibilities removed from FEMA in 2005. (**Collins**, "Opening Statement, Hearing on 'National Emergency Management: Where Does FEMA Belong?'" 8 June 2006, p. 2)

National Preparedness Architecture: "A great deal has been accomplished in developing a rigorous national preparedness architecture that enables all levels of government to successfully plan for response operations. These efforts have yielded

- the *National Preparedness Guidelines*;
- the *National Infrastructure Protection Plan (NIPP)* and 17 sector-specific plans to protect critical infrastructure;
- the *National Incident Management System (NIMS)*;
- National Continuity policies and directives;
- a coordinated National Exercise Schedule; and
- support through an extensive portfolio of grant programs." (**DHS**, *NRF*, 2008, 72)

National Preparedness Framework Four Mission Areas: "The Goal [NPG] provides a common framework for a systems-based approach to build, sustain and improve national preparedness for a broad range of threats and hazards. The Goal and other source documents define the mission areas of this framework as follows:

> **Prevent:** Actions to avoid an incident or to intervene or stop an incident from occurring. Prevention involves actions taken to protect lives and property. It involves applying intelligence and other information to a range of activities that may include such countermeasures as deterrence operations; heightened inspections; improved surveillance and security operations; investigations to determine the full nature and source of the threat; public health and agricultural surveillance and testing processes; immunizations, isolation, or quarantine; and, as appropriate, specific law enforcement operations aimed at deterring, preempting, interdicting, or disrupting illegal activity and apprehending potential perpetrators and bringing them to justice (Source—NIMS, March 2004).
>
> **Protect:** Actions to reduce the vulnerability of critical infrastructure or key resources in order to deter, mitigate, or neutralize terrorist attacks, major disasters, and other emergencies (Source—HSPD 7, December 2003). It requires coordinated action on the part of federal, state, and local governments; the private

sector; and concerned citizens across the country. Protection also includes: continuity of government and operations planning; awareness elevation and understanding of threats and vulnerabilities to their critical facilities, systems, and functions; identification and promotion of effective sector-specific protection practices and methodologies; and expansion of voluntary security-related information sharing among private entities within the sector, as well as between government and private entities. (Source – The National Strategy For The Physical Protection of Critical Infrastructures and Key Assets, February 2003)

Respond: Activities that address the short-term, direct effects of an incident. Response includes immediate actions to save lives, protect property, and meet basic human needs. Response also includes the execution of emergency operations plans and of mitigation activities designed to limit the loss of life, personal injury, property damage, and other unfavorable outcomes. As indicated by the situation, response activities include applying intelligence and other information to lessen the effects or consequences of an incident; increased security operations; continuing investigations into nature and source of the threat; ongoing public health and agricultural surveillance and testing processes; immunizations, isolation, or quarantine; and specific law enforcement operations aimed at preempting, interdicting, or disrupting illegal activity, and apprehending actual perpetrators and bringing them to justice (Source—NIMS, March 2004).

Recover: Activities that include the development, coordination, and execution of service- and site-restoration plans; the reconstitution of government operations and services; individual, private- sector, nongovernmental, and public-assistance programs to provide housing and to promote restoration; long-term care and treatment of affected persons; additional measures for social, political, environmental, and economic restoration; evaluation of the incident to identify lessons learned; post-incident reporting; and development of initiatives to mitigate the effects of future incidents (Source—NIMS, March 2004)." (**DHS/ODP**, *State and Urban Area Homeland Security Strategy: Guidelines on Aligning Strategies with the NPG*, 2005, pp. 3-4)

National Preparedness Goal (NPG): The President directed the development of a National Preparedness Goal (or Goal) in Homeland Security Presidential Directive (HSPD)-8. The Goal reorients how the Federal government proposes to strengthen the preparedness of the United States to prevent, protect against, respond to, and recover from terrorist attacks, major disasters, and other emergencies. The Goal establishes a vision, capabilities, and priorities for national preparedness. It should be utilized in conjunction with the three capabilities-based planning tools referenced in the Goal: the National Planning Scenarios, Universal Task List (UTL), and Target Capabilities List (TCL). Collectively, they identify key requirements that can help guide domestic all-hazards preparedness efforts. (**DHS**, *NPG*, December 2005 Draft, Preface)

National Preparedness Goal (NPG): "A requirement of HSPD-8 to define "standards for preparedness assessments and strategies, and a system for assessing the Nation's overall preparedness to respond to major events, especially those involving acts of terrorism." The Goal establishes measurable priorities, targets, and a common approach to developing needed capabilities. The Goal includes seven priorities for national preparedness: two overarching

priorities and five priorities to build specific capabilities. The overarching priorities of the National Preparedness Goal are to:

Implement the National Incident Management System and National Response Plan
Expand regional collaboration, and
Implement the Interim National Infrastructure Protection Plan.

The priorities for specific capabilities are to:

Strengthen information sharing and collaboration capabilities;
Strengthen interoperable communications capabilities;
Strengthen chemical, biological, radiation, nuclear, and explosive weapons (CBRNE) detection, response, and decontamination capabilities; and
Strengthen medical surge and mass prophylaxis capabilities."
(**HSC**, *NCPIP*, 2007, 66; See also, **DHS**, *Interim NPG*, 2005)

National Preparedness Goal Vision: "To engage Federal, State, local, and tribal entities, their private and non-governmental partners, and the general public to achieve and sustain risk-based target levels of capability to prevent, protect against, respond to, and recover from major events in order to minimize the impact on lives, property, and the economy." (**DHS**, *NPG*, December 2005 Draft, p. 1)

National Preparedness Goal – Change to National Preparedness Guidelines: "*Has the National Preparedness Goal been changed to the National Preparedness Guidelines?*
Yes. This is a change in title is intended to more accurately describe this important guidance. The National Preparedness Guidelines, released in September 2007, support the requirements of Homeland Security Presidential Directive - 8 and replace the interim National Preparedness Goal. The Guidelines maintain the following preparedness tools: 1) National Preparedness Vision; 2) National Planning Scenarios; 3) Universal Task List; and 4) Target Capabilities List." (**DHS**, *NRF FAQs*, Jan 2008, 6)

National Preparedness Guidelines: "The National Preparedness Guidelines (*Guidelines*) are formally established upon issuance and supersede the Interim National Preparedness Goal issued on March 31, 2005. The *Guidelines* provide an overarching vision, tools, and priorities to shape national preparedness. The *Guidelines* do not include an implementation plan; implementation will occur over time through a wide range of Federal, State, local, tribal, and territorial preparedness programs and activities. For example, Federal program offices will develop detailed plans that describe how their programs support *Guidelines* implementation in consultation with their stakeholders. Those details must be reflected in annual program guidance, in the form of measurable objectives and requirements. DHS will monitor those efforts and advise program offices and DHS leadership on progress and opportunities to improve synchronization. Implementation and feedback will inform future refinement of the *Guidelines*." (**DHS**, *National Preparedness Guidelines, Appendix A, Letter of Instruction*, p. 25)

National Preparedness Guidelines, Four Critical Elements: "The *National Preparedness Guidelines* package…is comprised of four critical elements:

• The ***National Preparedness Vision***, which provides a concise statement of the core preparedness goal for the nation.

• The ***15 National Planning Scenarios***, which collectively depict a diverse set of high-consequence threat scenarios regarding both potential terrorist attacks and natural disasters. Collectively, these scenarios are designed to focus contingency planning for homeland security preparedness work at all levels of government and with the private sector. The 15 scenarios form the basis for coordinated Federal planning, training and exercises.

• The ***Universal Task List***, which is a menu of some 1,600 unique tasks that can facilitate efforts to prevent, protect against, respond to and recover from the major events that are represented by the National Planning Scenarios. It presents a common vocabulary and identifies key tasks that support development of essential capabilities among organizations at all levels. Of course, no entity will perform every task. Instead, this task list was used to assist in creating the Target Capabilities List. It is included in the *Guidelines* package as a reference for interested jurisdictions.

• The ***Target Capabilities List***, which defines 37 specific capabilities that communities, the private sector and all levels of government should possess in order to respond effectively to disasters." (**DHS**, *NRF Comment Draft*, 2007, p. 68; note that *2008 NRF* drops specified numbers such as 15 scenarios, 1,600 tasks, and 37 TCL capabilities (72))

National Preparedness Guidelines, Lead Agency Implementation Requirements: "The National Preparedness Guidelines (*Guidelines*) are formally established upon issuance and supersede the Interim National Preparedness Goal issued on March 31, 2005. The *Guidelines* provide an overarching vision, tools, and priorities to shape national preparedness. The *Guidelines* do not include an implementation plan; implementation will occur over time through a wide range of Federal, State, local, tribal, and territorial preparedness programs and activities. For example, Federal program offices will develop detailed plans that describe how their programs support *Guidelines* implementation in consultation with their stakeholders. Those details must be reflected in annual program guidance, in the form of measurable objectives and requirements. DHS will monitor those efforts and advise program offices and DHS leadership on progress and opportunities to improve synchronization. Implementation and feedback will inform future refinement of the *Guidelines*." (**DHS**, *National Preparedness Guidelines, Appendix A, Letter of Instruction*, 2007, pp. 25-26)

National Preparedness Guidelines, Purposes:

- "Organize and synchronize national (including Federal, State, local, tribal, and territorial) efforts to strengthen national preparedness;
- Guide national investments in national preparedness;
- Incorporate lessons learned from past disasters into national preparedness priorities;
- Facilitate a capability-based and risk-based investment planning process; and
  Establish readiness metrics to measure progress and a system for assessing the Nation's overall preparedness capability to respond to major events, especially those involving acts of terrorism. (**DHS**, *National Preparedness Guidelines*, September 13, 2007, p.1)

National Preparedness Guidelines Vision: "The vision for the *National Preparedness Guidelines* is:

> **A NATION PREPARED with coordinated capabilities to prevent, protect against, respond to, and recover from all hazards in a way that balances risk with resources and need.**

This vision is far-reaching. It recognizes that preparedness requires a coordinated national effort involving every level of government, as well as the private sector, nongovernmental organizations, and individual citizens. It addresses capabilities-based preparedness for the full range of homeland security missions, from prevention through recovery. States, communities, and the Federal Government have worked together for decades to manage natural disasters and technological emergencies, particularly with regard to response and recovery. However, they have far less experience with terrorist attacks, particularly with regard to prevention and protection. The *Guidelines* address all hazards and place heavy emphasis on events at the catastrophic end of the risk continuum, especially terrorist attacks, which would require rapid

> and coordinated national action. The vision acknowledges that the Nation cannot achieve total preparedness for every possible contingency and that no two jurisdictions possess identical capability needs. We must weigh the relative risk of catastrophic events when determining the resources available to address each contingency and the unique needs of each community, determine how to best address needs in light of the risks, and thereby achieve optimal and reasonable levels of preparedness." (**DHS**, *National Preparedness Guidelines*, September 13, 2007, p.1-2)

National Preparedness Integration Program (NPIP): "Through the NPIP, FEMA will integrate and synchronize strategic tools, including the National Incident Management System, National Response Plan, National Infrastructure Plan and the National Preparedness Goal into a national operational capability. The NPIP will ensure development of preparedness processes that foster harmonized day-to-day routine interaction of disciplines, organizations, levels of government and our citizens. NPIP's capability requires partnerships at the headquarters level, among those in the field and on the front line." (**FEMA**, *Vision for New FEMA*, 12Dec06, p. 24)

National Preparedness Network (PREPnet): "The Preparedness Network (PREPnet) is a satellite-based distance learning system used by…[FEMA/National Emergency Training Center] to bring interactive training programs into virtually any community nationwide." (**FEMA,** *About the National Preparedness Network*)

National Preparedness Planning, Standardized Process: "It is the policy of the United States Government to enhance the preparedness of the Nation by developing and maintaining a standardized approach to national planning to integrate and effect policy and operationalized objectives to prevent, protect against, respond to, and recover from all hazards, and comprises: (a) a standardized Federal planning process; (b) national planning doctrine; (c) resourced operational and tactical planning capabilities at each Federal department and agency with a role in homeland security; (d) strategic guidance, strategic plans, concepts of operations, and

operations plans and as appropriate, tactical plans; and (e) a system for integrating plans among all levels of government." (**White House**, *Annex I "National Planning" to HSPD-8*, 2007, p. 2)

National Preparedness Priorities (Eight) and Associated Capabilities:

National Priority	Associated Capabilities
Expand Regional Collaboration	Multiple capabilities
Implement the National Incident Management System and National Response Plan	Multiple capabilities
Implement the National Infrastructure Protection Plan	Multiple capabilities
Strengthen Information Sharing and Collaboration Capabilities	Intelligence/Information Sharing and Dissemination Counter-Terror Investigations and Law Enforcement
Strengthen Interoperable and Operable Communications Capabilities	Communications Emergency Public Information and Warning
Strengthen CBRNE Detection, Response, and Decontamination Capabilities	CBRNE Detection Explosive Device Response Operations WMD/Hazardous Materials Response and Decontamination
Strengthen Medical Surge and Mass Prophylaxis Capabilities	Medical Surge Mass Prophylaxis
Strengthen Planning and Citizen Preparedness Capabilities	Planning Citizen Evacuation and Shelter-in-Place Mass Care (Sheltering, Feeding, and Related Services) Community Preparedness and Participation

(**DHS**, *National Preparedness Guidelines*, September 2007, p. 11)

National Preparedness System (NPS): "Implementing a common, shared approach to achieving National preparedness requires the Nation to align its programs and efforts in support of the Goal [NPG]. Alignment can best be achieved through the application of a systems-based approach, utilizing capabilities based planning as a common, all-hazard, major events planning process. This will support the establishment of a true National Preparedness System, which will provide a mechanism for measuring preparedness and informing future preparedness investments.

"The National Preparedness System is a system of systems. As stated in the National Preparedness Goal, "a system is a combination of facilities, equipment, personnel, procedures, and communications integrated into a common organizational structure to achieve a mission or outcome." Many processes, programs, and capabilities already in place within State, local, tribal, and private sector homeland security programs and across disciplines will support the National

Preparedness System. The emerging National Preparedness System provides a way to enhance these existing resources by networking them together more effectively.

"The National Preparedness System provides a means for the Nation to answer three fundamental questions: "*How prepared do we need to be*?", "*How prepared are we*?", and "*How do we prioritize efforts to close the gap*?" The system helps enable all levels of government to collaborate seamlessly in order to identify critical gaps and deficiencies, develop strategies to address those gaps and deficiencies, track and report on progress toward resolution, and aggregate this information to better understand our level of preparedness nationally. The system also helps enable leaders at all levels to allocate resources systematically to close capability gaps, thereby enhancing the effectiveness of preparedness efforts.

"The implications of moving to an integrated and adaptive National Preparedness System are significant. This shift will require organizational and operational change across agencies, disciplines and jurisdictions – and across State lines. Mutual aid agreements, inter-organizational linkages, information sharing, and collaboration become critical elements of the new homeland security landscape." (**DHS/ODP**, 2005, *State and Urban Area Homeland Security Strategy: Guidance on Aligning Strategies with the NPG*, p. 5)

National Preparedness System (NPS): "The National Preparedness System provides a way to organize preparedness activities and programs pursuant to the *National Preparedness Guidelines*…The desired end-state of our National Preparedness System is to achieve and sustain coordinated capabilities to prevent, protect against, respond to, and recover from all hazards in a way that balances risk with resources…. The National Preparedness System provides opportunities for all levels of government, the private sector, nongovernmental organizations, and individual citizens to work together to achieve priorities and capabilities outlined in the *Guidelines*." (**DHS**, 2007, *National Preparedness Guidelines*, p.22)

National Preparedness System (NPS): "DHS will coordinate the establishment of a national-level structure and process for the ongoing management and maintenance of the *Guidelines*. This will be closely coordinated with similar structures and processes for the NIMS, NRP, NIPP, and other elements of the National Preparedness System in order to help ensure national policy and planning for operations and preparedness are mutually supportive.

DHS is committed to working with its homeland security partners in updating and maintaining the *Guidelines* and related documents as part of a unified National Preparedness System, which will help ensure coordinated strategies, plans, procedures, policies, training, and capabilities at all levels of government. Implementation of the National Preparedness System is well under way. It is building on assessments of risk, development of management policies and strategies, identification of specific missions and supporting tasks in comprehensive plans, and matching of capabilities against requirements to execute these policies, strategies, and plans. Federal, State, local, tribal, and territorial governments will participate in assessments of readiness on a regular basis. The National Preparedness System will emphasize feedback and periodic reassessment to ensure the current state of preparedness is based on readiness metrics and is used as the basis for policy and programmatic decisions." (**DHS**, 2007, *National Preparedness Guidelines*, p.23)

National Preparedness System (NPS): "The National Preparedness System (NPS) provides a tool to assist jurisdictions, agencies, and organizations at all levels to plan for, assess, and track capabilities in a shared environment. It integrates various efforts to provide the comprehensive picture of preparedness and progress toward achieving the Goal [National Preparedness Goal]. (**FEMA**, *National Preparedness System: Current Prototype & Proposed Implementation Approach*, August 2, 2007, slide 3)

National Preparedness System (NPS): "A prototype is under development to meet requirements identified in HSPD-8 and Post-Katrina Emergency Management Reform Act (PKEMRA) by:

- Supporting capabilities-based planning and assessment
- Facilitating intergovernmental, inter-jurisdictional, interdisciplinary, and public/private sector coordination
- Providing a comprehensive picture of National preparedness
- Creating a tool to meet Federal and State reporting requirements established by HSPD-8 and PKEMRA. (**FEMA**, *NPS: Current Prototype & Proposed Implementation Approach*, August 2, 2007, slide 18)

National Preparedness System (NPS): "The President, acting through the [FEMA] Administrator, shall develop a national preparedness system to enable the Nation to meet the national preparedness goal. (b) COMPONENTS.—The national preparedness system shall include the following components:
(1) Target capabilities and preparedness priorities.
(2) Equipment and training standards.
(3) Training and exercises.
(4) Comprehensive assessment system.
(5) Remedial action management program.
(6) Federal response capability inventory.
(7) Reporting requirements.
(8) Federal preparedness." (**Post-Katrina Emergency Management Reform Act of 2006**, p. 1425)

National Preparedness System (NPS) Building Blocks:

- National Planning Scenarios
- Universal Task List (UTL)
- Target Capabilities List (TCL)
- Seven National Priorities. (**DHS/ODP**, *State and Urban Area Homeland Security Strategy: Guidance on Aligning Strategies with the NPG*, 2005, p. 2)

National Preparedness System Purpose: "The National Preparedness System (NPS) is being developed as a tool that:

- Supports capabilities-based planning and assessment
- Uses the Target Capabilities List (TCL) as the basis for planning and assessment

- Facilitates intergovernmental, interjurisdictional, interdisciplinary, and public/private sector coordination
- Addresses multiple reporting requirements
- Provides a comprehensive picture of National preparedness." (**FEMA**, *National Preparedness System: Current Prototype & Proposed Implementation Approach*, August 2, 2007, slide 13)

National Preparedness System Requirements:

- HSPD-8 and Post Katrina Emergency Management Reform Act (PKEMRA) require a comprehensive system to assess, on an on-going basis, the Nation's capabilities and overall preparedness, including operational readiness.

- PKEMRA: "Within 12 months, and annually thereafter, submit to Congress a report on the Nation's level of preparedness for all-hazards." It also requires that State submit an annual preparedness report.

- The Target Capabilities List (TCL) provides a framework and guide for all-hazards preparedness. Stakeholders have indicated that while it contains useful information, they are not sure how to use it.

- A tool with wide utility is needed to meet national preparedness requirements, and facilitate use of a capabilities-based approach to planning and preparedness." (**FEMA**, *National Preparedness System: Current Prototype & Proposed Implementation Approach*, August 2, 2007, slide 14)

National Preparedness System (NPS) Stakeholders: "Effective implementation of NPS will require participation by all stakeholders:

- Federal agencies with homeland security responsibilities
- Regional interagency planning groups
- State homeland security and other agencies
- Local jurisdictions and agencies
- Tribes

Non-government organizations." (**FEMA**, *NPS: Current Prototype & Proposed Implementation Approach*, August 2, 2007, slide 19)

National Preparedness System Stakeholder User Groups (NPS): "Stakeholder User Groups will guide development

- **Two Groups**
  - State/Local/Federal Stakeholder Group
  - Federal Stakeholder Group

- **The User Groups will**
  - Identify information needed by policy makers and managers
  - Identify desired functionality

- Identify desired report capabilities
- Identify relationship with other existing systems
- Test the system
- Encourage use" (**FEMA**, *NPS: Current Prototype & Proposed Implementation Approach*, August 2, 2007, slide 20)

National Principal Federal Official (PFO): "In the event of a single incident with national implications or in the case of multiple incidents, a national-level PFO may be designated to provide overall coordination of Federal incident management activities. The PFO may further delegate duties to a Deputy PFO, the FCO or other designated Federal official as appropriate to facilitate incident management span of control or after an event transitions to long-term recovery and/or cleanup operations." (**DHS**, *Notice of Change to the National Response Plan* (Version 5.0), May 25, 2006, p. 5)

National Priorities (Seven), National Preparedness Goal: "These seven priorities reflect a limited number of the cross-cutting initiatives and critical capabilities that should drive near-term planning and resource allocation efforts. The National Priorities are intended to guide the Nation's preparedness efforts to meet its most urgent needs, and fall into two categories: (1) overarching priorities that contribute to the development of multiple capabilities, and (2) capability-specific priorities that build selected capabilities for which the nation has the greatest need:

National Priorities Overarching Priorities
• Implement the National Incident Management System and National Response Plan
• Expanded Regional Collaboration
• Implement the Interim National Infrastructure Protection Plan

Capability-Specific Priorities
• Strengthen Information Sharing and Collaboration capabilities
• Strengthen Interoperable Communications capabilities
• Strengthen CBRNE Detection, Response, and Decontamination capabilities
• Strengthen Medical Surge and Mass Prophylaxis capabilities." (**DHS/ODP**, *State and Urban Area Homeland Security Strategy: Guidance on Aligning Strategies with the NPG*, 2005, p. 6)

National Processing Services Center (NPSC): "The National Processing Services Center (NPSC) is responsible for processing registrations for assistance that have been filed by individuals affected by a disaster. This includes:

- Gathering and reviewing information in order to consider the eligibility of applicants who have been referred to the Disaster Housing Assistance program.

- Responding to the questions, concerns, and issues of those who have been referred to the Disaster Housing Assistance program.

- Maintaining records for individuals who have been referred to the SBA.

- Maintaining records for applicants who have been referred to the Individual and Households Program along with various other Federal, State, local, and voluntary agencies engaged in providing assistance to those individuals affected by a disaster. (**FEMA**, *Disaster Basics* (IS-292), May 24, 2007 update, p. A-8, Glossary)

National Public Health Information Coalition (NPHIC): "The National Public Health Information Coalition is an independent organization of professionals sought after to improve America's health through public health communications. NPHIC senior public health information officers: Participate with the Centers for Disease Control and Prevention (CDC) and other public and private agencies to promote health and prevent disease; Identify methods to improve communications among members; Communicate with and through the news media to promote greater understanding and awareness of public health issues." (http://www.nphic.org)

National Radiological Defense Plan (1958): The first national radiological defense plan was developed in 1958 as an annex to the *National Plan for Civil Defense*, shortly thereafter renamed *The National Plan for Civil Defense and Defense Mobilization*. "The plan assigned radiologtical defense responsibilities to Federal, State, and local governments, and provided the guidelines for the development of State and local radiological defense plans." This was followed shortly by the development of a *Radiological Defense Planning Guide*. (**FCDA**, *Annual Report 1958*, p. 7)

National Rapid Support and Response Team (N-RSRT). (**DHS**, *Budget-in-Brief FY 08*, p. 68)

National Response Center (USCG): "The primary function of the National Response Center is to serve as the sole national point of contact for reporting all oil, chemical, radiological, biological, and etiological discharges into the environment anywhere in the United States and its territories. In addition to gathering and distributing spill data for Federal On-Scene Coordinators and serving as the communications and operations center for the National Response Team, the NRC maintains agreements with a variety of federal entities to make additional notifications regarding incidents meeting established trigger criteria. The NRC also takes Terrorist/Suspicious Activity Reports and Maritime Security Breach Reports." (**NRC**, *NRC Background*, 2002, p. 1)

National Response Center (NRC): "A national communications center for activities related to oil and hazardous substance response actions. The NRC, located at DHS/USCG Headquarters in Washington, DC, receives and relays notices of oil and hazardous substances releases to the appropriate Federal OSC." (**USCG**, *IM Handbook*, 2006, Glossary 25-17)

National Response Coordination Center (NRCC): FEMA Headquarters Emergency Operations Center (2007). "The NRCC, a component of the NOC, is FEMA's primary operations management center for most, but not all, national incident response and recovery incidents, as well as the focal point for national resource coordination. As a 24/7 operations center, the NRCC monitors potential or developing incidents and supports the efforts of regional and field components. The NRCC has well-tested capabilities within DHS to connect directly by video teleconference to all State EOCs and to FEMA regional emergency response support structures. The NRCC also has the capacity to surge staffing immediately in anticipation of or in response to a national incident by activating the full range of ESF teams and other personnel as needed to provide resources and policy guidance to a JFO or other local incident management

structures, as needed for incident response. The NRCC provides overall incident management coordination, conducts operational planning, deploys national-level entities and collects and disseminates incident information as it builds and maintains a common operating picture." (**DHS**, *NRF Comment Draft,* 2007, p. 54)

National Response Coordination Center (NRCC): "The FEMA NRCC, the operational component of the DHS National Operations Center (NOC)… provide[s] operational support to field-deployed resources to ensure synchronized federal response and recovery operations and to resolve national resource requirements." (**FEMA**, *DHS/FEMA Draft 2008 Hurricane CONPLAN*, October 31, 2007, p. 6)

National Response Coordination Center (NRCC): "The NRCC is the national-level interagency coordination center at FEMA Headquarters. The NRCC issues mission assignments at the national level as needed. The NRCC works closely with the Regional Response Coordination Center(s) (RRCC) or the Joint Field Office(s) (JFO) to ensure that mission assignments are not duplicated. The NRCC is responsible for adjudicating conflicts with requests for national resources." (**FEMA**, *Mission Assignment SOPs Draft*, 2007, p. 4; also 56)

National Response Framework (NRF): "Also, consider the National Response Plan, excuse me, the now called National Response Framework, which will be released by DHS in the near future. You will be told this is a national document, developed over many hours of collaboration between all levels of government and all disciplines. Let me be the first to say you should have a shovel nearby when you hear this. I've queried my colleagues at both the state and local level and realize that no one knows what information this document contains and we won't until we read it like everyone else in this room." (**Ashwood**, *Testimony on FEMA in 2007*, 2007, p. 2)

National Response Framework (NRF): "The purpose of the National Response Framework is to establish a comprehensive, national, all-hazards approach to domestic incident response. The Framework presents an overview of key response principles, roles and structures that guide the national response. It describes how communities, States, the Federal Government and private-sector and nongovernmental partners apply these principles for a coordinated, effective national response. And, it describes special circumstances where the Federal Government exercises a larger role, including incidents where Federal interests are involved and catastrophic incidents where a State would require significant support. Its real value, however, is in how these elements come together and are implemented by first responders, decision-makers and supporting entities to provide a unified national response….The *Framework* is written for senior elected and appointed leaders, such as Federal agency heads, State Governors, tribal leaders, mayors or city managers – those who have a responsibility to provide for effective incident management. At the same time, it informs emergency management practitioners, explaining the operating structures and tools used routinely by first responders and emergency managers at all levels of government. The *Framework* document is richly augmented with online access to supporting documents, further training and a source for exchanging lessons learned." (**DHS**, *Introducing the NRP*, Sep. 2007 Draft, p. 2)

National Response Framework (NRF): "The *National Response Framework* presents the guiding principles that enable all response partners to prepare for and provide a unified national

response to disasters and emergencies – from the smallest incident to the largest catastrophe…. The *Framework* defines the key principles, roles, and structures that organize the way we respond as a Nation. It describes how communities, tribes, States, the Federal Government, and private-sector and nongovernmental partners apply these principles for a coordinated, effective national response. It also identifies special circumstances where the Federal Government exercises a larger role, including incidents where Federal interests are involved and catastrophic incidents where a State would require significant support. The *Framework* enables first responders, decisionmakers, and supporting entities to provide a unified national response." (**DHS**, *Introducing the NRP*, Jan. 2008, p. 1)

National Response Framework (NRF): "Decentralization, disciplined initiative and freedom of action are the greatest strengths of our *National Response Framework*." (**DHS**, *NRF Comment Draft*, Sep 2007, p. 67)

National Response Framework (NRF): "A guide to how the nation conducts all-hazards incident management." (**FEMA**, *National Incident Management System* /Draft, 2007, 155)

National Response Framework (NRF): "Ultimately, our National Response Framework must help us strengthen the foundation for an effective national response, rapidly assess emerging incidents, take initial actions, expand operations as needed, and commence recovery actions to stabilize the area. This framework must be clearly written, easy to understand, and designed to be truly national in scope, meeting the needs of State, local, and Tribal governments and the private and non-profit sectors, as well as the Federal Government." (**White House**, *National Strategy for Homeland Security*, Homeland Security Council, October 2007, p. 31)

National Response Framework (NRF) Advance Readiness Activities: "There are times when we are able to anticipate impending or emergent events that will require a national response, such as an upcoming hurricane season, a potential pandemic, or a period of heightened terrorist threat. We must capitalize on this critical window of opportunity to increase readiness activities. For example, we can pre-identify needs and fill gaps in our current capabilities or resources that will be required to address the specific nature of the forthcoming incident. We also will pre-position commodities such as water, ice, emergency meals, tarps, and other disaster supplies so they will be readily available for use. Additional advance readiness activities include establishing contracts with the private sector prior to an incident and developing pre-negotiated agreements with Federal departments and agencies to ensure that appropriate Federal resources are available during a crisis." (**White House**, *National Strategy for Homeland Security*, Homeland Security Council, October 2007, p. 34)

National Response Framework (NRF) Applicability: "As with its predecessor, the *National Response Plan*, the *National Response Framework* applies to both Stafford Act and non-Stafford Act incidents." (**DHS**, *NRF FAQs*, Jan 2008, 2)

National Response Framework (NRF) Audiences: "The NRF is written especially for government executives, private-sector business, and nongovernmental leaders and emergency management practitioners." (DHS, *NRF Fact Sheet*, Jan 2008)

National Response Framework (NRF) Catastrophic Incident Annex Purpose and Scope: "Purpose: The Catastrophic Incident Annex to the National Response Framework (NRF-CIA) establishes the context and overarching strategy for implementing and coordinating an accelerated, proactive national response to a catastrophic incident. A more detailed and operationally specific National Response Framework Catastrophic Incident Supplement (NRF-CIS) is published independently of the NRF and annexes.

"Scope…. Recognizing that Federal and/or national resources are required to augment overwhelmed State, tribal, and local response efforts, the NRF-CIA establishes protocols to preidentify and rapidly deploy key essential resources (e.g., medical teams, urban search and rescue teams, transportable shelters, medical and equipment caches, etc.) that are expected to be urgently needed/required to save lives and contain incidents. Accordingly, upon designation by the Secretary of Homeland Security of a catastrophic incident, Federal resources, organized into incident-specific "packages," deploy in accordance with the NRF-CIS and in coordination with the affected State and incident command structure.

"Where State, tribal, or local authorities are unable to establish or maintain an effective incident command structure due to catastrophic conditions, the Federal Government, at the direction of the Secretary of Homeland Security may establish a unified command structure to save lives, protect property, secure critical infrastructure/key resources, contain the event, and protect national security. The Federal Government shall transition to its normal role supporting incident command through State, tribal, or local authorities when their command is reestablished." (**DHS**, *National Response Framework, Catastrophic Incident Annex*, Sep.10, 2007 Draft, p. 1)

National Response Framework (NRF) Components: "The *Framework* is structured as follows:
Chapter I: Roles and Responsibilities. Sharpens the focus on who is involved with emergency management activities at the local, tribal, State, and Federal levels and with the private sector and NGOs.

Chapter II: Response Actions. Describes what we as a Nation collectively do to respond to incidents.

Chapter III: Response Organization. Explains how we as a Nation are organized to implement response actions.

Chapter IV: Planning. Emphasizes the importance of planning and summarizes the elements of national planning structures.

Chapter V: Additional Resources. Summarizes the content and plan for the online NRF Resource Center." (**DHS**, *Introducing… NRF*, Jan 2008, p. 4)

National Response Framework Criteria For Measuring Key Aspects of Response Planning: "The *Framework* employs common criteria to measure key aspects of response planning:

Acceptability. A plan is acceptable if it can meet the requirements of anticipated scenarios, can be implemented within the costs and timeframes that senior officials and the public can support, and is consistent with applicable laws.

Adequacy. A plan is adequate if it complies with applicable planning guidance, planning assumptions are valid and relevant, and the concept of operations identifies and addresses critical tasks specific to the plan's objectives.

Completeness. A plan is complete if it incorporates major actions, objectives, and tasks to be accomplished. The complete plan addresses the personnel and resources required and sound concepts for how those will be deployed, employed, sustained, and demobilized. It also addresses timelines and criteria for measuring success in achieving objectives, and the desired end state. Completeness of a plan can be greatly enhanced by including in the planning process all those who could be affected.

Consistency and Standardization of Products. Standardized planning processes and products foster consistency, interoperability, and collaboration.

Feasibility. A plan is considered feasible if the critical tasks can be accomplished with the resources available internally or through mutual aid, immediate need for additional resources from other sources (in the case of a local plan, from State or Federal partners) are identified in detail and coordinated in advance, and procedures are in place to integrate and employ resources effectively from all potential providers.

Flexibility. Flexibility and adaptability are promoted by decentralized decisionmaking and by accommodating all hazards ranging from smaller-scale incidents to wider national contingencies.

Interoperability and Collaboration. A plan is interoperable and collaborative if it identifies other plan holders with similar and complementary plans and objectives, and supports regular collaboration focused on integrating with those plans to optimize achievement of individual and collective goals and objectives in an incident." (**DHS**, *NR*F, 2008, 74-75)

National Response Framework -- DHS Implementation of Coordinating Mechanisms: "The following four HSPD-5 criteria define situations for which DHS shall assume overall Federal incident management coordination responsibilities within the Framework and implement the Framework's coordinating mechanisms:

(1) a Federal department or agency acting under its own authority has requested DHS assistance,

(2) the resources of State and local authorities are overwhelmed and Federal assistance has been requested,

(3) more than one Federal department or agency has become substantially involved in responding to the incident, or

(4) the Secretary has been directed by the President to assume incident management responsibilities." (**DHS**, *NRP*, Jan 2008, 25)

National Response Framework (NRF) Doctrine: "Incidents that begin with a single response discipline within one jurisdiction may quickly expand to multi-disciplinary, multi-jurisdictional incidents that require additional resources and capabilities. In order to ensure high-level

organization and efficiency among multiple actors in these challenging and complex environments, the response community must rely on fundamental principles that guide the full range of response activities. NIMS forms the backbone of this doctrine and includes, among other things, an Incident Command System as the overall management structure for responding to an incident as well as the concept of Unified Command, which provides for and enables joint decisions and action based on mutually agreed-upon objectives, priorities, and plans among all homeland partners involved in the response effort without affecting individual agency authority, responsibility, or accountability. We will continue to expand and refine the full set of fundamental doctrinal principles underlying our National Response Framework. For example, we will incorporate and further emphasize the concept of readiness to act that is imperative for no-notice incidents as well as incidents that have the potential to expand rapidly in size, scope, or complexity. Through the framework, we will encourage engaged partnerships in which all organizations establish shared objectives, assess their capabilities, identify gaps, and work collaboratively to fill those gaps well in advance of an incident. We also will underscore that our national response must be scalable, flexible, and adaptable to respond to the full range of potential incidents that our Nation could confront." (**White House**, *National Strategy for Homeland Security*, October 2007, pp. 32-33)

National Response Framework (NRF) Doctrine/Key Principles/Key Concepts: "Key Principles of the *Framework*

1. Engaged partnership
2. Tiered response
3. Scalable, flexible and adaptable operational capabilities
4. Unity of effort through unified command
5. Readiness to act" (**DHS**, *National Response Framework* (Comment Draft), September 10, 2007, p. 2; **DHS**, *NRF FAQs*, Jan 2008, 1)

National Response Framework – Edits Incorporated From 2007 Comment Period: "State and local officials provided input on the narrative style, readability, specific word use and tone of the draft NRF document, and numerous changes were made to the final document based on those comments. Input from state partners during the comment period also pointed out some inconsistencies in the draft document between the NRF language and the Post-Katrina Emergency Management Reform Act which were addressed. Stakeholder groups during the comment period also sought specific language addressing the unique challenges faced by special needs populations. Based on stakeholder comments, special needs language was added to the document. State and tribal representatives requested that clarifications be made in the core document to reflect that states and tribes do not have to exhaust all resources (including mutual aid) before requesting Federal assistance following disasters."

"The "Incident of National Significance" term utilized in the *NRP* caused significant confusion. Many readers understood that a declaration of an Incident of National Significance by the Secretary of Homeland Security was a requirement for the *NRP* to be invoked or Federal assistance or interagency incident management support to be provided. This was not true, but efforts to clarify the Incident of National Significance term were not completely successful. And since the actual declaration of an Incident of National Significance brought no new authorities to the incident response, the decision was made to eliminate the term. (**DHS**, *NRF FAQs*, Jan 08, 5)

National Response Framework (NRF) Evolution: "This *Framework* was preceded 15 years earlier by a *Federal Response Plan* (1992) that focused largely on Federal roles and responsibilities. Following the 9/11 attacks, more urgent efforts were made to understand and implement common incident management and response principles and to develop common planning frameworks. The 2004 *NRP* was an early outgrowth of those discussions, replacing the *Federal Response Plan*. It was published one year after creation of the Department of Homeland Security (DHS). The *NRP* broke new ground in integrating all levels of government in a common incident management framework. It incorporated incident coordination roles for Federal agencies2 as defined by several new laws and Presidential directives. Nine months after Katrina's landfall, a notice of change to the *NRP* was released, incorporating preliminary lessons learned from the 2005 hurricane season…. Stakeholders have advised that both the initial *NRP* and its 2006 iteration were bureaucratic and internally repetitive. Users also suggested the *NRP* was still insufficiently *national* in its focus, which is to say that it should speak more clearly to the roles and responsibilities of all parties involved in response. Moreover, it was evident that the *NRP* and its supporting documents did not constitute a true operational *plan* in the sense understood by emergency managers. Its content was inconsistent with the promise of its title. In the last several years, operational planning on a national basis for specific types of incidents has matured. Both public and private sectors are making significant homeland security investments to strengthen the Nation's response capability…. Effective response to an incident is a shared responsibility of governments at all levels, the private sector and NGOs, and individual citizens. This *Framework* commits the Federal Government, in partnership with local, tribal, and State governments and the private sector, to complete both strategic and operational plans for the incident scenarios specified in the *National Preparedness Guidelines*.3 These plans will ultimately improve significantly the Incident Annexes to this *Framework*, which have been carried forward from the *NRP*." (**DHS**, *NRF*, Jan 2008, 2)

National Response Framework (NRF) Governmental Responsibilities: "It is important that each level of government adapt and apply the general roles outlined in the *Framework*. To do this, organizations should define key leadership and staff functions, adopt capabilities-based planning as the method to build response capabilities, and impose the discipline needed to plan and operate effectively." (**DHS**, *NRF*, Jan 2008, 5)

National Response Framework (NRF) Organization:

- *Core Document* (National Response Framework)
- *Emergency Support Function Annexes* -- group Federal resources and capabilities into functional areas that are most frequently needed in a national response (e.g., Transportation, Firefighting, Mass Care).
- *Support Annexes* -- describe essential supporting aspects that are common to all incidents (e.g., Financial Management, Volunteer and Donations Management, Private-Sector Coordination).
- *Incident Annexes* -- address the unique aspects of how we respond to seven broad incident categories (e.g., Biological, Nuclear/Radiological, Cyber, Mass Evacuation).
- *Partner Guides* -- provide ready references describing key roles and actions for local, tribal, State, Federal, and private-sector response partners. (**DHS**, *NRF*, Jan 2008, 4)

National Response Framework (NRF) Purpose: "The purpose of the *National Response Framework* is to establish a comprehensive, national, all-hazards approach to domestic incident response.

"The *Framework* presents an overview of key response principles, roles and structures that guide the national response. It describes how communities, States, the Federal Government and private-sector and nongovernmental partners apply these principles for a coordinated, effective national response. And, it describes special circumstances where the Federal Government exercises a larger role, including incidents where Federal interests are involved and catastrophic incidents where a State would require significant support. Its real value, however, is in how these elements come together and are implemented by first responders, decision-makers and supporting entities to provide a unified national response." (**DHS**, *Introducing…NRP*, September 2007, p. 2)

National Response Framework (NRF) Purpose: "To ensure that government executives, private-sector and nongovernmental organization (NGO) leaders, and emergency management practitioners across the nation understand the domestic incident response roles, responsibilities and relationships in order to respond more effectively to any type of incident." (**DHS,** *National Response Framework: Frequently Asked Questions*, Jan 2008, p. 1)

National Response Framework NRF Resource Center: "To assist readers in implementing the *Framework*, the Resource Center is an online repository of supporting documents, resources, and educational materials. It is intended especially to assist emergency management practitioners. This repository provides a single, Web-based portal for documents, information, training materials, and other tools needed for response partners to understand and execute their roles under the *Framework*. Formally cleared annexes, resources, and other reference material associated with the *Framework* are posted on this portal. In addition, the Resource Center portal will be dynamic, providing links to additional preparedness resources and updating the *Framework*'s formal supporting documents as necessary. The online Resource Center's home page may be found at http://www.fema.gov/NRF. As all Resource Center postings will be routinely evaluated, updated, and augmented, the remainder of this chapter contains a roadmap of what initially conveys from the *National Response Plan* (*NRP*) and an outline of work to come.

"The Resource Center contains multiple supporting documents, including ESF, Support, and Incident Annexes and several informational documents, such as an overview of the main Stafford Act provisions, a guide to authorities and references, and an acronym list. As noted in Chapter IV, ongoing planning activities will result in the development of additional strategic guidance and plans, which will be added to the Resource Center upon approval and as necessary." (**DHS**, *NRF*, 2008, 77)

National Response Framework (NRF) Scenario Concepts: The NRF Incident annexes describe the concept of operations to address specific contingency or hazard situations or an element of an incident requiring specialized application of the NRF for the following incidents:

- Biological
- Catastrophic

- Cyber
- Food and Agricultural
- Mass Evacuation
- Nuclear/Radiological
- Terrorism Incident Law Enforcement and Investigation (**FEMA**, NRF Resource Center)

National Response Framework (NRF) Scope: "The *Framework* provides structures for implementing national-level policy and operational coordination for domestic incident response. In this document, incidents include actual or potential emergencies or all-hazard events that range from accidents and natural disasters to actual or potential terrorist attacks. Such incidents range modest events wholly contained within a single community to others that are catastrophic in nature and national in their scope of consequences." (**DHS**, *NRF FAQs*, Jan 2008, 1)

National Response Framework (NRF) Special Circumstances: "*There are special circumstances where the Federal Government exercises a larger, more proactive role* [in disaster response]. This includes catastrophic incidents when local and State governments require significant support, and incidents where Federal interests are directly implicated, such as those involving primary Federal jurisdiction or authorities. For example, the Federal Government will lead response efforts to render safe weapons of mass destruction and coordinate related activities with State and local partners, as appropriate." (**White House**, *National Strategy for Homeland Security*, October 2007, p. 33)

National Response Framework (NRF) Support Functions: The NRF Support annexes describe coordination and execution of common functional processes and administrative requirements necessary to ensure efficient and effective incident management. During an incident, numerous procedures and administrative functions are required to support incident management. The 8 Support Annexes are:

- Critical Infrastructure and Key Resources
- Financial Management
- International Coordination
- Private-Sector Coordination
- Public Affairs
- Tribal Relations
- Volunteer and Donations Management
- Worker Safety and Health (**FEMA**, NRF Support Center, 2008)

National Response Plan (NRP): "Homeland Security Presidential Directive (HSPD)-5, *Management of Domestic Incidents*, requires the creation of a National Response Plan (NRP) to integrate Federal Government prevention, preparedness, response, recovery and mitigation plans into one all-discipline, all-hazard approach to domestic incident management. The NRP, using the National Incident Management System (NIMS), is intended to provide the core organizational structure and operational mechanisms for Federal support to State and local authorities, implementation of direct Federal incident management authorities and responsibilities under the law, and full coordination of resources among Federal departments and agencies. This plan was developed through an inclusive interagency, inter-jurisdictional process

incorporating the expertise and recommendations of Federal, State, local, tribal, and private sector stakeholders." (**DHS**, *National Response Plan* (Draft #1), February 25, 2004, p. 1, Secretary of Homeland Security Tom Ridge Transmittal Letter)

National Response Plan (NRP): "The NRP supercedes the Federal Response Plan (FRP), United States Government Interagency Domestic Terrorism Concept of Operations Plan (CONPLAN), and the Initial National Response Plan (INRP). The NRP, as the core plan for national incident management, is linked to an array of incident or hazard-specific Federal contingency plans, such as National Oil and Hazardous Substances Pollution Contingency Plan (NCP) and Federal Radiological Emergency Response Plan (FRERP) that are designed to implement the specific statutory authorities and responsibilities of various departments and agencies. These plans establish protocols for the management of hazard-specific contingencies and provide the vital mechanisms for managing thousands of incidents annually. The plans are fully incorporated as key components of the NRP when implemented for incidents of national significance." (**DHS**, *National Response Plan* (Draft #1), February 25, 2004, p. 2)

National Response Plan (NRP): "The NRP establishes a national framework for domestic incident management and applies to Incidents of National Significance. Federal, State, local, and tribal agencies respond to the vast majority of incidents acting under their authorities or through existing agency or interagency contingency plans." (**DHS**, *National Response Plan* (Draft #1), February 25, 2004, pp. 3-4)

National Response Plan (NRP): "Domestic incident management activities addressed in the NRP span the event including prevention, preparedness, response, recovery, and mitigation. As shown in Figure 2, an incident typically begins with notification of a potential or actual situation setting in motion mechanisms to activate and deploy resources to interdict and prevent the incident from happening, to mitigate its effects, and to respond and recover from the impacts of the incident." (**DHS**, *National Response Plan* (Draft #1), February 25, 2004, p. 15)

National Response Plan (NRP): "A plan mandated by HSPD-5 that integrates Federal domestic prevention, preparedness, response, and recovery plans into one all-discipline, all-hazards plan." (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 2007, p. 57)

National Response Plan (NRP): "The NRP framework provides the following to guide a response to incidents of national significance:

(a) Best practices and procedures from various incident management disciplines — homeland security, emergency management, law enforcement, fire-fighting, hazardous materials response, public works, public health, emergency medical services, and responder and recovery worker health and safety — and integrates them into a unified coordinating structure.

(b) The framework for Federal interaction with State, local, and tribal governments; the private sector; and NGOs in the context of domestic incident prevention, preparedness, response, and recovery activities.

(c) The foundation for the development of detailed supplemental plans and procedures to effectively and efficiently implement Federal incident management activities and assistance in the context of specific types of incidents.

(d) Integration of the capabilities and resources of governmental jurisdictions, incident management and emergency response disciplines, NGOs, and the private sector into a cohesive, coordinated, and seamless national framework for domestic incident management.

(e) Separate incident annexes for biological events, catastrophic events, oil and HAZMAT, terrorism, and nuclear/radiological events. The joint force has a CBRNE CM role with specified and implied tasks in each of the CBRNE areas as well as in many of the ESF annexes (see the NRP for details).

(f) The NRP Catastrophic Incident Supplement provides the operational framework for implementing the strategy contained in the NRP Catastrophic Incident Annex." (**JCS/DOD**, *CBRNE Consequence Management* (JP 3-41), 2006, pp. II-13 and II-14)

National Response Plan (NRP): HSPD-5 directed the Secretary of Homeland Security to develop and administer an NRP to integrate the current family of federal domestic prevention, preparedness, response and recovery plans into a single all-discipline, all-hazards plan in an attempt to unify domestic incident management. The NRP has superseded other emergency response plans (e.g., US Government Interagency Domestic Terrorism Concept of Operations Plan, Federal Radiological Emergency Response Plan, Mass Migration Emergency Plan, and the National Oil and Hazardous Substances Pollution Contingency Plan). In addition to consolidating federal plans, other modifications within the NRP that impact DOD are the establishment of a Homeland Security Operations Center, the establishment of an interagency incident management group, and the creation of a principal federal official who may be appointed to represent the Secretary of Homeland Security at the incident site." (**JCS/DoD**, *Homeland Security*, 2005, p. IV-13)

National Response Plan (NRP): "A document that describes the structure and processes comprising a national approach to domestic incident management designed to integrate the efforts and resources of Federal, State, local, tribal, private-sector, and nongovernmental organizations." (**USCG**, *IM Handbook*, 2006, Glossary 25-17)

National Response Plan (NRP) Purpose: "The purpose of the NRP is to establish a comprehensive, national, all-hazards approach to domestic incident management across a spectrum of activities including prevention, preparedness, response, and recovery.

The NRP incorporates best practices and procedures from various incident management disciplines—homeland security, emergency management, law enforcement, firefighting, hazardous materials response, public works, public health, emergency medical services, and responder and recovery worker health and safety—and integrates them into a unified coordinating structure." (**DHS**, *National Response Plan*, 2004, p. 2P

National Response System (NRS): "Our National Response System routinely and effectively responds to a wide range of oil and hazardous substance releases. It is a multi-layered system of individuals and teams from local, state, and federal agencies, industry, and other organizations that share expertise and resources to ensure that oil spill control and cleanup activities are timely and efficient, and that they minimize threats to human health and the environment.
At the heart of the system is the National Contingency Plan (NCP)…a regulation developed to ensure that the resources and expertise of the federal government are available immediately for oil or hazardous substance releases that are beyond the capabilities of local and state responders. The NCP provides the framework for the National Response System and establishes how it works." (**EPA**, *National Response System*, September 17, 2007)

National Response Team (NRT): "The NRT, comprised of the 16 Federal agencies with major environmental and public health responsibilities, is the primary vehicle for coordinating Federal agency activities under the NCP. The NRT carries out national planning and response coordination and is the head of a highly organized Federal oil and hazardous substance emergency response network. EPA serves as the NRT Chair, and DHS/USCG serves as Vice Chair." (**USCG**, *IM Handbook*, 2006, Glossary 25-17)

National Risk Assessment: "**The National Risk Assessment (NRA)** is a classified cross-government document which incorporates expertise from a wide range of departments and agencies. It assesses the impact and likelihood of the major risks, both hazards and threats, that the country could face over a five year period, enabling prioritisation of the UK's planning for emergencies…. Understanding the risks and determining their relative significance in terms of potential impact is the starting point for emergency planning. The key to turning this into useful planning information is remembering that it is not the risks themselves that people have to deal with when things go wrong, but their consequences." (**UK Cabinet Office**. *The Risk Register*, 2008, 4)

National Search and Rescue Plan (NSP): "Objectives:

a. Provide a United States Plan for coordinating civil SAR services to meet domestic needs, international commitments, and to document related national policies;

b. Support lifesaving provisions of IMO's International Convention on Maritime Search and Rescue, ICAO's Convention on International Civil Aviation (Annex 12), certain international agreements to which the United States is Party, and similar international instruments;

c. Provide an overall Plan for coordination of civil SAR operations, effective use of available resources, mutual assistance, and efforts to improve such cooperation and services;

d. Integrate available civil SAR resources into a cooperative network for greater protection of life and property and to ensure greater efficiency and economy; and

e. Enable the United States to satisfy its humanitarian, and national and international legal obligations." (**National Search and Rescue Committee** (US GOV). *National Search and Rescue Plan of the United States*, 2007, p. 3)

"This Plan does *not* cover operations such as:

a. Air ambulance services which did not result from a rescue or recovery operation;
b. Rescues from space (although rescue of persons returned from space can be included);
c. Military operations, such as combat SAR or other types of recovery by military operations to remove military or civilian personnel from harm's way;
d. Salvage operations;
e. Assistance in cases of civil disturbance, insurrection or other emergencies which endanger life or property or disrupt the usual process of government; and
f. Operations and coordination in addition to those covered by this Plan that might be carried out concurrently with civil SAR operations on scene, such as could occur during a disaster or terrorism response situation, or an Incident of National Significance." (**National Search and Rescue Committee** (US GOV). *National SAR Plan of the US*, 2007, p. 11)

National Search and Rescue Committee (NSARC): "The interagency Committee that oversees the NSP and serves as a federal coordinating forum for national civil SAR matters." (**National Search and Rescue Committee**, *National Search & Rescue Plan of the US*, 2007, 2)

National Security: "Definition: a comprehensive program of integrated policies and procedures for the Departments, agencies, and functions of the United States Government aimed at protecting the territory, population, infrastructure, institutions, values, and global interests of the Nation." (**DHS**, *Lexicon; Terms and Definitions*, October 23, 2007, pp. 18-19)

National Security: "The concept of national security has broadened, but that is where agreement ends. The evolution of the concept of national security has been underway for some time. In the 1980s a debate raged about whether the environment was a security issue. A similar argument emerged with respect to health in the late 1990s. Today those debates are over; the pressure of today's constantly changing and highly unpredictable security landscape has caused policy makers and analysts to generally accept that the concept of national security has broadened well beyond the one used by decision makers for most of the Cold War era.

But its borders remain fuzzy, and it is unlikely that the concept of national security will become more precisely bounded in the near future. Increasingly, new issues will push their way onto the national security agenda, and they will not arrive with neat labels. They will become national security issues through the interaction of popular opinion, the course of events at home and abroad, and the actions of presidents and their administrations. For example, the Clinton administration identified HIV/AIDS as not simply a domestic public health concern, but an international security challenge. The concern and programs to deal with it were continued by the Bush administration." (**Project on National Security Reform**, *Ensuring Security*…, 2008 p. 9)

National Security: "…our understanding of national security has changed. In the past, the state was the traditional focus of foreign, defence and security policies, and national security was understood as dealing with the protection of the state and its vital interests from attacks by other states. Over recent decades, our view of national security has broadened to include threats to individual citizens and to our way of life, as well as to the integrity and interests of the state.

That is why this strategy deals with transnational crime, pandemics and flooding – not part of the traditional idea of national security, but clearly challenges that can affect large numbers of our citizens, and which demand some of the same responses as more traditional security threats, including terrorism. (**UK Cabinet Office**, *The National Security Strategy of the* UK, 2008, 3)

National Security Act of 1947: "The National Security Act of 1947, as amended, established the NSC to advise the President with respect to the integration of domestic, foreign, and military policies relating to national security." (**JCS/DoD**, *Homeland Security*, 2005, p. II-15)

National Security and Homeland Security Strategy: "The *National Security Strategy of the United States* aims to guarantee the sovereignty and independence of the United States, with our fundamental values and institutions intact. It provides a framework for creating and seizing opportunities that strengthen our security and prosperity.

The *National Strategy for Homeland Security* complements the *National Security Strategy of the United States* by addressing a very specific and uniquely challenging threat – terrorism in the United States – and by providing a comprehensive framework for organizing the efforts of federal, state, local and private organizations whose primary functions are often unrelated to national security." (**White House**, *National Strategy for Homeland Security*, July 2002, p. 5)

National Security and Homeland Security Strategy: Our understanding of homeland security continued to evolve after September 11, adapting to new realities and threats. As we waged the War on Terror both at home and abroad, our Nation endured Hurricane Katrina, the most destructive natural disaster in U.S. history. The human suffering and staggering physical destruction caused by Katrina were a reminder that threats come not only from terrorism, but also from nature. Indeed, certain non-terrorist events that reach catastrophic levels can have significant implications for homeland security. The resulting national consequences and possible cascading effects from these events might present potential or perceived vulnerabilities that could be exploited, possibly eroding citizens' confidence in our Nation's government and ultimately increasing our vulnerability to attack. This *Strategy* therefore recognizes that effective preparation for catastrophic natural disasters and man-made disasters, while not homeland security *per se*, can nevertheless increase the security of the Homeland. (**White House**, *National Strategy for Homeland Security*, Homeland Security Council, October 2007, p. 3)

National Security and Natural Disasters: "*Natural disasters are not national security issues.* The new strategy [NSHS 2007] places undue emphasis on responding to natural disasters. The federal government does have responsibilities in this area, and use of homeland security instruments like the Coast Guard and the National Guard is appropriate in disaster response efforts. However, hurricanes are not national security threats. Treating them as such threatens to cede greater power and authority to the executive branch. The expanded emphasis on natural disasters in the revised strategy was a knee-jerk reaction to criticism over the response to Katrina rather than a necessary change in strategic focus. The original homeland security strategy stressed that national disaster systems should be structured to respond to "all hazards," both natural and manmade. That strategic guidance was sufficient." (**Carafano**, 10 Oct. 2007, p. 1)

[BWB Note: The words "Disaster," "Natural," and "Catastrophe" do not appear in *The National Security Strategy of the United States.*]

National Security and Terrorism Prevention: "The National Security and Terrorism Prevention program provides competitive grants that will support both capital projects and operational staffing proposals. Rather than rely on formulaic allocation and pass-through mechanisms, this program provides competitive grants to specific state and local agencies to support proposals which address national vulnerabilities identified by the Secretary as priorities. In 2009, the Secretary will invite states to submit project proposals to support REAL ID implementation and buffer zone protection for critical infrastructure. Final grant allocations will be determined competitively by the Secretary on the basis of how well proposals address these identified national vulnerabilities." (FEMA, *Statement of R. David Paulison, Administrator, on the Fiscal Year 2009 President's Budget Before the Committee on Appropriations Subcommittee on Homeland Security, U.S. House of Representatives*, March 11, 2008, p. 4)

National Security Decision Directive (NSDD) 26, US Civil Defense Policy, 1982: "It is the policy of the United States to enhance the deterrence of strategic nuclear war through a strong and balanced program of strategic forces, including effective capabilities for strategic defense. Civil Defense, along with an effective Continuity of Government program, emergency mobilization, and secure and reconstitutable telecommunications systems, is an essential ingredient of our nuclear deterrent forces. It is a matter of national priority that the US have a Civil Defense program which provides for the survival of the US population… Accordingly, I direct that the US Civil Defense program provide an improved basis for dealing with crises and carrying out eventual national recovery. The US Civil Defense program will:

- Enhance deterrence and stability in conjunction with our strategic offensive and other strategic defensive forces. Civil Defense, as an element of the strategic balance, should assist in maintaining perceptions that this balance is favorable to the US.
- Reduce the possibility that the US could be coerced in time of crisis.
- Provide for survival of a substantial portion of the US population in the event of nuclear attack preceded by strategic warning and for continuity of government, should deterrence and escalation control fail.
- Provide an improved ability to deal with natural disasters and other large-scale domestic emergencies….

The Federal Emergency Management Agency will have overall operational supervision of this program. Funds for the program will be contained in the FEMA budget. In order to ensure interagency cooperation and support in the program, the Civil Defense Working Group of the Emergency Mobilization Preparedness Board will be responsible for, among other things, assuring coordination between the Civil Defense program and mobilization preparedness actions and programs, and the preparation of semi-annual reports to the President." (**White House**, *NSDD 26: US Civil Defense Policy*, March 16, 1982, pp. 1-2)

National Security Decision Directive 47 (Emergency Mobilization Preparedness), 1982: "It is the policy of the United States to have an emergency mobilization preparedness capability that will ensure that government at all levels, in partnership with the private sector and the American people, can respond decisively and effectively to any major national emergency with defense of

the United States as the first priority." (**White House**. *Emergency Mobilization Preparedness [NSDD-47] (U)*, July 22, 1982, p. 1)

National Security Decision Directive 259, U.S. Civil Defense (President Reagan, 1987): "It is the policy of the United States to have a civil defense capability as an element of our overall national security posture.

Principles, Concepts, and Objectives

"The civil defense program will continue to support all-hazard integrated emergency management at State and local levels, to the extent that this is consistent with and contributes to preparedness of the Nation in the event of an attack, whether by nuclear or non-nuclear means….

"The program will emphasize development of a civil defense infrastructure capable of rapid expansion in a national security emergency. The objective of the…program will include:

1. Population protection capabilities with the Federal Government providing guidance and assistance to enable State and Local governments to develop the requisite plans, systems, and capabilities.
2. State and local government crisis management capabilities to effectively support the population in national security emergencies.
3. Information to promote a clear understanding by the public of threats, including nuclear attack, which may affect their localities, and on actions they should take to increase their chances of survival.
4. Information to assist U.S. business and industry in taking measures to protect their work forces and physical assets in national security emergencies." (**White House**, *NSDD 259*, February 4, 1987, p. 1 of 3)

Implementation

The Federal Civil Defense Act of 1950, as amended (50 U.S.C. App. 2251 et seq.) provides that responsibility for civil defense is vested jointly in the Federal Government and the States and their political subdivisions. Accordingly, the U.S. Civil Defense program will be based on the following:

1. The Federal Government will focus on guidance to the public and to State and local governments to improve preparedness for national security emergencies. Financial assistance will be provided in cooperation with State and local governments.
2. ….
3. The States have the primary responsibility for developing their capabilities for peacetime emergencies and share responsibility for attack preparedness. They should support development of civil defense plans, systems, and capabilities for themselves and their political subdivisions. States will assure that where Federal civil defense funds and assistance are applied to natural and technological disaster preparedness, such use is consistent with, contributes to, and does not detract from attack preparedness…." (**White House**, *NSDD 259*, February 4, 1987, p. 3 of 3)

National Security Emergency: "Any occurrence, including natural disaster, military attack, technological emergency, or other emergency, that seriously degrades or seriously threatens the

national security of the United States." (**FEMA**, *Disaster Dictionary* 2001, 84; cites Executive Order 12656; **DoD**, *MACDIS*, 1994, p. 19)

National Security Integration Center: "In April 2006, ICE created the National Security Integration Center (NSIC), which partners investigators and intelligence analysts to "operationalize" intelligence reporting." (**DHS**, *Fact Sheet: ICE Accomplishments FY 2006*)

National Security Planning Guidance (NSPG): The 2006 Quadrennial Defense Review (QDR) recommended the creation of a National Security Planning Guidance (NSPG), aimed at directing the development of both military and nonmilitary plans and institutional capabilities. The QDR advocates an NSPG that would set priorities and clarify national security roles and responsibilities to reduce capability gaps and eliminate redundancies. (**DoD**, *Building Partnership Capacity: Quadrennial Defense Review Execution Roadmap*, May 22, 2006, p. 7)

National Security Presidential Directive 51 (NSPD-51/HSPD-20): National Continuity Policy, April 4, 2007, Released May 9, 2007. *Purpose*: "This directive establishes a comprehensive national policy on the continuity of Federal Government structures and operations and a single National Continuity Coordinator responsible for coordinating the development and implementation of Federal continuity policies. This policy establishes "National Essential Functions," prescribes continuity requirements for all executive departments and agencies, and provides guidance for State, local, territorial, and tribal governments, and private sector organizations in order to ensure a comprehensive and integrated national continuity program that will enhance the credibility of our national security posture and enable a more rapid and effective response to and recovery from a national emergency." (**White House**, *NSPD-51*, May 9, 2007) [Supercedes PDD 67, 21Oct1998]

National Security Professional Development: "By the authority vested in me as President by the Constitution and the laws of the United States of America, and in order to enhance the national security, it is hereby ordered as follows: Section 1. Policy. In order to enhance the national security of the United States, including preventing, protecting against, responding to, and recovering from natural and manmade disasters, such as acts of terrorism, it is the policy of the United States to promote the education, training, and experience of current and future professionals in national security positions (security professionals) in executive departments and agencies (agencies)." (**White House**, *Executive Order 13434: National Security Professional Development*, May 17, 2007)

National Security Strategy (NSS): "A document approved by the Presidnet of the United States for developing, applying, and coordinating the instruments of national power to achieve objectives that contribute to national security." (**DOD/Joint Chiefs of Staff**, *DOD Dictionary of Military and Associated Terms* (Joint Publication (JP) 1-02), 2006)

National Security Strategy (NSS) of the United States: "The NSS establishes homeland security as the first priority of the Nation. The Armed Forces' role in homeland security is complex, combining actions overseas and at home to **protect the United States**. Our first line of defense is abroad and includes mutually supporting activities with US allies to counter threats close to their source. Closer to home, the Armed Forces use their capabilities to secure strategic

air, land, sea and space approaches to the United States and its territory. When directed, the Armed Forces employ military capabilities at home to protect the nation, the domestic population and critical infrastructure from direct attack." (**DOD/JCS**, *The NMS of the USA*, 2004, 2)

National Security Strategy (NSS) of the United States: "The U.S. national security strategy will be based on a distinctly American internationalism that reflects the union of our values and our national interests. The aim of this strategy is to help make the world not just safer but better. Our goals on the path to progress are clear: political and economic freedom, peaceful relations with other states, and respect for human dignity….To achieve these goals, the United States will:

• champion aspirations for human dignity;
• strengthen alliances to defeat global terrorism and work to prevent attacks against us and our friends;
• work with others to defuse regional conflicts;
• prevent our enemies from threatening us, our allies, and our friends, with weapons of mass destruction;
• ignite a new era of global economic growth through free markets and free trade;
• expand the circle of development by opening societies and building the infrastructure of democracy;
• develop agendas for cooperative action with other main centers of global power; and
• transform America's national security institutions to meet the challenges and opportunities of the twenty-first century." (**White House**, *The National Security Strategy of the United States of America*, September 2002, pp. 7-8)

National Security Strategy (NSS) of the United States: "Our national security strategy is founded upon two pillars:

"The first pillar is promoting freedom, justice, and human dignity – working to end tyranny, to promote effective democracies, and to extend prosperity through free and fair trade and wise development policies. Free governments are accountable to their people, govern their territory effectively, and pursue economic and political policies that benefit their citizens. Free governments do not oppress their people or attack other free nations. Peace and international stability are most reliably built on a foundation of freedom.

"The second pillar of our strategy is confronting the challenges of our time by leading a growing community of democracies. Many of the problems we face – from the threat of pandemic disease, to proliferation of weapons of mass destruction, to terrorism, to human trafficking, to natural disasters – reach across borders. Effective multinational efforts are essential to solve these problems. Yet history has shown that only when we do our part will others do theirs. America must continue to lead. (**President George W. Bush**, Introduction, *The National Security Strategy of the United States of America*, White House: March 2006)

National Security Telecommunications Advisory Committee (NSTAC): "The NSTAC provides industry-based advice and expertise to the President on issues and problems related to implementing National Security and Emergency Preparedness (NS/EP) communications policy. The NSTAC is comprised of up to 30 industry chief executives representing the major communications and

network service providers and information technology, finance, and aerospace companies. It was created under Executive Order 12382." (**DHS**, *NIPP*, 2006, p. 28).

National Security University (NSU): "Challenges of the 21st Century require a seamless response by the USG, and because emerging threats stretch outside of traditional military and diplomatic response mechanisms, educating the interagency community in strategic thinking, planning, and coordination is essential in building USG capabilities to meet the demands of a changing world. This Requires:

- An educated federal executive branch who understands the competencies and capabilities of others in the interagency community
- An understanding of how effective plans are developed and carried to fruition
- The ability to think strategically in order to adapt to an ever-changing global landscape." (**Blank/ITEA**, *National Security University: Concept and Progress*, NDU, 8 Nov 06, 2)

National Security University (NSU): "By 30 June 2006, the Under Secretary of Defense for Policy, in coordination with the Chairman, shall present to the Deputy Secretary a concept brief for establishing an expanded **National Security University (NSU)**, to include:

> A progress report on the congressionally mandated study outlined in section 583 of the 2006 National Defense Authorization Act
> Professional military education and curriculum design considerations; language and cultural awareness education
> Relationships among NSU and other educational and outreach institutions, both US Government-operated and private
> Factors relating to student matriculation, retention, and placement
> Efforts to ensure cost-sharing among sponsoring and participating organizations
> DOD command and control relationships and arrangements."
> (**DoD**, *Building Partnership Capacity: Quadrennial Defense Review Execution Roadmap*, May 22, 2006, p. 9)

National Security University (NSU): ". . . The Department will also transform the National Defense University, the Department's premier educational institution, into a true National Security University. Acknowledging the complexity of the 21st century security environment, this new institution will be tailored to support the educational needs of the broader U.S. national security profession. Participation from interagency partners will be reshaped in ways that are consistent with a unified U.S. Government approach to national security missions, and greater interagency participation will be encouraged." (**DOD**, *QDR* 2006, p.79)

National Security University (NSU) Audience: "Federal employees initially; State and local, private industry, and USG contractors in the future." (**Blank/ITEA**, *NSU: Concept and Progress*, NDU, 8 Nov 06, 7)

National Security University (NSU) Mission Concept: "Prepare military and civilian national security professionals from the U.S. and other countries to evaluate national, homeland, and international security challenges through multidisciplinary education and research programs,

professional exchanges and outreach." (**Blank/ITEA**, *NSU: Concept and Progress*, NDU, 8 Nov 06, 6)

National Security University (NSU)Vision Concept: "The National Security University will be the pre-eminent institution and/or consortium for learning, research, and outreach in national, homeland, and international security." (**Blank/ITEA**, *NSU: Concept and Progress*, NDU, 8 Nov 06, 6)

National Shelter System: "The National Shelter System (NSS) is a comprehensive database that provides relevant information for all shelters operated and reported through the NSS during response to disasters and emergencies. The information in the NSS is provided by the State, tribal, local, and nongovernmental entities that are operating these shelters." (**DHS**, *National Response Framework Emergency Support Function #6 – Mass Care, Emergency Assistance, Housing, and Human Services Annex* (Comment Draft), September 10, 2007, p. 6)

National Shelter System: "In an effort to improve shelter management and accountability, FEMA and the American Red Cross developed the National Shelter System (NSS). The NSS is a web-based data system that supports shelter management, reporting, and facility identification activities. The system is intended for use by all agencies that provide shelter services during disasters to ensure a comprehensive understanding of the shelter populations and available shelter capacity. In addition, the system provides visibility on large shelter populations and positions FEMA to deliver targeted registration assistance to disaster victims." (**FEMA**, *Statement of Glenn Cannon*, December 4, 2007, p. 6)

National Shelter System Policy (1952): "…the policy of the Federal Civil Defense Administration…briefly…is this:

First, that a survey be made, block by block, house by house, in all the more critical target areas, particularly within a community in those subareas which are industrial, institutinal, or commercial in nature. In other words where there is the greatest density of population during certain hours of the day. That survey will bring about an understanding of how many places, how many actual structures, can be used without any modification in order to afford at least fairly adequate shelter.

Second, it will show those shelters which with some modification can be considered as fairly adequate. After we have discovered those areas and how many people can be sheltered, based on a rule of thumb of six square feet per person, we will arrive at our deficit; e will then recommed that new shelters be built for those people." (**Wadsworth**, *The National Civil Defense Plan*, 1952, 13)

National Simulation Exercise Center: Component of FEMA's National Preparedness Directorate, National Integration Center, National Exercise Division, 2007.

National Special Security Event (NSSE): "When an event is designated a National Special Security Event, the Secret Service assumes its mandated role as the lead federal agency for the design and implementation of the operational security plan and Federal resources are deployed to maintain the level of security needed for the event and the area. The goal of such an operation is

to prevent terrorist attacks and criminal acts…. A number of factors are taken into consideration when designating an event as a National Special Security Event including a few outlined below:

1. Anticipated attendance by dignitaries - Events which are attended by officials of the United States Government and/or foreign dignitaries also may create an independent federal interest in ensuring that the event transpires without incident and that sufficient resources are brought to bear in the event of an incident.

2. Size of the event - A large number of attendees and participants generally increases the security requirements. In addition, larger events are more likely to draw the attention of terrorists or other criminals, particularly those interested in employing weapons of mass destruction.

3. Significance of the event - Some events have historical, political and/or symbolic significance that may heighten concern about possible terrorist acts or other criminal activity. (**DHS**, *National Special Security Events Fact Sheet*, July 9, 2003)

National Special Security Event Support (NSSE): "A designated event that, by virtue of its political, economic, social, or religious significance, may be the target of terrorism or other criminal activity."

- An event of great magnitude and enormous national and/or international importance
- Designated by the Secretary of Homeland Security (at the request of a Governor and recommendation of the NSSE Working Group)
- USSS [US Secret Service] leads the development and implementation of the comprehensive security planning for the event
- FBI serves as the lead for intelligence, criminal investigation of terrorist acts and threats, hostage rescue, and counterterrorism
- Other Federal Departments and Agencies will usually provide (pre-deployed and on standby) a full range of resources to support USSS, FBI and FEMA to achieve the highest level of readiness during the event
- A Principal Federal Official (PFO) is pre-designated for all NSSEs
- Integrated Federal Support Plan (IFSP) is required for all SEAR [Special Event Assessment Report] Level 1 & 2 events." (**DHS**, *Office of Operations Coordination Interagency Planning Workshop*, November 29, 2007, slide # 25)

National Special Security Event Support (NSSE): "NSSEs are events of national significance that require greater federal visibility. NSSE is a designation that was established by PDD 62 and HSPD-7 (which supersedes the language in the PDD) and provides for additional federal resources in Historical examples of NSSEs include the State of the Union Address, Salt Lake City Olympics, and Democratic and Republican National Conventions. support of state and local authorities. If DOD assistance is required, military forces will remain in a supporting role to the LFA. The Secretary of Homeland Security, in consultation with the HSC, shall be responsible for designating events as NSSEs. The USSS, an element of the DHS, is the LFA for NSSE-designated events. Special events, including NSSEs, are ranked in importance by the FBI." (**JCS/DoD**, *Homeland Security* (JP 3-26), 2005, pp. IV-6 and IV-7)

National Special Security Event (NSSE): "A designated event that, by virtue of it's political,

economic, social, or religious significance, may be the target of terrorism or other criminal activity." (**USCG**, *IM Handbook*, 2006, Glossary 25-17)

National Standard Exercise Curriculum (NSEC): "The National Standard Exercise Curriculum (NSEC) is working to unify exercise curriculum for coursework in exercise program management, design, development, conduct, evaluation, and improvement planning among Federal, State, Territorial, Tribal, and local partners. The National Standard Exercise Curriculum will reflect the broad collaboration and consistency within and across Departments, agencies, and levels of government espoused by the National Preparedness Goal, related Presidential Directives and the National Exercise Plan (NEP). Additionally, the curriculum will provide guidance to State and local jurisdictions concerning exercise training and ensure established policy is reinforced, corroborated, and institutionalized through education and training.
The following major objectives of the curriculum development process will be accomplished with the advice of the working group and the consent of the policy development committee:

- Establish planning guidance to align coursework into a national standardized exercise curriculum
- Ensure consistency across all exercise training curricula in accordance with the National Incident Management System (NIMS) and National Preparedness Goal
- Shape future efforts in exercise training and course development
- Integrate the Homeland Security Exercise and Evaluation Program (HSEEP) into the Master Exercise Practitioner (MEP) Program." (**FEMA**, *National Exercise Division, HSEEP*, *Quarterly Newsletter*, Spring 2008, p. 4)

National Standardized Exercise Curriculum (NSEC): "The National Standardized Exercise Curriculum (NSEC) is a current effort to unify curriculum in exercise program management, design, development, conduct, evaluation and improvement planning across the country. The NSEC strategy involves providing guidance to State and local jurisdictions concerning the exercise and training curricula, workshops and briefings." (**FEMA**, *NSEC*, 2008.)

National Strategy for Combating Terrorism: "As laid out in this strategy, to win the War on Terror, we will:

- Advance effective democracies as the long–term antidote to the ideology of terrorism;
- Prevent attacks by terrorist networks;
- Deny terrorists the support and sanctuary of rogue states;
- Deny weapons of mass destruction to rogue states and terrorist allies who seek to use them;
- Deny terrorists control of any nation they would use as a base and launching pad for terror; and
- Lay the foundations and build the institutions and structures we need to carry the fight forward against terror and help ensure our ultimate success." (**White House**, *National Strategy for Combating Terrorism*, 2006, p. 1)

National Strategy for Homeland Security (2002): "The *National Strategy for Homeland Security*… creates a comprehensive plan…to enhance our protection and reduce our vulnerability to terrorist attacks…. The strategic objectives of homeland security in order of priority are to:

• Prevent terrorist attacks within the United States;
• Reduce America's vulnerability to terrorism; and
• Minimize the damage and recover from attacks that do occur."
(**White House**, *National Strategy for Homeland Security*, 2002, pp. vi-vii)

National Strategy for Homeland Security (2002) Critical Mission Areas: "The *National Strategy for Homeland Security* aligns and focuses homeland security functions into six critical mission areas:

- intelligence and warning,
- border and transportation security,
- domestic counterterrorism,
- protecting critical infrastructure,
- defending against catastrophic terrorism, and
- emergency preparedness and response.

The first three mission areas focus primarily on preventing terrorist attacks; the next two on reducing our Nation's vulnerabilities; and the final one on minimizing the damage and recovering from attacks that do occur. The *Strategy* provides a framework to align the resources of the federal budget directly to the task of securing the homeland." (**White House**, *National Strategy for Homeland Security*, 2002, pp. viii)

National Strategy for Homeland Security (Emergency Preparedness and Support) 2002: The *National Strategy for Homeland Security* identifies twelve major initiatives in [Emergency Preparedness and Support]:
• Integrate separate federal response plans into a single all-discipline incident management plan;
• Create a national incident management system;
• Improve tactical counterterrorist capabilities;
• Enable seamless communication among all responders;
• Prepare health care providers for catastrophic terrorism;
• Augment America's pharmaceutical and vaccine stockpiles;
• Prepare for chemical, biological, radiological, and nuclear decontamination;
• Plan for military support to civil authorities;
• Build the Citizen Corps;
• Implement the First Responder Initiative of the Fiscal Year 2003 Budget;
• Build a national training and evaluation system; and
• Enhance the victim support system." (**White House**, *National Strategy for HS*, **2002**, p. x.)

National Strategy for Homeland Security -- Goal (2007): "The United States, through a concerted national effort that galvanizes the strengths and capabilities of Federal, State, local, and Tribal governments; the private and non-profit sectors; and regions, communities, and individual citizens – along with our partners in the international community – will work to achieve a secure Homeland that sustains our way of life as a free, prosperous, and welcoming America.

In order to realize this vision, the United States will use all instruments of national power and influence – diplomatic, information, military, economic, financial, intelligence, and law enforcement – to achieve our goals to prevent and disrupt terrorist attacks; protect the American people, critical infrastructure, and key resources; and respond to and recover from incidents that do occur. We also will continue to create, strengthen, and transform the principles, systems, structures, and institutions we need to secure our Nation over the long term. This is our strategy for homeland security." (**White House**, *National Strategy for Homeland Security*, 2007, page 13)

National Strategy for Homeland Security -- Purpose (2007): "The purpose of our *Strategy* is to guide, organize, and unify our Nation's homeland security efforts. It provides a common framework by which our entire Nation should focus its efforts on the following four goals:

• Prevent and disrupt terrorist attacks;
• Protect the American people, our critical infrastructure, and key resources;
• Respond to and recover from incidents that do occur; and
• Continue to strengthen the foundation to ensure our long-term success.

While the first three goals help to organize our national efforts, the last goal entails creating and transforming our homeland security principles, systems, structures, and institutions. This includes applying a comprehensive approach to risk management, building a culture of preparedness, developing a comprehensive Homeland Security Management System, improving incident management, better utilizing science and technology, and leveraging all instruments of national power and influence." (**White House**, *National Strategy for Homeland Security*, 2007,1)

National Strategy for Homeland Security – Shared Responsibility (2007): "To best protect the American people, homeland security must be a responsibility shared across our entire Nation. As we further develop a national culture of preparedness, our local, Tribal, State, and Federal governments, faith-based and community organizations, and businesses must be partners in securing the Homeland." (President George W. Bush, in **White House**, *National Strategy for Homeland Security*, 2007, p. 5, web copy)

National Strategy for Information Sharing: "Improving information sharing in the post–September 11 world requires an environment that supports the sharing of information across all levels of government, disciplines, and security domains. As with our achievements to date, an improved information sharing environment will not be constructed overnight, but rather will evolve over time and will be the fruit of careful cultivation. An improved information sharing environment also will be constructed upon a foundation of trusted partnerships among all levels of government, the private sector, and our foreign allies—partnerships based on a shared commitment to detect, prevent, disrupt, preempt, and mitigate the effects of terrorism. This Strategy sets forth the Administration's vision of what improvements are needed and how they can be achieved.

"The Strategy was developed with the understanding that homeland security information, terrorism information, and law enforcement information related to terrorism can come from multiple sources, all levels of government, as well as from private sector organizations and foreign sources. Federal, State, local, and tribal government organizations use such information

for multiple purposes. In addition to traditional law enforcement uses, such information is used to (1) support efforts to prevent terrorist attacks, (2) develop critical infrastructure protection and resilience plans, (3) prioritize emergency management, response, and recovery planning activities, (4) devise training and exercise programs, and (5) determine the allocation of funding and other resources for homeland security-related purposes." (**White House**, *National Strategy for Information* Sharing, October 2007, p. 1)

National Strategy for Information Sharing, Core Principles and Understandings: "The *Strategy* is founded on the following core principles and understandings:

- Effective information sharing comes through strong partnerships among Federal, State, local, and tribal authorities, private sector organizations, and our foreign partners and allies;
- Information acquired for one purpose, or under one set of authorities, might provide unique insights when combined, in accordance with applicable law, with unrelated information from other sources, and therefore we must foster a culture of awareness in which people at all levels of government remain cognizant of the functions and needs of others and use knowledge and information from all sources to support counterterrorism efforts;
- Information sharing must be woven into all aspects of counterterrorism activity, including preventive and protective actions, actionable responses, criminal and counterterrorism investigative activities, event preparedness, and response to and recovery from catastrophic events;
- The procedures, processes, and systems that support information sharing must draw upon and integrate existing technical capabilities and must respect established authorities and responsibilities; and
- State and major urban area fusion centers represent a valuable information sharing resource and should be incorporated into the national information sharing framework, which will require that fusion centers achieve a baseline level of capability to gather, process, share, and utilize information and operate in a manner that respects individuals' privacy rights and other legal rights protected by U.S. laws." (**White House**, *National Strategy for Information Sharing*, 2007, pp. 2-3)

National Strategy for Information Sharing, Foundational Elements: "This Strategy is focused on improving the sharing of homeland security, terrorism, and law enforcement information related to terrorism within and among all levels of governments and the private sector.

- Information Sharing at the Federal level….
- Information Sharing with State, local, and Tribal Entities….
- Information Sharing with the private Sector….
- Sharing Information with Foreign Partners….
- Protecting information Privacy and other Legal Rights…." (**White House**, *National Strategy for Information* Sharing, October 2007, pp. 3-4)

National Strategy for Information Sharing, Guiding Principles: "Those responsible for combating terrorism must have access to timely and accurate information regarding those who

want to attack us, their plans and activities, and the targets that they intend to attack. That information guides our efforts to:

- Identify rapidly both immediate and long-term threats;
- Identify persons involved in terrorism-related activities; and
- Implement information-driven and risk-based detection, prevention, deterrence, • response, protection, and emergency management efforts." (**White House**, *National Strategy for Information* Sharing, October 2007, p. 2)

National Strategy for Maritime Security: "Designed to integrate and synchronize existing department-level strategies to ensure their effective and efficient implementation, as well as align all federal government maritime security programs and initiatives into a comprehensive and cohesive national effort." (**GAO**, *Maritime Security*, December 2007, p. 56)

National Strategy for Pandemic Influenza (NSPI): "The ***National Strategy for Pandemic Influenza*** guides our preparedness and response to an influenza pandemic, with the intent of (1) stopping, slowing or otherwise limiting the spread of a pandemic to the United States; (2) limiting the domestic spread of a pandemic, and mitigating disease, suffering and death; and (3) sustaining infrastructure and mitigating impact to the economy and the functioning of society." (**White House,** *National Strategy for Pandemic Influenza.* November 1, 2005)

National Strategy for Public Health and Medical Preparedness: "This directive [HSPD 21] establishes a National Strategy for Public Health and Medical Preparedness (Strategy), which builds upon principles set forth in *Biodefense for the 21st Century* (April 2004) and will transform our national approach to protecting the health of the American people against all disasters….

(5) This Strategy draws key principles from the *National Strategy for Homeland Security* (October 2007), the *National Strategy to Combat Weapons of Mass Destruction* (December 2002), and *Biodefense for the 21st Century* (April 2004) that can be generally applied to public health and medical preparedness. Those key principles are the following: (1) preparedness for all potential catastrophic health events; (2) vertical and horizontal coordination across levels of government, jurisdictions, and disciplines; (3) a regional approach to health preparedness; (4) engagement of the private sector, academia, and other nongovernmental entities in preparedness and response efforts; and (5) the important roles of individuals, families, and communities.

(6) Present public health and medical preparedness plans incorporate the concept of "surging" existing medical and public health capabilities in response to an event that threatens a large number of lives. The assumption that conventional public health and medical systems can function effectively in catastrophic health events has, however, proved to be incorrect in real-world situations. Therefore, it is necessary to transform the national approach to health care in the context of a catastrophic health event in order to enable U.S. public health and medical systems to respond effectively to a broad range of incidents.

(7) The most effective complex service delivery systems result from rigorous end-to-end system design. A critical and formal process by which the functions of public health and medical

preparedness and response are designed to integrate all vertical (through all levels of government) and horizontal (across all sectors in communities) components can achieve a much greater capability than we currently have.

(8) The United States has tremendous resources in both public and private sectors that could be used to prepare for and respond to a catastrophic health event. To exploit those resources fully, they must be organized in a rationally designed system that is incorporated into pre-event planning, deployed in a coordinated manner in response to an event, and guided by a constant and timely flow of relevant information during an event. This Strategy establishes principles and objectives to improve our ability to respond comprehensively to catastrophic health events. It also identifies critical antecedent components of this capability and directs the development of an implementation plan that will delineate further specific actions and guide the process to fruition." (**White House**, *Homeland Security Presidential Directive (HSPD-21), Subject: Public Health and Medical Preparedness*, October 18, 2007)

National Strategy for The Physical Protection of Critical Infrastructure and Key Assets: "Consistent with the *National Strategy for Homeland Security*, this document identifies a clear set of goals and objectives and outlines the guiding principles that will underpin our efforts to secure the infrastructures and assets vital to our public health and safety, national security, governance, economy, and public confidence. It provides a unifying structure, defines roles and responsibilities, and identifies major initiatives that will drive our near-term protection priorities. Most importantly, it establishes a foundation for building and fostering a cooperative environment in which government, industry, and private citizens can work together to protect our critical infrastructures and key assets.' (**White House**, *The National Strategy for The Physical Protection of Critical Infrastructure and Key Assets.*, Feb. 2003, p. 2, Letter from the President)

National Strategy to Combat Weapons of Mass Destruction: "Our National Strategy to Combat Weapons of Mass Destruction has three principal pillars:

> *Counterproliferation to Combat WMD Use*
> *Strengthened Nonproliferation to Combat WMD Proliferation*
> *Consequence Management to Respond to WMD Use*" (**WH**, *HSPD-4*, December 2002)

National Strategy to Combat Weapons of Mass Destruction: "The three pillars of the U.S. national strategy to combat WMD are seamless elements of a comprehensive approach. Serving to integrate the pillars are four cross-cutting enabling functions that need to be pursued on a priority basis: intelligence collection and analysis on WMD, delivery systems, and related technologies; research and development to improve our ability to respond to evolving threats; bilateral and multilateral cooperation; and targeted strategies against hostile states and terrorists." (**White House**, *National Strategy to Combat Weapons of Mass Destruction*, Dec. 2002, p. 2)

National Strategy to Secure Cyberspace: "The *National Strategy to Secure Cyberspace* is part of our overall effort to protect the Nation. It is an implementing component of the *National Strategy for Homeland Security* and is complemented by a *National Strategy for the Physical Protection of Critical Infrastructures and Key Assets*. The purpose of this document is to engage and empower Americans to secure the portions of cyberspace that they own, operate, control, or

with which they interact. Securing cyberspace is a difficult strategic challenge that requires coordinated and focused effort from our entire society, the federal government, state and local governments, the private sector, and the American people." (**White House**, *National Strategy to Secure Cyberspace*, February 2003)

National Strike Force (NSF): "The NSF consists of three strike teams established by DHS/USCG on the Pacific, Atlantic, and Gulf coasts. The strike teams can provide advice and technical assistance for oil and hazardous substances removal, communications support, special equipment, and services." (**USCG**, *IM Handbook*, 2006, Glossary 25-18)

National Targeting Center (NTS) (Customs and Border Protection, DHS): "…a 24/7 operational center that brings together personnel from numerous government agencies to detect and respond to persons arriving at U.S. ports of entry who are matches or potential matches on national terrorist watch lists." (**DHS**, *Fact Sheet: ICE Accomplishments in Fiscal Year 2006*, 30Oct06; **DHS**, *Statement by Secretary Tom Ridge, Port of Portland*, 4 May 2004)

National Technical Nuclear Forensics Center (Domestic Nuclear Detection Office, DHS): "Provides national-level stewardship, centralized planning and integration for an enduring national technical nuclear forensics capability." (**DHS**, *DNDO Organization*, October 2007)

National Teleregistration Center (NTC): "Promotes a nationwide toll-free telephone number (1-800-621-FEMA) or (1-800-621-3362) that applicants can use to apply for disaster assistance." (**FEMA**, *Disaster Basics* (IS-292), May 24, 2007 update, p. A-8 Glossary)

National Threat: "The absolute gravest threat is the struggle that we're in against radical Islamic extremism which can affect - if they prevail - our very existence." (**CNNMoney.com**, June 25, 2008)

National Tsunami Hazard Mitigation Program: "A coordinated national effort to assess tsunami threat, prepare community response, issue timely and effective warnings, and mitigate damage." "Primary goals of NTHMP are to: 1) raise awareness of the affected population; 2) develop integrated tsunami maps and models that can be used to develop improved warning guidance and evacuation maps; 3) improve tsunami warning systems; 4) incorporate tsunami planning into state and federal multi-hazard programs. Because tsunami mitigation is applicable beyond tsunamis and is integral to the nation's overall effort to reduce coastal losses and improve resilience, the mitigation capability takes a multi-hazards physical, commercial and ecological approach that responds to socio-economic and disaster management priorities." (Executive Office of the President. *About the National Tsunami Hazard Mitigation Program (NTHMP)*

National Urban Search & Rescue Response System: "As a result of a number of major emergencies including structural collapse both here and abroad over the last decade, the concept of urban search and rescue (USAR) has become increasingly recognized as an important element n integrated emergency response. These incidents include catastrophic earthquakes in California, the Philippines, and Soviet Armenia and structural collapses in Brownsville, Texas, and New York City. Following Hurricane Hugo the California Earthquake in 1989, both of which served to draw attention to the need for improved urban search and rescue capabilities and resources, the

Federal Emergency Management Agency (FEMA) undertook a major initiative to establish a National Urban Search and Rescue System.

"The initial goal of the FEMA program has been to establish 25 qualified USAR task forces placed strategically throughout the nation. These task forces provide the ability to respond to major incidents within a few hours of activation and offer a full range of capabilities in incident management; search; rescue; specialty medical care for entrapped patients; and technical disciplines including structural engineering, heavy equipment operation, hazardous materials and communications.

"In addition, au Advisory Committee on the National USAR System has been formed consisting of federal government experts, state and local officials, and the private sector to guide further development of the System and to serve as a forum for discussing issues and exchanging information related to urban search and rescue.

"To complement the efforts of the Federal Emergency Management Agency in Urban search and Rescue, the United States Fire Administration (USFA) has also initiated research and development and information dissemination efforts on USAR. Study reports are being produced for USFA under its "Investigation of Urban search and Rescue Incidents" program that will broaden the base of information available about USAR tactics, management and technology, and contribute to reducing the number and severity of casualties by highlighting the lessons learned, both the successes and the failures, from such operations in the past. The investigation reports, such as this one, provide detailed information about the magnitude and the incidents themselves; how the response to the incidents was carried out and managed; and the impact of these incidents on emergency responders and the emergency response systems in the community. The United States Fire Administration greatly appreciates the cooperation and information it is receiving from the fire service, county and state officials, and other emergency responders as this research progresses." (**FEMA**, *Urban Search and Rescue in the Santa Cruz Area Following the Loma Prieta Earthquake* (FA-124), November 1992, p. ii)

National Urban Search & Rescue Response System: "The National US&R Response System is a framework for structuring local emergency services personnel into integrated disaster response task forces. The 28 National US&R Task Forces, complete with the necessary tools, equipment, skills and techniques, can be deployed by FEMA to assist State and local governments in rescuing victims of structural collapse incidents or to assist in other search and rescue missions. Each task force must have all its personnel and equipment at the embarkation point within six hours of activation."

National Voluntary Organizations Active in Disasters (NVOAD): "NVOAD is a consortium of more than 30 recognized national organizations[91] active in disaster relief. Their organizations provide capabilities to support response efforts at all levels. During major incidents, NVOAD typically sends representatives to the DHS/Federal Emergency Management Agency's National Response Coordination Center to represent the voluntary organizations and assist in response coordination." (**DHS**, *NRF Comment Draft*, 2007, p. 17)

[91] Changed to "approximately 50 national organizations in Jan 2008 NRF, p. 21)

National Voluntary Organizations Active in Disasters (NVOAD): An umbrella organization of established and experienced voluntary organizations that serve disaster-affected communities. (**FEMA** 1995)

National Voluntary Organizations Active in Disasters (NVOAD): "NVOAD coordinates planning efforts by many voluntary organizations responding to disaster. Member organizations provide more effective and less duplication in service by getting together before disasters strike. Once disasters occur, NVOAD or an affiliated state VOAD encourages members and other voluntary agencies to convene on site. This cooperative effort has proven to be the most effective way for a wide variety of volunteers and organizations to work together in a crisis.

NVOAD serves member organizations through:

- Communication - disseminating information through electronic mechanisms, its Newsletter, the directory, research and demonstration, case studies, and critique.
- Cooperation - creating a climate for cooperation at all levels (including grass roots) and providing information.
- Coordination - coordinating policy among member organizations and serving as a liaison, advocate, and national voice.
- Education - providing training and increasing awareness and preparedness in each organization.
- Leadership Development - giving volunteer leaders training and support so as to build effective state VOAD organizations.
- Mitigation - supporting the efforts of federal, state, and local agencies and governments and supporting appropriate legislation.
- Convening Mechanisms - putting on seminars, meetings, board meetings, regional conferences, training programs, and local conferences.
- Outreach - encouraging the formation of and giving guidance to state and regional voluntary organizations active in disaster relief." (**National Voluntary Organizations Active in Disaster**, *About NOVAD*)

National Warning Control System (NAWAC): "Within the past few months, FCDA installed the National Warning Control System (NAWAC), for intercommunication or warning and tactical information through full-period telephone circuits connecting the FCDA Attack Warning Officers, Liaison Officers at CONAD and at the Air Defense Forces, FCDA regional offices, and the Administrator's office." (**FCDA,** *1955 Annual Report*, 1956, p. 4)

National Warning System (NAWAS):

- FEMA funds, operates, and controls
- Dedicated party-line voice system for emergency managers and military use
- NAWAS Regional Circuits
    - About 300 special telephone terminals in 10 FEMA regions
    - FEMA Operations Centers can call one or more regions
- NAWAS State Circuits:
    - About 1,700 telephone terminals
    - State Warning Point (SWP) serves as bridge to regional circuits. (**FEMA**, *IPAWS Update*, 2007, slide 19)

National Wildfire Coordinating Group (NWCG): "The National Wildfire Coordinating Group (NWCG) is made up of the USDA Forest Service; four Department of the Interior agencies: Bureau of Land Management (BLM), National Park Service (NPS), Bureau of Indian Affairs (BIA), and the Fish and Wildlife Service (FWS);and State forestry agencies through the National Association of State Foresters. The purpose of NWCG is to coordinate programs of the participating wildfire management agencies so as to avoid wasteful duplication and to provide a means of constructively working together. Its goal is to provide more effective execution of each agency's fire management program. The group provides a formalized system to agree upon standards of training, equipment, qualifications, and other operational functions." (NWCG, *About the NWCG – NWCG Organization*)

Nationwide Plan Review: "I believe all current issues can be summarized in one topic – communication. In my 19 years in emergency management, I have never experienced a more polarized environment between state and federal government. It seems that the Katrina federal legacy is one of minimizing exposure for the next event and ensuring future focus is centered on state and local preparedness efforts. A perfect example of this attitude is illustrated in the National Plan Review, which was conducted in 2006. The states were told that this was an opportunity for all levels of government to sit together, review plans, identify shortfalls, and develop a strategy to address those shortfalls, both operationally and financially in the future. This seemed like a wonderful concept, right up until the time the national planning report card was published for each state. The entire exercise seemed to be little more than an opportunity for the federal government to tell the press, "we told you states weren't prepared". (**Ashwood**, *Testimony… on "FEMA Preparedness in 2007 and Beyond,"* July 31, 2007, p. 2)

Nationwide Plan Review: "I am pleased to submit the Nationwide Plan Review Phase 2 report to Congress, as directed by the DHS FY 2006 Appropriations Act and the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU). This report meets Congressional requirements to review and assess the status of catastrophic and evacuation planning in all States and 75 of the Nation's largest urban areas. It also addresses the President's directive to review emergency operations plans (EOPs) for the Nation's major cities.

The Nationwide Plan Review consisted of two phases. The first phase involved selfassessment, in which each State and urban area certified the status of its EOP and identified when the plan was last updated and exercised. The findings from the selfassessment phase were provided to Congress on February 10, 2006. The second phase involved peer review, in which teams made up of former State and local homeland security and emergency management officials visited 131 States and urban areas. Over the course of 62 business days, these reviewers validated the self-assessments, determined requirements for Federal planning assistance, and drew initial conclusions for strengthening plans and planning processes at the Federal, State, and local levels of government for catastrophic events. (**DHS**, *NPR Phase 2 Report* (DHS Secretary Chertoff Introduction), 2006, p. v)

Nationwide Plan Review Key Findings and Initial Conclusions: "While the Review found exemplary planners, renewed emphasis on planning, and many initiatives that are on the right trajectory, the current status of plans and planning gives grounds for significant national concern.

Current catastrophic planning is unsystematic and not linked within a national planning system. This is incompatible with 21st century homeland security challenges, and reflects a systemic problem: outmoded planning processes, products, and tools are primary contributors to the inadequacy of catastrophic planning. The results of the Review support the need for a fundamental modernization of our Nation's planning processes." (**DHS**, *NPR* 2, 2006, p. viii) "The Nationwide Plan Review provided a rapid assessment of the status of catastrophic planning for States and 75 of the Nation's largest urban areas… the initial conclusions are summarized below. They are numbered for ease of reference, not prioritization….

For States and Urban Areas:

1. The majority of the Nation's current emergency operations plans and planning processes cannot be characterized as fully adequate, feasible, or acceptable to manage catastrophic events as defined in the National Response Plan (NRP).
2. States and urban areas are not conducting adequate collaborative planning as a part of "steady state" preparedness.
3. Assumptions in Basic Plans do not adequately address catastrophic events.
4. Basic Plans do not adequately address continuity of operations and continuity of government.
5. The most common deficiency among State and urban area Direction and Control Annexes is the absence of a clearly defined command structure.
6. Many States and urban areas need to improve systems and procedures for communications among all operational components.
7. All Functional Annexes did not adequately address special needs populations.
8. States should designate a specific State agency that is responsible for providing oversight and ensuring accountability for including people with disabilities in the shelter operations process.
9. Timely warnings requiring emergency actions are not adequately disseminated to custodial institutions, appropriate government officials, and the public.
10. The ability to give the public accurate, timely, and useful information and instructions through the emergency period should be strengthened.
11. Significant weaknesses in evacuation planning are an area of profound concern.
12. Capabilities to manage reception and care for large numbers of evacuees are inadequate.
13. Capabilities to track patients under emergency or disaster conditions and license of out-of-State medical personnel are limited.
14. Resource management is the "Achilles heel" of emergency planning. Resource Management Annexes do not adequately describe in detail the means, organization, and process by which States and urban areas will find, obtain, allocate, track, and distribute resources to meet operational needs.
15. Plans should clearly define resource requirements, conduct resource inventories, match available resources to requirements, and identify and resolve shortfalls."
(**DHS**, *NPR* 2, 2006, p. ix-x; see also, **DHS**, "Fact Sheet: Nationwide Plan Review Initial Conclusions," June 16, 2006.)

For the Federal Government:

1. Planning products, processes, tools, and technologies should be developed to facilitate a common nationwide approach to catastrophic planning in accordance with the National

Preparedness Goal's National Priority to Strengthen Planning and Citizen Preparedness Capabilities.
2. Planning modernization should be fully integrated with other key homeland security initiatives.
3. Clear guidance should be developed on how State and local governments plan for coordinated operations with Federal partners under the NRP.
4. Existing Federal technical assistance should be used to help States and urban areas address the specific issues identified during the Nationwide Plan Review.
5. Critical tasks, target capabilities, and associated performance measures, such as those identified in the National Preparedness Goal should serve as the common reference system for planning and the language of synchronization.
6. Detailed planning assumptions and planning magnitudes for catastrophic incidents should be defined, such as has been initiated through the National Planning Scenarios.
7. Current preparedness data should be readily accessible to planners.
8. Regional planning capabilities, processes, and resources should be strengthened in accordance with the National Preparedness Goal's National Priorities to Expand Regional Collaboration and Strengthen Planning and Citizen Preparedness Capabilities.
9. Collaboration between government and non-governmental entities should be strengthened at all levels, as outlined in the National Preparedness Goal's National Priority to Expand Regional Collaboration.
10. The Federal Government should develop a consistent definition of the term "special needs".
11. The Federal Government should provide guidance to States and local governments on incorporation of disability-related demographic analysis into emergency planning.
12. Federal, State, and local governments should work with the private sector to identify and coordinate effective means of transporting individuals with disabilities before, during, and after an emergency.
13. Improvements in public preparedness and emergency public information should be implemented in accordance with the National Preparedness Goal's National Priority to Strengthen Planning and Citizen Preparedness Capabilities.
14. Federal, State, and local governments should take action to better integrate nongovernmental resources to meet surge capacity.
15. The Federal Government should provide the leadership, doctrine, policies, guidance, standards, and resources necessary to build a shared national homeland security planning system.
16. Identification of desired technologies, tools, and architecture(s) for the national homeland security planning community should be included in the National Priority to Strengthen Planning and Citizen Preparedness Capabilities.
17. Comprehensive national guidance on the potential consequences associated with catastrophic risks and hazards should be developed to drive risk management and operational planning.
18. Development of focused training, education, and professional development programs for homeland security planners should be included in the National Priority to Strengthen Planning and Citizen Preparedness Capabilities.
19. Collaborative planning and planning excellence should be incentivized. Funding and projects should be linked to operational readiness through a specific task or capability in a plan or plan annex.

20. Federal, State, and local governments should increase the participation of people with disabilities and disability subject-matter experts in the development and execution of plans, training, and exercises.
21. The Federal Government should provide technical assistance to clarify the extent to which emergency communications, including public information associated with emergencies, must be in accessible formats for persons with disabilities. This assistance should address all aspects of communication, including, for example, televised and other types of emergency notification and instructions, shelter announcements, and applications and forms for government and private disaster benefits.
22. The status of the Nation's plans should be a central focus of the annual report to the President on the Nation's preparedness required by Homeland Security Presidential Directive 8 (HSPD-8)
23. Emergency Operations Plans should be a focal point for resource allocation, accountability, and assessments of operational readiness.
24. Performance management frameworks to support the National Preparedness Goal should measure the ability to:

- Integrate a multi-jurisdictional and multi-agency response based on the intersection of tasks and capabilities in combined plans; and
- Maintain operations in the face of disruptions of service, damage to the environment in which operations occur, or loss of critical resources."

(**DHS**, *NPR* 2, 2006, pp. x-xi; see, also, **DHS**, "Fact Sheet: Nationwide Plan Review Initial Conclusions," June 16, 2006.)

Natural Disaster: "Definitions - For purposes of this title only…. The term 'natural disaster' means any hurricane, tornado, storm, flood, high water, wind-driven water, tidal wave, tsunami, earthquake, volcanic eruption, landslide, mudslide, snowstorm, drought, fire, or other catastrophe in any part of the United States which causes, or which may cause, substantial damage or injury to civilian property or persons." (**Stafford Act**, Title VI, Sec 602. Definitions (42 U.S.C. 5195a), June 2007 (FEMA 592), p. 54)

Natural Disaster: "Strictly speaking, there is no such thing as a natural disaster, but there are natural hazards, such as cyclones and earthquakes … A disaster takes place when a community is affected by a hazard … In other words, the impact of the disaster is determined by the extent of a community's vulnerability to the hazard. This vulnerability is not natural. It is the human dimension of disasters, the result of the whole range of economic, social, cultural, institutional, political and even psychological factors that shape people's lives and create the environment that they live in." (**ISDR** *Living with Risk: A global review of disaster reduction initiatives*, 2004)

Natural Disaster: See "Disaster, Natural"

Natural Disasters and National Security Threats (1953): "Civil Defense as a Peacetime Disaster Agency: Dramatic examples of the value of civil defense in peacetime deisasters continued to accumulate during 1953. As civil defensse participation in recovery efforts after natural catastrophies increased, more and more people began to see that this new partner in national defense, essential as it woulde be in war, could also pay its way in peacetime.

At the Federal level, Executive Order 10427 issued on January 16, 1953, gave FCDA [Federal Civil Defense Administration] responsibility for providing assistance to localities stricken by major disasters. This responsibility involved investigating and evaluating natural disasters in the States and recommending to the President whether or not the disaster was of sufficient magnitude to warrant Federal aid. The order named FCDA the coordinating agency for all Federal assistance, when authorized, to stricken areas.

Tornadoes, floods, explosions, fires, and countless other emergency situatins across the Nation became the proving grounds for civil defense preparedness. In every case where civil defense workers were at the scene, their contribution to alleviation of the situation, whether of minor or major nature, was indisputable. In many cases civil defense's organization and ability to act quickly and constructively provided the impetus needed to start remedial action in the local disaster involved" (**FCDA**, *1953 Annual Report*, p. 15)

"The disasters of 1953 demonstrated that, although in an emergency people are willing and anxious to offer their help, they must have leadership, training, and organization to be of benefit. Civil defense can provide that leadership, training, and organization. The catastrophes of 1953 clearly showed that the same mena nd women who are organized, equipped, and trained to counteract an atomic blast can be effective on the homefrot in times of flood, earthquakes, tornadoes, and other natural disasters." (**FCDA**, *1953 Annual Report*, p. 17)

Natural Hazards: See "Hazard, Natural"

Natural Hazards Support System (NHSS): A hazards mapping system "designed to provide a comprehensive overview of current natural hazards events for the public as well as USGS Federal, State and local partners." (**DOI**, *Emergency Management*, 2008)

Naturalistic Decision Making (NDM): "Naturalistic Decision Making (NDM) is emerging as a field of research providing a descriptive view of how people make decisions in actual settings that often feature unstructured problems imbedded within complex and dynamic systems. Decision making in these settings tends to differ significantly from the analytic style inferred from structured laboratory decision tasks that form the basis for traditional decision theory research. A growing body of research indicates that under realistic conditions experts make decisions using a holistic process involving situation recognition and pattern matching to memory structures to make rapid decisions (Dreyfus, 1981; Klein, 1989, 1993; Klein, Calderwood, & Clinton-Cirocco, 1986). Within this framework, a person's situation awareness (SA), an internal conceptualization of the current situation, becomes the driving factor in the decision-making process. For novices as well, who may operate using very different decision strategies, understanding the situation frequently poses the major portion of their task. In most settings effective decision making largely depends on having a good understanding of the situation at hand." (**Endsley**, "The Role of Situation Awareness in Naturalistic Decision Making," Chapter 26, p. 269 in Zsambok, Caroline E., and Gary Klein (Eds.). *Naturalistic Decision Making*. Lawrence Erlbaum Associates, 1997, 414 pages.

Naturalistic Decision Making (NDM): "Naturalistic decision making is an attempt to understand how humans actually make decisions in complex real-world settings, such as fire fighting… This work has focused on situations marked by key features…These include dynamic

and continually changing conditions, real-time reactions to these changes, ill-defined tasks, time pressure, significant personal consequences for mistakes, and experienced decision makers. (**Klein and Klinger**, "Naturalistic Decision Making," 1991, p. 16)

Naturalistic Decision Making (NDM): "NDM is the way people use their experience to make decisions in field settings…. the processes and strategies of 'naturalistic' decision making differ from those revealed in traditional decision research. For example…in NDM, the focus in the decision event is more front-loaded, so that decision makers are more concerned about sizing up the situation and refreshing their situation awareness through feedback, rather than developing multiple options to compare to one another. In contrast, most traditional decision research has involved inexperienced people who are engaged in laboratory tasks where contextual or situational factors play a limited role. The traditional paradigm emphasizes understanding the back end of the decision event – choosing among options (Beach & Lipshitz, 1993)…. The study of NDM asks how experienced people, working as individuals or groups in dynamic, undertain, and often fast-paced environments, identify and assess their situation, make decisions and take actions whose consequences are meaningful to them and to the larger organization in which they operate." (**Zsambok**, "Naturalistic Decision Making…, 1997, p. 4)

Need to Know: "A determination made by an authorized holder of classified information that disclosure/dissemination of the information to an appropriately cleared individual is required in order to permit that individual to perform their official duties. The determination is not made solely by virtue of an individual's office, position, or security clearance level." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, p. 38)

Need to Know vs. Need to Share: "… What all these stories have in common is a system that requires a demonstrated "need to know" before sharing. This approach assumes it is possible to know, in advance, who will need the information. Such a system implicitly assumes that the risk of inadvertent disclosure outweighs the benefits of wider sharing. Those Cold War assumptions

are no longer appropriate. The culture of agencies feeling they own the information they gathered at taxpayer expense must be replaced by a culture in which the agencies instead feel they have a duty to the information—to repay the taxpayers' investment by making that information available... Current security requirements nurture over-classification and excessive compartmentalization of information among agencies. Each agency's incentive structure opposes sharing, with risks (criminal, civil, and internal administrative sanctions) but few rewards for sharing information. No one has to pay the long-term costs of over-classifying information, though these costs—even in literal financial terms— are substantial. There are no punishments for *not* sharing information. Agencies uphold a "need-to-know" culture of information protection rather than promoting a "need-to-share" culture of integration." (*The 9/11 Commission Final Report on Terrorist Attacks upon the United States*, p.417' quoted in: ." (**DHS**, *Capstone Doctrine Pub 1 Version 2.1 Draft*, Chapter 8, Information Operations, 2008, p. 8-3)

Need to Share: "DHS was created to facilitate information sharing across governments and the private sector. It is a function of both operating practices and technologies that enable information to be shared quickly and securely, as well as a culture that supports information sharing. The Nation's intelligence and information sharing systems must go from being closed, mission-centric loops utilized only within government agencies to a new nation-wide culture and network of information sharing, fusion, and interagency collaboration. This requires replacing the Nation's old "Need to Know" way of sharing information with a new "Need to Share" culture."(**DHS**, *Capstone Doctrine Pub 1 Version 2.1 Draft*, Chapter 8, Information Operations, 2008, p. 8-3)

NEEP: National Exercise and Evaluation Program. **(HSC**, *NCPIP*, August 2007, p. 65)

NEHC: Neighborhood Emergency Health Center. (**AHRQHHS**, *Mass Medical Care*, 2007, 77)

NEHRP: National Earthquake Hazard Reduction Program.

NEHRP Goals (From Strategic Plan): "…strategic goals are:
• Goal A. Develop effective practices and policies for earthquake loss-reduction and accelerate their implementation.
• Goal B. Improve techniques to reduce vulnerability of facilities and systems.
• Goal C. Improve seismic hazards and risk assessment methods.
• Goal D. Improve understanding of earthquakes and their effects." (**NEHRP**, *Annual Report*, 2007, p. 3)

NEHRP Program Coordination Working Group (PCWG): "NIST has established the PCWG, which is composed of the working-level program managers from each of the NEHRP agencies. The PCWG meets approximately once a month to coordinate agency activities, review

reporting and planning documents, discuss problems and opportunities, and exchange relevant information. The PCWG members are responsible for keeping their agencies' Directors apprised of significant activities, and the Secretariat informs working-level counterparts at OSTP and OMB of these activities." (**NEHRP**, *Annual Report*, 2007, p. 3)

NEHRP Secretariat: "In early 2006, NIST hired a full-time government employee as NEHRP Director and head of the office of the NEHRP Secretariat. This individual is a qualified engineer with experience in earthquake research, design, and construction practices, and in the management of complex programs and organizations. The office of the NEHRP Secretariat is charged with providing overall program management and coordination for NEHRP, strengthening program effectiveness by facilitating implementation of earthquake risk mitigation measures, ensuring that NEHRP statutory and reporting requirements are met, supporting the development and implementation of NEHRP strategic and management plans and coordinated interagency budgets, and building and maintaining effective liaison with NEHRP program agencies, industry stakeholders, academia, state and local government, and the general public." (**NEHRP**, *Annual Report*, 2007, p. 3)

NEPP: National Emergency Preparedness Program, United States Army Corps of Engineers. (**USACE**, *NEPP*)

NERRTC: National Emergency Response and Rescue Training Center. (**FEMA**, *TEI/TO Course Catalog*, 2008, 5)

Nerve Agents: "Substances that interfere with the central nervous system. Exposure is primarily through contact with the liquid (via skin and eyes) and secondarily through inhalation of the vapor. Tabun (GA), Sarin (GB), Soman (GD) and VX are nerve agents. Symptoms: Pinpoint pupils, extreme headache, severe tightness in the chest, dyspnea, runny nose, coughing, salivation, unresponsiveness, seizures." (**DOT**, *Emergency Response Guidebook*, 2004, p. 362)

NEST: Nuclear Emergency Search Team, DOE.

Net Guard: National Emergency Technology Guard. (**FEMA** *News Release HQ-08-112*, 2008)

NETC: National Emergency Training Center, FEMA/DHS, Emmitsburg, MD.

Net-Centricity: "People, processes, and technology working together to enable timely and trusted:

- Access to information
- Sharing of information
- Collaboration among those who need it.

Can only be done on the Net!" (**DOD**, *Enabling Net-Centric Operations*, Sep 21, 2006, slide 6)

New FEMA: "The Post-Katrina Emergency Management Reform Act reorganizes DHS by reconfiguring FEMA with consolidated emergency management functions, including national preparedness functions. The newly-constituted FEMA will be established as a distinct entity, yet integral to DHS, similar to the U.S. Coast Guard and U.S. Secret Service. As required by the Act, the New FEMA will include the functions existing within FEMA as of June 1, 2006 and those elements of the Preparedness Directorate that were in the Preparedness Directorate as of June 1, 2006 and not specifically excluded by the Act. The New FEMA will be headed by an Administrator, I have been asked to serve in the newly titled position of Administrator. As required by the Post-Katrina Act, the organizational changes required for New FEMA will be effective on March 31, 2007." (**FEMA**, *Statement for the Record R. David Paulison*, February 28, 2007, pp. 2-3)

New FEMA: "FEMA's vision sets a future path to building a dynamic and innovative New FEMA using the building blocks of strengthened core competencies, regions, and partnerships; investments in FEMA employees; a business approach that achieves desired results; and, the professionalization of the national emergency management system." (**FEMA**, *Strategic Plan*, 2007, p. 43)

New Madrid Seismic Zone (NMSZ): "The New Madrid Seismic Zone (NMSZ) is a fault system in the Central U.S. that is located roughly between St. Louis, Missouri and Memphis, Tennessee. The geology in the Central U.S. is conducive to movement, and potential damage is more widespread than other earthquake-prone areas of the U.S. The series of earthquakes with the greatest magnitude in the area was in 1811-12 (4 major quakes within 3 months, ranging from approximately 7.0 to 8.0 in magnitude.) There appears to be a 400-500 year cycle of earthquakes in the region – some debate on this – but a serious consideration (we are at 195 years since last significant series)…. The Central United States Earthquake Consortium (CUSEC), the Mid-America Earthquake Center (MAEC), the United States Geological Survey (USGS) and FEMA have completed preliminary modeling of potential impacts of an earthquake in the NMSZ. The estimated total building loss alone in the area from one quake today could exceed $70 Billion." (**FEMA**, *New Madrid Seismic Zone Catastrophic Planning*, 2007)

New Madrid Seismic Zone (NMSZ) Catastrophic Response Planning Initiative: "The New Madrid Seismic Zone Catastrophic Response Planning Initiative is well underway throughout the eight CUSEC Member States…the initiative will enable local, state, and federal agencies to create and adopt comprehensive plans that address responding to a catastrophic event along the

New Madrid Seismic Zone. CUSEC, along with Member States, FEMA, Innovative Emergency Management, and the Mid America Earthquake Center, is helping to coordinate a series of local and state workshops that bring together key players in the planning process. The workshops are scenario-driven and inspire planners and responders to work together to come up with the plans. Arkansas is the first state holding the scenario-driven workshops, and all Member States will have completed their workshops by April 1, 2008. At the end of this multi-year initiative, there will be a series of exercises, at the state and regional levels, that will help validate the work that has been done. In most terms, this is the single, largest disaster planning initiative that has been undertaken in the United States." (**CUSEC**, "Catastrophic Planning Initiative Underway." Memphis, TN: *CUSEC News*, July 2007)

New Madrid Seismic Zone (NMSZ) Catastrophic Response Planning Initiative: "The NMSZ Catastrophic Disaster Response Planning Initiative was selected as a venue to address one of the 15 National Planning Scenarios, "natural disasters-major earthquake" as identified in the National Preparedness Guidelines dated September 2007. The NMSZ Catastrophic Disaster Response Planning Initiative focuses on a "no-notice" major earthquake along the NMSZ. The NMSZ Initiative uses a bottoms-up, grass-roots planning approach with broad stakeholder participation that will help ensure comprehensive plan development, plan enhancements, and a sustainable planning process." (**FEMA**, *Statement of Glenn Cannon*, December 4, 2007, p. 2)

"Project briefed to President, Secretary DHS, Capital Hill Senate and House Members and Staff, US Chamber of Commerce, Delta Regional Authority, International Development Group, National Hurricane Conference…" (**FEMA**, *Catastrophic Disaster Planning IAEM Presentation*, November 12, 2007, slide 43)

New Madrid Seismic Zone (NMSZ) Catastrophic Planning Initiative Mission: "…the mission of the New Madrid Seismic Zone Catastrophic Planning Project is to create a comprehensive preparedness plan for a catastrophic earthquake in the NMSZ based on the most advanced impact assessment techniques and new response and recovery methodologies. Another mission of the project is to identify any issues that can not be resolved based on current capabilities and propose recommended courses of action for decision makers." (**CUSEC**, "FEMA & CUSEC Launch New Madrid Catastrophic Planning Initiative," January 2007, 1 & 3)

New Madrid Seismic Zone (NMSZ) Catastrophic Planning Project Mission: "The mission of the New Madrid Seismic Zone Catastrophic Planning Project is to increase national readiness for a catastrophic earthquake in the NMSZ. Specifically, this will be accomplished by developing a series of annexes or supplements to existing base plans for response and recovery to a series of major earthquakes in the NMSZ and integrating them into a single document with federal, regional, tribal, state, and local components. Additionally, the mission is to identify any issues that can not be resolved based on current capabilities and to propose recommended courses of action for decision makers involved in this project. The NMSZ Catastrophic Planning project will serve to accomplish the following three main objectives:
1. Improve response to a catastrophic earthquake and related hazards in the NMSZ
2. Plan for a coordinated response and recovery effort among Federal, State, and local agencies
3. Incorporate lessons from the Hurricane Katrina response, Southeast Louisiana Catastrophic Hurricane Plan, and previous earthquakes." (**FEMA**, *NMSZ Catastrophic Planning*, 2007)

NEXS: National Exercise Schedule, National Exercise Program. (**FEMA,** *Statement of Schrader*, 2007, p. 7)

NEXS System: "The NEXS System is the Nation's online comprehensive tool that facilitates scheduling, de-confliction, and synchronization of all exercises in a centralized location. The NEXS System allows users to schedule exercises online, in addition to de-conflicting and synchronizing with exercises that are similar in date and location, scope, scenario, or participants. Exercise synchronization, the coordination and possible linking or combining of exercises, facilitates better allocation of resources and limits potential exercise fatigue. **(DHS,** *Homeland Security Exercise and Evaluation Program Toolkit -- The NEXS*, Sep. 13, 2007)

NFG: Non-Federal Governments. (**DHS**, *FCD 1*, November 2007, p. O-2)

NFIF: National Flood Insurance Fund.

NFIP: National Flood Insurance Program, FEMA.

NFIRA: National Flood Insurance Reform Act of 1994. (**FEMA**, *Call for Issues*…, 2000, xxiii)

NFIRS: National Fire Incident Reporting System, United States Fire Administration, FEMA.

NFP: National Fire Programs, United States Fire Administration, FEMA.

NFPA: National Fire Protection Association.

NFPA 471: Recommended Practice for Responding to Hazardous Materials Incidents 1997 Ed.

NFPA 472: Standard for Professional Competence of Responders to Hazardous Materials Incidents.

NFPA 1201: Standard for Providing Emergency Services to the Public.

NFPA 1500: Standard on Fire Department Occupational Safety and Health Program.

NFPA 1521: Standard for Fire Department Safety Officer. National Fire Protection Association.

NFPA 1561: Standard on Emergency Services Incident Management Systems, 2002. "There were several efforts to "blend" the various incident command systems. One early effort was in 1987 when the National Fire Protection Association (NFPA) undertook the development of NFPA 1561, then called Standard on Fire Department Incident Management System. The NFPA

committee quickly recognized that the majority of the incident command systems in existence at the time were similar. The differences among the systems were mostly due to variations in terminology for similar components. That NFPA standard, later revised to its present title: Standard on Emergency Services Incident Management, provides for organizations to adopt or modify existing systems to suit local requirements or preferences as long as they meet specific performance measurements." (**FEMA**, *NIMS and ICS*, 2004)

NFPA 1581: Standard on Fire Department Infection Control Program.

NFPA 1582: Standard on Comprehensive Occupational Medical Program for Fire Departments.

NFPA 1600: "NFPA 1600, *Standard on Disaster/Emergency Management and Business Continuity Programs***,** was originally published in 1995 as a recommended practice, then in 2000, it was published as a standard…. The 9/11 Commission asked the American National Standards Institute (ANSI) to develop a consensus on a 'National Standard for Preparedness' for the private sector. ANSI's Homeland Security Standards Panel recommended the use of NFPA 1600. The recognition of NFPA 1600 by the 9/11 Commission led to the recognition of NFPA 1600 in Title VII, Section 7305 of the 'National Intelligence Reform Act of 2004'." (**NFPA**, *Implementing NFPA 1600 National Preparedness Standard*, 2007, p. xiii)

NFPA 1600: *Standard on Disaster/Emergency Management and Business Continuity Programs***,** 2007 Edition. National Fire Protection Association. NFPA 1600 "was prepared by the Technical Committee on Emergency Management and Business Continuity. It was issued by the Standards Council on December 1, 2006, with an effective date of December 20, 2006, and supersedes all previous editions. This edition of NFPA 1600 was approved as an American National Standard on December 20, 2006. (**NFPA**, *NFPA 1600*, 2007, p. 4)

1.1 Scope. This standard shall establish a common set of criteria for disaster/emergency management and business continuity programs hereinafter referred to as the program.
1.2 Purpose. This standard shall provide disaster and emergency management and business continuity programs, the criteria to assess current programs or to develop, implement, and maintain aspects for prevention, mitigation, preparation, response, and recovery from emergencies.
1.3 Application. This document shall apply to public, not-for-profit, and private entities. (**NFPA 1600**, 2007, p. 7)

NFPA 1600 Background: "The NFPA Standards Council originally established a "Disaster Management" Committee in 1991 to develop preparedness, response and recovery guidelines for disasters…. The NFPA 1600 development process closely paralleled the development of the Federal Emergency Management Agency's (FEMA) "Capabilities Assessment for Readiness" (CAR) document. ERI International's "Blueprint for Community Emergency Management" was a source document for this original version of the standard. ERI President, Rick LaValla was instrumental in both the development of the first NFPA 1600 standard and the "Operational Readiness and Capability Assessment" which later became known as CAR. In preparation for issuing the 2000 edition of NFPA 1600, the committee took a much broader "total program approach" and incorporated elements of three related fields: disaster management, emergency

management, and business continuity programs. The committee expanded the standard to include activities both before and after a disaster, so that mitigation activities are included as part of the effort to protect life and property. In addition, business continuity and disaster recovery practitioners were involved.

"Mr. LaValla stated that he was engaged by FEMA in 1996 to assist with the development of a national preparedness survey of state emergency management agencies that would result in a report to Congress. Mr. LaValla says "ERI was selected because of a long history with developing emergency management program "blueprints," and assessment methodologies. ERI had also just completed writing the "New State Director's" training program and text for NEMA which contained a comprehensive local government emergency management program design and assessment questionnaire."

"In 1996, the DRI International and the Business Continuity Institute were asked to participate in the standards-making process. As a result, the standard includes elements of the Professional Practices that both DRII and BCI developed and is consistent with DRII's Business Continuity Planning Model….

"NFPA 1600 has now been adopted as a standard by a significant part of our industry. The Federal Emergency Management Agency, DRI International, the National Emergency Managers Association (NEMA), and the International Association of Emergency Managers (IAEM) have endorsed the most recent edition of NFPA 1600. FEMA's Local Capability Assessment for Readiness (LCAR) program, which is used as a benchmark for state and local governments, is based on NFPA 1600. NEMA adopted 1600 as the basis for their Emergency Management Accreditation Program (EMAP). In addition, the American National Standards Institute (ANSI) has adopted NFPA 1600." (**Davis**, *NFPA 1600*, 2005)

NFPA 1600 Program Elements:

- 5.2. Laws and Authorities
- 5.3. Risk Assessment
- 5.4. Incident Prevention
- 5.5. Mitigation
- 5.6. Resource Management and Logistics
- 5.7. Mutual Aid/Assistance
- 5.8. Planning
- 5.9. Incident Management
- 5.10. Communications and Warning
- 5.11. Operational Procedures
- 5.12. Facilities
- 5.13. Training
- 5.14. Exercises, Evaluations, and Corrective Actions
- 5.15. Crisis Communication and Public Information
- 5.16. Finance and Administration (**NFPA**, *NFPA 1600*, 2007)

NIEM: National Information Exchange Model. (**DHS/HSEEP**, *NIEM Overview*)

NIFOG: National Interoperability Field Operations Guide. (**DHS**, *NIFOG*, 2007)

NIICL: DHS National Interagency Incident Conference Line. (**FEMA**, *Devolution of Operations Plan Template*)

NIIMS: National Interagency Incident Management System. (**NWCG**, *History of ICS*, 1994)

NIMS: National Incident Management System. (**HSGPC**, A *Nation Unprepared*, 2006,, 633)

NIMS Adoption: "The establishment of a legal authority (e.g. executive order, proclamation, resolution, legislation, or other legal mandate) that requires all departments and agencies operating within the jurisdiction to use NIMS principles and methodologies in their all-hazards incident management system." (**FEMA**, *NIMS Compliance Metrics Terms of Reference*, 2006, 7)

NIMS Baseline: "An initial assessment of NIMS compliance conducted in 2005 and/or 2006 by participating jurisdictions at State, Territorial, local, and tribal levels." (**FEMA**, *NIMS Compliance Metrics Terms of Reference*, October 2006, 7)

NIMS Compliance: "All State, territory, local and tribal jurisdictions that receive Federal preparedness assistance awards in the form of grants, cooperative agreements and direct contracts have, as a condition of receiving this funding, the requirement to be in compliance with the NIMS" (**FEMA** *National Incident Management System FY 2008 NIMS Compliance*, March 2008, slide 2; cites HSPD-5)

NIMS Compliance (FY 2007):

- DHS/FEMA required to monitor compliance of NIMS at state level.
- States no longer could self-certify NIMS compliance.
- All jurisdictions had to answer compliance metrics to assess…implementation of NIMS.
- NIMS Compliance Assistance Support Tool (NIMSCAST) made available to track and report compliance for all jurisdictions." " (**FEMA** *National Incident Management System FY 2008 NIMS Compliance*, March 2008, slide 3)

NIMS Compliance Metrics (FY 2005-2006):

- Command and Management
- Preparedness
- Resource Management
- Communication and Information Management

- Supporting Technologies. (**FEMA**, *NIMSCAST Technical Users Guide Version 1.1*. April 30, 2007, p. 26)

NIMS Compliance Metrics (FY 2007):

- State Adoption and Infrastructure
- Command and Management
- Preparedness Planning
- Preparedness Training
- Preparedness Exercises
- Resource Management
- Communication and Information. (**FEMA**, *NIMSCAST Technical Users Guide Version 1.1*. April 30, 2007, p. 26)

NIMS Compliance Metrics (New FY 2008 Metrics):

- Initiate development of a State/Territory-wide system to credential emergency management/response personnel to ensure proper authorization and access to an incident including those involving mutual aid agreements and/or assistance agreements. (**FEMA**, *FY 2008… NIMS Compliance Objectives and Metrics For States…*, Feb 2008, p. 7)

NIMS Compliance Metrics (Projected FY 2009 Metrics):

- Preparedness Planning
- Preparedness Training
- Preparedness Exercises
- Communication and Information Management
- Resource Management
- Command and Management. (**FEMA**, *FY 2008… NIMS Compliance Objectives and Metrics For States…*, Feb 2008, p. 8)

NIMS Implementation: "All activities necessary for adopting and institutionalizing NIMS. Implementation includes the formal adoption of NIMS, the use of a NIMS-compliant approach to all incident management operations, etc." (**FEMA**, *NIMS Compliance Metrics Terms of Reference*, October 2006, 7)

NIMS Integration Center: "The Office of the Director and five functional branches will provide direct oversight for the ongoing management and maintenance of the NIMS and its major components utilizing an integrated approach. The five functional branches of the NIC include the following:

· Publications Management Branch;
· Standards and Resource Branch;
· Training and Exercises Branch;
· System Evaluation and Compliance Branch; and
· Technology/R&D Branch." (**DHS**, *National Incident Management System Integration Center*, DHS Mgmt. Directive System, NIMS NIC Directive 3, MD Number 9500, March 2004)

[Note: The NIMS Integration Center, was renamed the "Incident Management Systems Integration (IMSI) Division within FEMA's Preparedness Directorate in 2007.]

NIMS National Standard Curriculum: "A curriculum designed to provide training on the NIMS. This curriculum will be built around available federal training opportunities and course offerings that support NIMS implementation. The curriculum also will serve to clarify training that is necessary for NIMS-compliance and streamline the training approval process for courses recognized by the curriculum. Initially, the curriculum will be made up of NIMS awareness training and training to support the Incident Command System (ICS). Eventually it will expand to include all NIMS training requirements including training established to meet national credentialing standards." (**FEMA**, *NIMS Compliance Metrics Terms of Reference*, October 2006, 7; See: http://www.fema.gov/pdf/emergency/nims/nsctd.pdf

NIMSCAST: National Incident Management System Compliance Assistance Support Tool. (**FEMA**, *NIMS Compliance Metrics Terms of Reference*, October 2006, p. 6)

NIMSCAST: "The NIMS Compliance Assistance Support Tool (NIMSCAST) is designed as a free, web-based self-assessment tool for State, territorial, tribal, and local governments to evaluate and report their jurisdiction's achievement of all NIMS implementation activities released since fiscal year (FY) 2005 by the National Integration Center. In addition, the NIMSCAST will provide a method for States, territories, tribal, and local jurisdictions to document their Corrective Action Plans for Tier 1 metrics which a jurisdiction is not compliant. The NIMS Capability Assessment Support Tool (NIMCAST) was released in January 2005. With the release of FY2007 NIMS Implementation Activities and Compliance Metrics, the NIMCAST name has been modified to better reflect the overall use of the tool. The NIMSCAST is designed for jurisdictions to complete a comprehensive self-assessment based on FY2007 Compliance Metrics. By using the NIMSCAST, jurisdictions will be able to assess their compliance and implementation with NIMS requirements and identify successes and shortfalls. At the end of FY2007, the Incident Management Systems Division of the National Integration Center will have the ability to assess NIMS implementation at the National, FEMA region, State, territory, tribal, and local jurisdictions. This information will allow the National Integration Center to provide information to Congress, identify best practices, and shortfalls so that appropriate technical assistance can be provided." (FEMA, *NIMSCAST Technical Users Guide Version 1.1*. April 30, 2007, p. 3)

NNE: Northern New England.

NNSA: National Nuclear Security Administration.

No Adverse Impact: Concept developed by the Association of State Floodplain Managers to promote in efforts to reduce growing flood losses. No Adverse Impact centers on "ensuring that the actions of one property owner do not adversely impact the rights and interests of other property owners, now and in the future." (**ASFPM** 2003, 45-46)

NOAA: National Oceanic and Atmospheric Administration, U.S. Department of Commerce.

NOC: National Operations Center. (**DHS,** *NIPP* 2006, p. 102)

NOC: Negotiations Operations Center (**FBI**, *USG Interag. Dom. Ter. CONPLAN*, 2001, A-1)

NOFORN: Not Releasable to Foreign Nationals. (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, 33)

Noncongregate Facilities: "Facilities that provide private or semiprivate accommodations, but are not considered temporary housing (e.g., cruise ships, tent cities, military installations, school dorm facilities, or modified nursing homes)." (**DHS**, *National Response Framework Emergency Support Function #6 – Mass Care, Emergency Assistance, Housing, and Human Services Annex* (Comment Draft), September 10, 2007, p. 7)

Non-Governmental Organization (NGO): "Non-profit making organization operating at the local, national or international levels. Distinct from a governmental organization, having no statutory ties with a national government." (**UNDHA**, *DM Glossary*, 1992, 54)

Nongovernmental Organizations: "An entity with an association that is based upon the interests of its member individuals or institutions; and, that is not created by a governmental agency, but may work cooperatively with any relevant governmental agencies. Non-governmental organizations serve a public purpose and not a private benefit. Examples of non-governmental organizations include faith based charity organizations, the Salvation Army and the American Red Cross." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, p. 38)

Nonprofit Security Grant Program (NSGP): "The Federal grant funds must be used for target-hardening activities, which can be accomplished through training or the purchase or installation of security equipment on real property owned or leased by the nonprofit organization. Allowable equipment is limited to physical security enhancements (e.g. alarm systems, bulletproof doors or windows) or inspection and screening systems (e.g. walk-through magnetometers and conveyor-belt x-ray systems used to screen personnel and packages for hazardous materials/devices). Additionally, nonprofit organization security personnel may use NSGP funds to attend security-related training courses and programs. Allowable training-related costs under NSGP are limited to attendance fees for the training, and related expenses, such as materials, supplies, and/or equipment. Allowable training topics are limited to the protection of CI/KR, including physical and cyber security, target hardening, and terrorism awareness/employee preparedness. Not all eligible nonprofit organizations and UASI communities are guaranteed to receive funding under the FY 2007 NSGP. Allocation decisions will be made based on risk and how well applicants address program requirements through their investment justifications. (**DHS**, *DHS Announces $24 Million Available to Nonprofit Organizations to Strengthen Security Through UASI Program*, April 27, 2007)

Nonprofit Security Grant Program (NSGP): Grant program for "nonprofit organizations according to criteria that include:

- Prior identified and substantiated threats or attacks by a terrorist organization, corroborated by intelligence or law enforcement reporting, toward the nonprofit or closely-related organization, either within or outside the United States;
- Symbolic value of a site as a highly recognized national or historical institution that renders it a possible terrorist target;
- Organization's role in responding to or recovering from terrorist attacks; and
- Organization's credible threat or vulnerability, as well as the potential consequences of an attack, as determined by a previously conducted risk assessment.

NSGP grants seek to integrate nonprofit preparedness activities with broader state and local preparedness efforts. The program is also designed to promote coordination and collaboration in emergency preparedness activities among public and private community representatives, state and local government agencies, and Citizen Corps Councils." (**FEMA**, *DHS Announces $24 Million in NSGP Grants*. 28 Sep 2007)

Non-specific Threat (COOP): "A threat condition implemented for a national declaration." (**FEMA**, *Department/Agency HQ Devolution of Operations Plan Template*)

Non-Stafford Federal Support to State and Local Jurisdictions: "If a community requires resources beyond those available from the State, local agencies may request certain types of Federal assistance directly from Federal departments and agencies. For example, under the Comprehensive Environmental Response, Compensation, and Liability Act, local and tribal governments can request assistance directly from the Environmental Protection Agency and/or the U.S. Coast Guard." (**DHS**, *National Response Framework -- Federal Partner Guide* (Comment Draft), September 10, 2007, p. 19)

Non-Structural Flood Mitigation: "System for reduction of the effects of floods using non-structural means, e.g. land-use planning (flood plain zoning), advance warning systems, flood insurance." (**UNDHA**, *DM Glossary*, 1992, 54)

Non-Technical Canvasses: "Involve traditional canvasses for persons and vehicles in order to identify witnesses and sources of information. Non-technical canvasses may involve residential and commercial buildings, schools, recreational sites, mass transit facilities, crime scenes and investigative scenes." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, p. 38)

NORAD: North American Defense Command. (**OCD**, *Abbreviations*, 1971, p. 3)

NORM: Normally Occurring Radioactive Material. (**DHA**, *Opening Statement*, Vayl Oxford, 3)

NORS: USNORTHCOM Operational Reporting System. (**DA**, *WMD-CST Operations*, 2007)

North Carolina Insurance Underwriting Association: "The North Carolina Insurance Underwriting Association (North Carolina Beach Plan) was created in 1969 to provide insurance coverage to people not able to buy it through the standard insurance market only on the barrier islands adjacent to the Atlantic Ocean. In 1998, the North Carolina General Assembly expanded the Beach Plan to include the state's 18 coastal counties for windstorm and hail only coverage." (**GAO**, *Natural Disasters: Public Policy Options*…, Nov 2007, p. 73)

NORTHCOM: U.S. Northern Command. See "USNORTHCOM"

Northern New England (NNE) Metropolitan Medical Response System (MMRS) Tri-State Collaborative: "The Northern New England MMRS (NNE MMRS) functions as a coordinating resource in responding to the health and medical consequences of a weapon of mass destruction attack impacting Maine, New Hampshire, or Vermont. The NNE MMRS also serves as a resource for other mass casualty events or significant outbreaks in the region, including serving

as a structure to help local communities take advantage of arriving federal assets." (**DHS**, *Expanded Regional Collaboration…FY 2004-2006*, 2006, p. 17)

NPD: National Preparedness Directorate, FEMA Headquarters.

NPD: National Preparedness Division, FEMA Regional Offices. (**FEMA**, *Regional CONOPS*, 08)

NTS: Nevada Test Site. (**FEMA**, *TEI/TO Course Catalog*, 2008, 5)

NTSB: National Transportation Safety Board.

Nuclear Accident: "Accidental release of radiation occurring in civil nuclear facilities, exceeding the internationally established safety levels." (**European Environment Agency**, *EEA*

Environmental Glossary; cites: **United Nations**, *Internationally Agreed Glossary of Basic Terms Related to Disaster Management*, 1992, p. 55)

Nuclear Assessment Program, DHS: "Depending upon the circumstances of a detector alarm, DHS' Nuclear Assessment Program assets may also be activated to conduct a credibility assessment of a radiological or nuclear threat. For example, the Nuclear Assessment Program would conduct an assessment of a detector alarm if it involved the transport of illicit nuclear material. The Nuclear Assessment Program is coordinated through the Lawrence Livermore National Laboratory and provides a national capability to assess the credibility of communicated radiological and nuclear threats. It also monitors illicit nuclear material trafficking incidents worldwide. The Nuclear Assessment Program uses nuclear specialists and behavioral analysts to determine the credibility of a particular threat. The program is accessible to any federal or state agency and can be activated independently of a nuclear detector alarm. In FY 2006, the Nuclear Assessment Program performed 120 formal assessments." (**DHS/OIG**, *DHS' DNDO Progress*…, Dec 2007, p. 24)

Nuclear Blast: "A nuclear blast is an explosion with intense light and heat, a damaging pressure wave, and widespread radioactive material that can contaminate the air, water, and ground surfaces for miles around. A nuclear device can range from a weapon carried by an intercontinental missile launched by a hostile nation or terrorist organization, to a small portable nuclear devise transported by an individual. All nuclear devices cause deadly effects when exploded, including blinding light, intense heat (thermal radiation), initial nuclear radiation, blast, fires started by the heat pulse, and secondary fires caused by the destruction." (**FEMA**, *Are You Ready? Nuclear Blast*, 2006)

Nuclear Civil Protection (NCP): "The concept of Nuclear Civil Protection (NCP) has been added to Standard Three, on emergency planning. NCP plans provide for two options: (1) Protection of the population essentially in-place, at or near their places of residence. (2) Orderly relocation of people from high-risk areas to low-risk host jurisdictions during a period of severe international crisis, should time and circumstances permit implementation of relocation plans. NCP planning for the relocation option is expected to be conducted into the 1980's, with direct Federal support and the consent and participation of States and localities." (**DCPA**, *Standards for Local Civil Preparedness*, 1978, p. 1)

Nuclear Civil Protection (NCP) Planning: "The Federal government encourages and assists localities in full-spectrum emergency planning, including a range of potential peacetime hazards…However, it is also essential (and required as a condition of eligibility for Federal assistance) that each jurisdiction's emergency plan provide for civil defense operations during periods of severe international crisis and attack.

"The term Nuclear Civil Protection (NCP) planning refers to development of plans providing the following two options: (1) Protection of the population against nuclear attack effects essentially in-place, in jurisdictions throughout the U.S., at or near their places of residence. (2) Orderly relocation of people from areas of potential high risk from the direct effects of nuclear weapons, should national authorities elect to implement relocation plans during a severe crisis, and time and

circumstances permit relocation, as well as the reception, care, and protection of relocated people in low-risk host areas.

"NCP planning for the *in-place protection option* includes development or updating of both (1) a local community shelter plan (CSP) allocation, including standby information materials for the public; and (2) emergency plans, based on the CSP allocation, covering local government operations for sheltering the population. This type of NCP planning has been underway since 1966, and many localities will need to update in-place protection plans, as new shelter surveys provide a basis for revising CSP allocations….

"NCP planning for the *relocation option* includes both local and State-level planning for relocating people from high-risk areas, during a period of severe international crisis, to low-risk jurisdictions. High-risk jurisdictions thus require plans covering operations to relocate the people during a crisis, and then to maintain security in the risk area, to keep essential industry in operation by commuting key workers, and to shelter any persons still in the risk area in best-available shelter should an attack occur. Low-risk host jurisdictions, in contrast, require plans covering reception and care of relocated population, and provision of fallout protection for use in case of attack.

"NCP planning is risk-oriented, in that plans needed by high-risk and low-risk jurisdictions will differ…Also, most low-risk jurisdictions will need plans for the contingency of hosting risk-area population in case of crisis relocation." (**DCPA**, *Standards For Local Civil Protection*, 1978, 16-17)

Nuclear Detonation Effects and Injuries: "Nuclear detonations cause three types of injuries: blast, thermal and radiation, as well as electromagnetic pulse (EMP) effects described further in a later section.

(1) *Blast injuries* are caused by the overpressure wave traveling outwards from the center of the nuclear detonation. The types of injuries are the same as occur with conventional explosives and are further described in the next section.

(2) *Thermal injuries* present as flash burns (burns from direct exposure to the thermal radiation pulse, typically ultraviolet, visible, and infrared waves) or flame burns (burns from materials set afire by the infrared energy wave igniting flammable materials).

(3) *Radiation injuries* from a nuclear blast occur from two sources: prompt and residual. Prompt radiation effects occur due to the neutrons and high-energy gamma rays emitted immediately by the weapon. Severity depends on the weapon's yield, emission spectrum, and distance to the target. Residual radiation effects are due to emissions (typically alphas, betas, and low energy gammas) from fission fragments (the heavy atom products produced during fission) and activated environmental materials (when materials absorb radiation and become radioactive themselves). Collectively, these sources are called fallout. The amount of fallout depends on the weapon's yield, type, and height of burst, while the area affected depends heavily on the wind. The hazard to personnel depends on the level of radiation present and the duration of exposure." (**JCS/DOD**, *CBRNE, Consequence Management* (JP 3-41), 2006, p. I-8)

Nuclear Emergency Search Team (NEST): "The Nuclear Emergency Support Team (NEST) is the National Nuclear Security Administration's program for preparing and equipping specialized response teams to deal with the technical aspects of nuclear or radiological terrorism. NEST capabilities include search and identification of nuclear materials, diagnostics and assessment of suspected nuclear devices, technical operations in support of render safe procedures, and packaging for transport to final disposition.

"Their mission is to provide specialized technical expertise to the Federal response in resolving nuclear or radiological terrorist incidents. This expertise is provided by well trained personnel who form specialized response teams to work in coordination with teams from other Federal agencies to resolve a nuclear terrorist crisis. NEST experts include engineers, scientists, and other technical specialists from NNSA's nuclear weapons laboratories and facilities to include Los Alamos National Laboratory, Sandia National Laboratories, Lawrence Livermore National Laboratory, the Remote Sensing Laboratory and the Pantex Plant." (**DOE**, *NEST,* Nov. 6, 2007)

Nuclear Incident: "A nuclear incident is defined as an event or a series of events, either deliberate or accidental, leading to the release, or potential release, into the environment of radioactive materials in sufficient quantity to warrant consideration of protective actions." (**EPA,** *Manual of Protective Action Guides and Protective Actions For Nuclear Incidents*, 1991, p. 1-1; **Health Physics Society**, *Guidance for Protective Actions Following a Radiological Terrorist Event*, 2004, p. 3)

Nuclear Facility Incident (Fixed): "Any occurrence at a fixed nuclear power facility (i.e., commercial power plant or other reactor facility) resulting in a potential or actual release of radioactive material in sufficient quantity to constitute a threat to the health and safety of the off-site population." (**FEMA**, *Hazard Identification*… (CPG 1-34), 1985, p. A-3)

Nuclear Incident Response Phases: "The PAG Manual [EPA 1992] establishes protective actions based on the ability to control exposure to the radioactive material and the exposure pathways that are expected to exist as a nuclear incident progresses. This approach results in classifying the response to a nuclear incident into three phases, i.e., early, intermediate, and late (recovery) phase.

- The early phase of a nuclear incident is from the beginning of the incident until the release of radioactive material is under control and is characterized by the need to make immediate decisions for protective actions.
- The intermediate phase is the period beginning after the release of radioactive material has been brought under control or has stopped and is characterized by the ability to obtain reliable radiological measurements as a basis for decision making.
- The late (recovery) phase is the period in which recovery actions are conducted to bring radiation levels to levels acceptable for the area to be returned to unrestricted use." (Health Physics Society, *Background Information on "Guidance for Protective Actions Following a Radiological Terrorist Event" Position Statement of the Health Physics Society*, 2004, p. 4)

Nuclear Incident Response Team (NIRT): "NIRT teams are specialized teams managed day-to-day by the Department of Energy (DOE) / National Nuclear Security Administration (NNSA) and the Environmental Protection Agency (EPA). They are operationally controlled by DHS/FEMA when activated to provide expert technical advice and support in disaster response operations and other needs involving nuclear weapons accidents, radiological accidents, lost or stolen radioactive material incidents, and acts of nuclear terrorism." (**DHS**, *FEMA OMA FY 09 Budget Justification*, 2008, 21)

Nuclear Incident Response Team (NIRT): "Section 506 of the Homeland Security Act of 2002 includes in its definition of the NIRT those entities of the DOE that perform nuclear or radiological emergency support functions (including accident response, search response, advisory and technical operations functions), radiation exposure functions at the medical assistance facility known as the Radiation Emergency Assistance Center/Training Site (REAC/TS), radiological assistance functions, and related functions." (**DOE**, *Departmental Radiological Emergency Response Assets*, June 27, 2007, p. 2)

Nuclear Incident Response Team (NIRT): "Created by the Homeland Security Act to provide DHS with a nuclear/radiological response capability. When activated, the NIRT consists of specialized Federal response teams drawn from DOE and/or EPA." (**USCG**, *IM Handbook*, 2006, Glossary 25-18)

Nuclear Regulatory Commission (NRC): "The NRC regulates the civilian uses of nuclear materials in the United States to protect public health and safety, the environment and the common defense and security. This mission is accomplished through: licensing of nuclear facilities and the possession, use and disposal of nuclear materials; the development and implementation of requirements governing licensed activities; and inspection and enforcement activities to assure compliance with these requirements." (**NRC**, *Enforcement Program Annual Report, Calendar Year 2007,* May 9, 2008, page vii)

Nuclear Regulatory Commission (NRC) Performance Goals:

- **Safety**: ensuring protection of public health and safety and the environment.
- **Security**: ensuring the secure use and management of radioactive materials.
- **Openness**: ensuring openness in our regulatory process.
- **Effectiveness**: ensuring that NRC actions are effective, efficient, realistic, and timely.
- **Management**: ensuring excellence in agency management to carry out the NRC's strategic objective. (NRC, *Enforcement Program Annual Report, Calendar and Fiscal Years 2005,* August 15, 2006, page ix)

Nuclear Sector Coordinating Council (NSCC): Nuclear industry group formed in 2004 "made up of industry leaders representing nuclear power plants, university research reactors, fuel fabrication facilities and manufacturers of nuclear components. The coordinating council serves as the primary liaison between the commercial nuclear sector and federal agencies on security and emergency preparedness." (**Nuclear Energy Institute**, *Nuclear Power Plant Security Backgrounder*, Sep. 1, 2006, p. 1)

Nuclear Weapon Accident: "An unexpected event involving nuclear weapons that results in any of the following:

- Accidental or unauthorized launching, firing, or use by U.S. Forces
- U.S.-supported allied forces of a nuclear-capable weapons system.
- An accidental, unauthorized, or unexplained nuclear detonation.
- Non-nuclear detonation or burning of a nuclear weapon.
- Radioactive contamination.
- Jettisoning of a nuclear weapon.
- Public hazard, actual or perceived." (**DoD**, *DoD Response to Radiological Accidents*, 1996, p. 9)

Nuclear Weapon Significant Incident: "An unexpected event involving nuclear weapons, nuclear components, or a nuclear weapon transport or launch vehicle when a nuclear weapon is mated, loaded, or on board, that does not fall into the nuclear weapon accident category but that:

- Results in evident damage to a nuclear weapon or nuclear component to the extent that major rework, complete replacement, or examination or recertification by the DoE is required.
- Requires immediate action in the interest of safety or nuclear weapons security.
- May result in adverse public reaction (national or international).
- Could lead to a nuclear weapon accident and warrants that senior national officials or agencies be informed or take action." (**DoD**, *DoD Response to Radiological Accidents*, 1996, p. 9)

Nuclear Weapons Effects: "A nuclear weapon detonation causes an intense blast, intense light and heat, and direct radiation. The blast causes a damaging wave of air pressure. Detonation at or near ground level creates a large airborne cloud of radioactive particles that can contaminate the air, water, and ground surfaces for miles around as radioactive fallout. The heavier particles fall first, nearer the site of the explosion. A very high altitude burst can create an electromagnetic pulse (EMP) that can disable electrical and electronic equipment and systems of all kinds. A nuclear device can range from a weapon carried by an intercontinental ballistic missile launched by a hostile nation, to a small portable nuclear device transported by an individual or terrorist organization. All nuclear devices cause deadly effects when exploded, including blinding light, intense heat (thermal radiation), initial nuclear radiation, blast, fires started by the heat pulse, and secondary fires caused by damage to electrical and natural gas lines, stoves and furnaces, and fallout radiation." (**FEMA**, "Fact Sheet – Nuclear Blast," April 2007, p. 1)

NUDET: Nuclear Detonation. (**OCD**, *Abbreviations and Definitions*, 1971, p. 3)

Nunn-Lugar-Domenici Domestic Preparedness Act, Defense Against Weapons of Mass Destruction Act of 1996, Public Law 104-201, Title XIV**.**

Nunn-Lugar-Domenici Domestic Preparedness Program (NLD DPP): (**FEMA**, *HSEEP Glossary*, 2008)

Nunn-Lugar-Domenici Domestic Preparedness Program (NLD DPP): "The Defense Against Weapons of Mass Destruction Act of 1996, or Nunn-Lugar-Domenici amendment to the National Defense Authorization Act for FY97, stipulated the training of first responders to deal with WMD terrorist incidents. The Nunn-Lugar-Domenici Domestic Preparedness Program began in FY97 to train first responders -- fire, police, and emergency medical technicians -- in 120 of the largest cities in the country….the 120 cities that were designated recipients of Nunn-Lugar-Domenici Domestic Preparedness Program…[were later] expanded and amended to a mixture of 157 cities and counties to replace the original 120 cities. By the end of 1998, forty cities had received training, with the remaining cities scheduled to complete training in 2001. Each city received $300,000 from the Department of Defense for personal protection, decontamination, and detection equipment….the program…[was subsequently] transferred to the Department of Justice under the Office of Justice Programs…" (James Martin Center for Nonproliferation Studies. *Nunn-Lugar-Domenici Domestic Preparedness and WMD Civil Support Teams.* October 2001)

OFCM: Office of the Federal Coordinator for Meterological Service and Supporting Research, Department of Commerce.

Office for Civilian Defense (OCD, EOP): Created on May 20, 1941 by Executive Order 8757, within the Office for Emergency Management in the Executive Office of the President. Former New York City Mayor Piorello H. LaGuardia was named Director. Upon his resignation on February 10, 1942, James M. Landis, an Assistant to the President became Director (February 11). (**Gessert**, Federal *Civil Defense Organization*, 1965, p. 60) Abolished on June 30, 1945 by Executive Order 9562 shortly after Germany surrendered during World War II. (Ibid, p. 61)

Office for Domestic Preparedness (ODP, DOJ) 1998-2007: Established in 1998 within the Department of Justice, pursuant to Public Law 105-119, and made "responsible for developing and administering a domestic preparedness program to provide financial assistance to states, U.S. territories, and local governments for domestic preparedness training and equipment." On March 1, 2003 the ODP was transferred to DHS and later renamed the Office of Grants and Training. On April 1, 2007 OGT was transferred to FEMA's National Preparedness Directorate and renamed Grant Programs Directorate. (**DHS/OIG**, *Audit*, Dec 2007, 3)

Office for Domestic Preparedness (ODP, DOJ) (2000): "I want to take this opportunity to formally welcome your agency's participation in the U. S. Department of Justice's effort to enhance the nation's emergency response communities capabilities to respond to mass casualty terrorist incidents. The staff of the Office of State and Local Domestic Preparedness Support (ODP) look forward to working with you and your staff in the implementation of this important new initiative. This Bulletin is the first in a series of informational updates our office will distribute to the designated state agencies in an effort to keep you informed of information on ODP's and other related Federal programs and our efforts to assist your office as you develop and implement your statewide strategic plans.

"Through ODP, the Office of Justice Program has established a new program office whose primary goal is building capabilities at the state and local levels through a coordinated program of equipment support; training, from the awareness level to the incident command level; exercise planning and support; and specialized technical assistance. ODP is looking to the designated state agencies to provide the critical state-based plans which will help our office more effectively allocate program funding to the jurisdictions with the greatest need. ODP is committed to working with you and your staff to coordinate the implementation of an integrated national program working in partnership with state and local agencies within your state." (**C.H. "Butch" Straub II, Director**, *ODP Information Bulletin No. 1, Subject: Office for Domestic Preparedness Support*, March 6, 2000)

Office for Domestic Preparedness (ODP, DOJ) (2000): "ODP distributes grants to 56 states and territories, as well as to firefighters, ports, transit authorities, and other homeland security stakeholders. In FY04, ODP disbursed over $4 billion in grants for emergency preparedness personnel to protect and defend our nation's security against the threat posed by terrorism. Through its streamlined grant process, ODP awards funds under the Homeland Security Grant Program (HSGP), which consolidates applications and funding for six grant programs. These are:
• *State Homeland Security Grant Program (SHSGP)…*
• *Urban Area Security Initiative (UASI)….*
• *Law Enforcement Terrorism Prevention Program (LETPP)….*
• *Citizen Corps….*
• *Emergency Management Performance Grants (EMPG…*
• *Metropolitan Medical Response System (MMRS….*
Other ODP grant programs include:
• *Assistance to Firefighters Grant Program (AFGP)….*
• *Competitive Training Grants Program (CTGP….*
• *Commercial Equipment Direct Assistance Program (CEDAP….*
• *Port Security Grant Program (PSGP)….*
• *Operation Safe Commerce (OSC)….*
• *Highway Watch® Program (HWP)….*
• *Intercity Bus Security Program….*" (**DHS**, *Office of State and Local Government Coordination and Preparedness*, 25 July 2005, pp.1-2)

Office for Emergency Management (OEM, EOP): On May 25, 1940 "The Office for Emergency Management was established upon recommendation of the revived Council of National Defense, in the Executive Office of the President." (**Gessert**, *Federal CD Organization*, 1965, p. 60)

Functions: "Assisted the President in clearing information on defense measures. Maintained liaison with national defense agencies. Coordinated the national defense program." Starting in June 13, 1942 the OEM began to be dismantled when the Division of Information was terminated by Exec Order 9182, followed by "liaison functions terminated with resignation of Liaison Officer for Emergency Management (the OEM director), November 3, 1943; and Division of Central Administrative Affairs abolished, effective November 30, 1944, by EO 9471, August 25, 1944, with the Department of the Treasury named as liquidator." (**National Archives**, *Records of the OEM, 1940-44* (Record Group 214))

Office of Civil Defense: (Department of Defense, 1961-1964; Department of the Army 1964-1972)

Office of Civil Defense Planning: Established by Presidential Directive, dated March 27, 1948 in the National Military Establishment by Secretary of Defense Forrestal. Russell J. Hopley named as Director. (**OCDP** (Hopley Report**)**, 1948, p. v; **Gessert**, *Federal Civil Defense Planning*, 1965, 63)

Office of Civilian Defense: The Office of Civilian Defense was a World War II organization. President Truman informed Congress on May 2, 1945 that the OCD would soon be terminated and its proposed budget for the next fiscal year withdrawn. Noted were developments in the European

theater of operations. (See "Statement by the President Concerning the Termination of the Office of Civilian Defense," May 2, 1945, in **Public Papers of the Presidents of the United States, Harry S. Truman,** 1945, pp. 30-31)

Office of Emergency Communications, DHS. See Department of Homeland Security, OEC.

Office of Emergency Planning (OEP) 1961-1968: "In late September 1961, Congress renamed OCDM (the Office of Civil and Defense Mobilization) again, this time as the Office of Emergency Planning (OEP) [75 Stat. 630]. Neither the duties nor the mission of the agency were changed by Congress, but the new name reflected the responsibilities of the office in the wake of the changes initiated by the President." (**CRS**, *Federal Emergency Management and Homeland Security Organization: Historical Developments and Legislative Options*. June 1, 2006)

Office of Emergency Planning (OEP): "Executive Order 10952 assigned major civil defense responsibilities to the Department of Defense. It also provided that the Director, Office of Emergency Planning, would advise and assist the President in connection with the total civil defense program and would be responsible for the continuity of government programs at the Federal, State, and local level." (**OCD,** *Annual Report 1962*, p. 13) "On September 3, 1961m effective August 1, 1961, 1,106 OCDM personnel were transferred to the Office of Civil Defense, DOD." (**OCD,** *Annual Report 1962*, p. 9)

Office of Emergency Preparedness, 1951-1973 (Including Predecessor Organizations): "Emergency preparedness planning functions initially vested in National Security Resources Board (NSRB), established by the National Security Act of 1947 (61 Stat. 499), July 26, 1947, as an independent agency to advise the President on mobilization coordination. NSRB transferred to the Executive Office of the President by Reorganization Plan No. 4 of 1949, effective August 20, 1949, and abolished by Reorganization Plan No. 3 of 1953, effective June 12, 1953, with its functions transferred to the Office of Defense Mobilization (ODM). ODM had been established by EO 10193, December 16, 1950, to direct federal mobilization activities. ODM absorbed functions of the Defense Production Administration, established by EO 10200, January 3, 1951, to exercise general control of the defense production program, and abolished by EO 10433, February 4, 1953.

ODM consolidated with the Federal Civil Defense Administration (see RG 397) to form Office of Defense and Civilian Mobilization (ODCM), with responsibility for civil defense and emergency mobilization coordination, by Reorganization Plan No. 1 of 1958, effective July 1, 1958. ODCM renamed Office of Civil and Defense Mobilization (OCDM) by an act of August 26, 1958 (72 Stat. 861). Civil defense functions of OCDM transferred to the Office of the Secretary of Defense by EO 10952, July 20, 1961. OCDM redesignated Office of Emergency Planning (OEP) by an act of September 22, 1961 (75 Stat. 630). OEP coordinated emergency preparedness activities, principally in areas of resource utilization, civil defense, economic stabilization, postattack rehabilitation, and government organization and continuity. Redesignated Office of Emergency Preparedness, 1968." (**National Archives**, *Guide to Federal Records, Records of the Office of Emergency Preparedness*, 1995)

Office of Grants and Training (OGT): "In the 1998 Appropriations Act (Public Law 105-119) and accompanying report, the Congress expressed its concern regarding the real and potentially catastrophic effects of a chemical or biological act of terrorism. Congress stated that, while the Federal Government plays an important role in preventing and responding to these types of threats, state and local public safety personnel are typically first to respond to the scene when such incidents occur. As a result, Congress authorized the Attorney General to assist state and local public safety personnel in acquiring the specialized training and equipment necessary to safely respond to and manage terrorist incidents involving weapons of mass destruction (WMD).

"On April 30, 1998, the Attorney General delegated authority to the Justice Department's Office of Justice Programs (OJP) to develop and administer training and equipment assistance programs for state and local emergency response agencies to better prepare them against this threat. To execute this mission, the Office of Justice Programs established the Office for Domestic Preparedness (ODP) to develop and administer a national Domestic Preparedness Program.

"Upon passage of the Homeland Security Act of 2002 (Pub. L. 107-296), the Office for Domestic Preparedness was transferred to the Department of Homeland Security from OJP. In 2003, a number of grant programs and functions from other DHS components were consolidated with ODP under a new DHS agency, the Office of State and Local Government Coordination and Preparedness (SLGCP).

"In 2005, SLGCP was incorporated under the Preparedness Directorate as the Office of Grants and Training (G&T)." (**FEMA**, *About Grants & Training*, April 3, 2007)

Transferred to FEMA on April 1, 2007 and renamed the Grants Programs Directorate.

Office of Health Affairs (OHS/DHS). See Department of Homeland Security, OHS.

Office of Homeland Security: Established by Executive Order on March 8, 2001. "The mission of the Office shall be to develop and coordinate the implementation of a comprehensive national strategy to secure the United States from terrorist threats or attacks." (**White House**, EO 13228, October 8, 2001).

Office of Homeland Security: "The September 11 attacks shattered confidence in the Federal government's capability to prevent terrorism attacks on the homeland. There was widespread concern about the seeming ease with which the terrorists involved in the attacks entered and remained in the United States as well as the inability of Federal agencies to 'connect the dots' concerning the evidence of the upcoming attacks. In response, in October 2001, President Bush issued an Executive Order to establish the Office of Homeland Security within the White House to coordinate counterterrorism efforts…. The President selected Pennsylvania Governor Tom Ridge, who resigned his position as Governor to head the Office and lead the coordination efforts.

"The public response to Governor Ridge's appointment was generally favorable but there were concerns that this new position did not have the authority or resources needed to centralize the homeland security function, and that Ridge's advisory position gave him no control over many

agencies involved. The appointment also troubled some members of Congress because Congress' oversight role was minimized under this structure. Legislation based on the recommendations of the Commission on National Security/21st Century [Hart-Rudman] was soon introduced to establish a Cabinet-level Department of Homeland Security. The Bush Administration initially opposed such a step, but as support for a new cabinet Department grew, the White House began its own design work.

A small group of aides, meeting at the White House, devised a plan which was reviewed only by senior White House officials before being approved by President Bush. This plan, which came as a surprise to the Cabinet officials most affected by it was unveiled in June 2003 after six weeks of meetings. The lack of open debate by key players, which was designed to speed the process by limiting review, is seen by many as having set in motion some of the organizational problems which plague DHS to this day.

After several months of debate focusing primarily on a new personnel system proposed by the White House, Congress passed legislation establishing the new Department along the lines proposed by the White House and the earlier Congressional legislation. On November 25, 2002, the President signed into law the Homeland Security Act, setting in motion the largest Federal reorganization since the creation of the Department of Defense in 1947. Governor Ridge was named DHS's first Secretary." (NAPA, *Addressing the 2009 Presidential Transition at…DHS*, May 2008 Agency Review Draft, pp. 8-9)

Office of National Security Coordination (ONSC), FEMA: "The Office of National Security Coordination (ONSC) represents the Federal Emergency Management Agency (FEMA), Department of Homeland Security (DHS), as the Federal Executive Branch Lead Agent, to coordinate and ensure continuity of national essential functions, and minimize the disruption of essential operations to guarantee the survival of an Enduring Constitutional Government. ONSC is responsible for policy, test, training and exercise of Executive Branch activities involving Continuity of Operations, Continuity of Government, and Contingency Programs to ensure appropriate preparation and execution of operations, in response to a full threat spectrum of emergencies. ONSC is also responsible for management of the Mount Weather Emergency Operations Center in support of a wide variety of FEMA and DHS functions, as well as other federal departments and activities." (**FEMA**, *ONSC*, September 15, 2006)

Office of Nuclear Security and Incident Response (NSIR), US NRC: Created by NRC on April 11, 2002 "to improve NRC effectiveness in assuring protection of the public health and safety from security threats at licensed facilities. (**NRC**, *Emergency Preparedness in Response to Terrorism,* October 31, 2007 update)

Office of Nuclear Security and Incident Response (NSIR) US NRC, Mission: Develops overall agency policy and provides management direction for evaluation and assessment of technical issues involving security at nuclear facilities, and is the agency safeguards and security interface with the Department of Homeland Security (DHS), the Intelligence and Law Enforcement Communities, Department of Energy (DOE), and other agencies. Develops emergency preparedness policies, regulations, programs, and guidelines for both currently licensed nuclear reactors and potential new nuclear reactors. Provides technical expertise

regarding emergency preparedness issues and interpretations, conducts and directs the NRC program for response to incidents, and is the agency emergency preparedness and incident response interface with the DHS, Federal Emergency Management Agency (FEMA) and other Federal agencies." (**NRC**, *Office of Nuclear Security and Incident Response* (Web Site), 2008)

Office of Operations Coordination (OPS), DHS. See Department of Homeland Security, OPS.

Office of Preparedness and Emergency Operations (OPEO), ASPR, HHS: "OPEO is headed by a Director who is a Deputy Assistant Secretary (DAS), and is responsible for ensuring that ASPR has the systems and processes necessary to coordinate the Department's response to bioterrorism and other public health and medical threats and emergencies. OPEO leads the response activities required to fulfill HHS's responsibilities under Emergency Support Function (ESF) 8 of the National Response Plan (NRP). OPEO develops and directs the Secretary's Operations Center (SOC); trains and manages the Incident Response Coordination Team (IRCT); coordinates and executes the HHS Continuity of Operations (COOP) and Continuity of Government (COG) programs; plans, implements and evaluates Departmental and interagency response exercises; and develops security related policies establishing procedures to manage the Department's risks, threats and vulnerabilities. OPEO also is the primary operational liaison to emergency response entities within HHS (e.g., SAMHSA, CDC, FDA, and HRSA) and within the interagency community (e.g.; DHS, DOD, and Department of Veterans Affairs)." (**HHS**, Job Announcement HHS-OS-2008-0169, Program Specialist (Watch Officer), Dec 2007)

Office of Public Health Emergency Medical Countermeasures (OPHEMC), HHS.

Office of Public Health Emergency Preparedness (OPHEP), HHS. Now the Office of the Assistant Secretary for Preparedness and Response (ASPR).

Office of State and Local Government Coordination and Preparedness (SLGCP):
"The Department of Homeland Security's (DHS) Office of State and Local Government Coordination and Preparedness (SLGCP) is the federal government's lead agency responsible for preparing the nation against terrorism by assisting states, local and tribal jurisdictions, and regional authorities as they prevent, deter, and respond to terrorist acts. SLGCP provides a broad array of assistance to America's first responders through funding, coordinated training, exercises, equipment acquisition, and technical assistance.

One of SLGCP's major responsibilities is implementing Homeland Security Presidential Directive-8 (HSPD-8). Under HSPD-8, President George W. Bush directed DHS to establish a National Preparedness Goal. Spearheaded by SLGCP, this effort brings together experts from federal, state, and local government, as well as the private and non-profit sectors, to set National Preparedness Priorities and to integrate federal preparedness programs into a more coordinated system to achieve the goal of a better prepared America. The National Preparedness Goal will enable members of the homeland security community to compare current capabilities to national targets, identify needs, establish priorities and, ultimately, focus our collective efforts to ensure that our homeland is secure." (**DHS**. *Office of State and Local Government Coordination and Preparedness*, 25 July 2005, p. 1)

Office of the Assistant Secretary for Preparedness and Response (ASPR, HHS): "The Office of the Assistant Secretary for Preparedness and Response (formerly the Office of Public Health Emergency Preparedness) serves as the Secretary's principal advisory staff on matters related to bioterrorism and other public health emergencies. ASPR also coordinates interagency activities between HHS, other Federal departments, agencies, and offices, and State and local officials responsible for emergency preparedness and the protection of the civilian population from acts of bioterrorism and other public health emergencies." (**HHS**, *ASPR*)

Officer: "The ICS designation for the personnel responsible for the Command Staff positions of Liaison, Public Information and Safety." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 56)

OFRD: Office of Force Readiness and Deployment, US HHS.

OGT: Office of Grants and Training, DHS. Transferred to FEMA's Preparedness Directorate April 1, 2007 and renamed Grant Programs Directorate.

OHMS: Office of Hazardous Materials Safety, PHMSA, DOT.

OI&A: Office of Intelligence and Analysis (Division of DHS Preparedness Directorate). (**DHS,** *NIPP* 2006, p. 102)

OIG: Office of Inspector General.

OIP: Office of Infrastructure Protection (Division of DHS Preparedness Directorate). (**DHS,** *NIPP*, 2006, p. 102)

OM: Office of Management, FEMA.

OMA: Operations, Management, and Administration (**DHS**, *FEMA OMA FY 09…*, 2008, p. 3)

OMB: Office of Management and Budget, Executive Office of the White House.

On Scene Commander: "1. An individual in the immediate vicinity of an isolating event who temporarily assumes command of the incident. 2. The federal officer designated to direct federal crisis and consequence management efforts at the scene of a terrorist or weapons of mass destruction incident." (**DA**, *WMD-CST Operations*, December 2007, Glossary-14)

On Scene Coordinator: "The On-Scene Coordinator (OSC) is the federal official responsible for monitoring or directing responses to all oil spills and hazardous substance releases reported to the federal government. The OSC coordinates all federal efforts with, and provides support and information to, local, state and regional response communities. The OSC is an agent of either EPA or the U.S. Coast Guard, depending on where the incident occurs. EPA OSCs have primary responsibility for spills and releases to inland areas and waters, while U.S. Coast Guard OSCs have responsibility for coastal waters and the Great Lakes. In general, the OSC has the following key responsibilities during and after a response to a hazardous substance release or an oil spill:

(1) assessment; (2) monitoring; (3) response assistance; and (4) evaluation." (**EPA**, *On Scene Coordinators*, September 17, 2007)

On-Site Assistance (OSA): "On-Site Assistance develops a program to attain required emergency preparedness objectives identified. The goal of OSA is to help local communities develop and maintain maximum capabilities in order to actually conduct coordinated life-saving operations in extraordinary emergencies." (**DCPA**, *On-Site Assistance* (MP-63), 1974, p. 1)

"While the goal of OSA can be expressed in a single sentence, helping a community achieve emergency operational readiness can be a complex process involving considerable effort and requiring that many determinations be made along the way. The following questions must be answered for each community if operational readiness assistance is to be applied in the most effective manner.

1. What is the status of civil preparedness in the local community?
2. What is the existing level of emergency operational readiness in the local community?
3. How can the level of emergency operational readiness be increased?
4. What realistically can be done to make civil preparedness a vital entity within the community and to increase the community's ability to respond to an emergency?
5. What course of action and program of assistance will be most effective within the community?" (Ibid, p. 2)

On-Site Assistance Action (Implementation) Plan: "The Action Plan represents a feasible program to eliminate deficiencies [noted during "The Survey"] and should identify and schedule specific work needed, and assign the responsibility (Regional, State, or local, or combination thereof). It should be approved and signed by representatives of each level, and represent a commitment on the part of each to do the work indicated." (**DCPA**, *On-Site Assistance* (MP-63), 1974, p. 11)

On-Site Assistance Definition: "A major effort to assist local government in improving their emergency operational capability to cope with natural disasters and other peacetime emergencies, in addition to the effects of nuclear attack. It involves direct on-site (at locality) Federal, State, and local effort; and consists of a number of specific steps, such as assessing existing capabilities, surveying local needs, and developing a program to meet requirements identified. The objective is to give concrete and, where, possible, timely assistance, in addition to comprehensive long-range help, taking maximum advantage of existing Federal, State, and local resources." (**DCPA**, *On-Site Assistance* (MP-63), 1974, p. 4)

On-Site Assistance (Local Government): "Building on studies of the status of local operational planning and readiness conducted in prior years, a technique and program were developed for providing on-site assistance in local communities during fiscal year 1972. On-Site Assistance is the top priority program of the Defense Civil Preparedness Agency. The program is designed to help local governments (counties, cities, towns) access their existing level or readiness to conduct coordinated operations in both peacetime and attack-caused emergencies, and then to take specific steps to improve their emergency readiness. The program involves

direct on-site effort by teams of State and DCPA Regional professionals working with local officials. The On-Site Assistance Program requires that civil preparedness be viewed as a total preparedness effort….on-site assistance is basically a people-oriented program, emphasizing planning, organizing, training, and exercising; and requiring some shift in approach and attitude from the more hardware-oriented programs of the 1960's." (**DCPA**, *Civil Preparedness – A New Dual* Mission, 1972, p. 7)

On Site Assistance (State Government): "During fiscal year 1973, a project was launched to ascertain the need for On-Site Assistance at the State level. Work was completed on a prototype basis in South Carolina, and in the Commonwealth of Pennsylvania, following Hurricane Agnes. The prototype work resulted in a detailed plan for joint State and Federal efforts to improve operational readiness in South Carolina. As a result, the South Carolina Legislature revised and updated the State Civil Defense Law." (**DCPA**, *Foresight, DCPA Annual Report FY 73*, p. 10)

On Site Incident Management: "Onsite Incident Management is the capability to effectively direct and control incident activities by using the Incident Command System (ICS) consistent with the National Incident Management System (NIMS)." (**DHS**, *TCL*, 2007, p. 197)

ONA: Other Needs Assistance. (**GAO**, *Natural Disasters: Public Policy Options*, Nov 2007, ii)

One-Hundred Year (100-Year) Flood: "A 100-year flood is that flood that has a 1% chance of occurrence in any given year; a 500-year flood has a 0.2% chance of occurrence in any given year. However, the occurrence of a 100-year flood in a given year does not mean that a similar or larger flood can not occur in the following year, or even later that same year. As a result of this yearly independence, there is a 26% chance that a 100-year flood will occur or be exceeded within a 30-year period (the life of a typical mortgage)."[92] (**Galloway**, *CA Challenge*, 2007, 15)

"One hundred year protection is not an acceptable level of protection for urban areas." (Ibid, 33)

One-Hundred Year (100-Year) Floodplain: The land area adjoining a river, stream, lake, or ocean which is inundated by the 100-year flood, also referred to as a flood having a 1 percent chance of occurring in any given year. The 100-year flood is the regulatory (base) flood under the NFIP. (**FEMA**, *Definitions of Terms*, 1990)

One-Percent Annual Chance Flood: A flood of the magnitude that has a one-percent chance of being equaled or exceeded in any given year. Often referred to as the "100-year" flood or base flood, the one-percent annual chance flood is the standard most commonly used for floodplain management and regulatory purposes in the United States.

---

[92] Referenced: "A 2004 Report by the Association of State Floodplain Managers Foundation, *Reducing Flood Losses: Is the 1% Chance Flood Standard Sufficient?* concluded that "The prescriptive 1% chance standard oversimplifies complicated concepts. Much happens within the floodplain that cannot be captured in a simple "in or out" determination. Although such simplicity has its appeal, a broader, more flexible approach would allow for the reflection of more detail and more accuracy." Because of the standard, development has tended to cluster just outside of the 1% floodplain boundary, an area not free from flood risk and possibly subject to considerable risk where watersheds have been urbanized and runoff thereby increased."

ONS: Operation Neptune Shield. (**GAO**, *Maritime Security*, December 2007, p. iv)

ONSC: Office of National Security Coordination, FEMA.

OP: Office of Preparedness, General Services Administration, 1973-1975.

OPA: Otherwise Protected Area. (**FEMA**, *Call for Issues Status Report*, 2000, xxiii)

OPA 90: Oil Pollution Act of 1990. (**GAO**, *Maritime Security*, December 2007, p. 4)

OPCEN: Operations Center. (**Dept. Army**, *WMD-CST Operations*, December 2007, p. 1-3)

Open Source (OSINT): "Publicly available information and unclassified information that has limited public distribution or access." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, p. 38)

OPEO: Office of Preparedness and Emergency Operations, Office of the Assistant Secretary for Preparedness and Response, Office of the Secretary of Health and Human Services, HHS.

Operable Communications: "Agencies must be "operable," meaning they must have sufficient public safety and service agency communications capabilities to meet their everyday internal requirements before they place value on being "interoperable," meaning being able to work with other disciplines and agencies. They need to improve those systems first but this improvement planning needs to include a vision for improved interoperability with other disciplines and agencies. At a time when more attention is being paid to interoperability among different disciplines and jurisdictions within the community, there still exists fundamental communication deficiencies within disciplines and jurisdictions as practitioners strive to perform the most routine and basic elements of their job functions." (**DHS**, *TCL*, 2007, p. 39)

Operation Alert, 1954: "The first national and international civil defense test exercise on the inter-American continent was held June 14 and 15, 1954. The 48 States, the District of Columbia, Alaska, Hawaii, Puerto Rico, and the Virgin Islands participated as did the Canadian Government and its provinces. Operation Alert 1954 gave valuable training to hundreds of thousands of civil defense workers and tested certain civil defense operational capabilities." (**FCDA**, *1954 Annual Report*, p. 1; see, also, p. 34-45, 73-74, 90-91)

"In addition to educating the public and training civil defensee organizations, the test pointed up the overall civil defense problem, the extent of national readiness, the Federal Government's responsibilities in a national emergency, and the need for improved organiztion and procdeures for emergency operations. As a result of the exercise, changes were made in the emergency communications system, requirement for operational data from the field, requirements for action by national headquarters, training of FCDA personnel, aande the method of holdidng civil defense exercises. Most far-reaching of the changes was that involving the communications system." (**FCDA**, *1954 Annual Report*, p. 74)

Operation Alert 1959: "In Operation Alert 1959, all commercial broadcasting and telecasting in the United States ceased for the first time in daylight hous to permit a 30-minute test of the Control of Electromagnetic Radiation (CONELRAD) system." (**OCDM**, *Annual Report 1959*, p. 12)

Operation Alert 1960: "Operation Alert 1960 was a 3-day nationwide exercise held from May 3 through May 5. Confined to the testing of immediate and short-term response of the people and their governments to a simulated nuclear Attack, the exercise was more realistic than any of its six predecessors. It especially emphasized action on the following fronts: (1) Warning action, including shelter-evacuation-dispersion of key resources and relocation of governments; (2) collection, evaluation, analysis, and presentation of attack data and weapons effects; (3) operational control and use of communications; (4) early post-attack decisions and staff-supported decisions; and (5) use of monitors at all levels to assure correct play of the exercise and to evaluate participation.

The President, the Secretary of Defense, and the Director of OCDM aderessed the public as part of a 30-minute test of the CONELRAD (Control of Electromagnetic Radiations) system at the beginning of the exercise…..

Forty-eight of the fifty State governments took part in the exercise, and local government activities were considerable even in two States not participating. In some States, the National Guard played a substantial role in the exercise…." (**OCDM**, *Annual Report 1960,* p. 60)

Operation Alert 1961: "OCDM's major test and exercise during the year was Operation Alert 1961, held nationwide over a 5-day period from April 26 through April 30 in two parts: (1) Increased readiness phase, April 26-28; and (2) attack phase, April 28-30…. The initial phase was the first nationwide testing of new plans and procedures for degrees of readiness. The experience was invaluable for future guidance in developing techniques for the purpose." (**OCDM**, *Annual Report 1961*, p. 87)

Operation Cue: "Early in the morning of May 5, 1955, millions of Americans viewed the awe-inspiring spectacle of a nuclear blast, Operation Cue, the join test pooject of FCDA, AEC, and private industry at the Atomic Energy Commission's Nevada Test Site.

"The purpose of Operation Cue was dual: to give the American public some conceptin of the tremendous destructive energy of an atomic explosion and to test materials and techniques necessary to divil defense preparedness….

In additon to the FCDA and AEC test staff, more than 200 civil defense personnel from State and local organizations participated. State and local observers helf field exercises in the exposed area when it was safe to enter, carrying out rescue, medical, warden, police, mass feeding, and other civil defense functions. As part of the exercise a selected group of civil defensee personnel experienced the blast in a trench 2 miles from ground zero.

Test homes and commercial buildings showing representative types of construction, communications and utilities installations, and shelters were built at different ranges from ground zero. Experts were able to observe the technical effects of an atomic detonation on the test items, and the public was given a general idea of the destructive power of the weapon. Vehicles, food, clothing materials, and other items exposed in the test represented hundreds of thousands of dollars in time and materials donated by private industry." (**FCDA**, *1955 Annual Report*, 44)

Operation Doorstep: Public test of an atomic device on March 17, 1953. "The dramatic story of typical American homes and cars subjected to an atomic blast was relayed to millions of Americans by newspapers, television, radio, newsreels, and magazines. 'Operation Doorstep' demonstrated that proper preparation could save lives at home." (**FCDA**, *1953 Annual Report*, 1)

Operation Intercept: A September 2006 "multi- jurisdictional RN prevention functional exercise [in NJ] that included CBRNE response assets, law enforcement, fire/hazmat, and intelligence analysts at the federal, state, and local levels." (**DHS**, *DNDO Exercises*, 2007)

Operation Ivy: "…the official film of a thermonuclear explosion at Eniwetok in 1952…. This film was publicly shown first in April 1954." (**FCDA**, *1954 Annual Report*, p. 1)

Operation LIBERTY SHIELD: "Operation LIBERTY SHIELD is a comprehensive national plan designed to increase protections for America's citizens and infrastructure while maintaining the free flow of goods and people across our border with minimal disruption to our economy and way of life. Operation LIBERTY SHIELD is a multi-department, multi-agency, national team effort. It includes:

- Increased security at borders
- Stronger transportation protections
- Ongoing measures to disrupt threats against our nation
- Greater protections for critical infrastructure and key assets
- Increased public health preparedness
- Federal response resources positioned and ready." (**White House**, *Operation Liberty Shield*, March 17, 2003, p. 1)

Operation Neptune Shield (ONS): "…a Coast Guard operations order…First issued in 2003 and revised periodically since, it contains a classified set of requirements establishing the Coast Guard's homeland security activity levels. As such, the order sets scalable performance minimums that escalate as the MARSEC level increases." (**GAO**, *Maritime Sec*., Dec 2007, 44)

Operation Sentinel: March 1957 Federal Civil Defense Administration ground postt exercise "involving officials from all levels of government was held at FCDA Headquarters… The exercise…tested staff procedures and considered major operational problems which could result from a nuclear war against this country." (**FCDA**, *1957 Annual Report*, 1)

Operation Stonegarden Grants (OPSG): "OPSG is an element of the FY 2008 State Homeland Security Grant Program. OPSG funds land border jurisdictions' efforts to improve border security, encourage local operational objectives and capabilities to enhance federal and state Homeland Security strategies, and improve capabilities required for border security and protection." (**DHS**, *Fact Sheet: Fiscal Year 2008 Preparedness Grants*, 1Feb2008)

Operational Continuity (OC): "…operational continuity is the more general term for business continuity and is used to emphasize relevance to all types of organizations in the public and private sectors." (**ISO 22399**, *Societal Security*, 2007, p. vi)

"Strategic and tactical capability, pre-approved by management, of an organization to plan for and respond to conditions, situations and events in order to continue operations at an acceptable predefined level." (**ISO 22399**, *Societal Security*…, 2007, 4)

Operational Continuity Management (OCM): "Holistic management process that identifies potential impacts that threaten an organization and provides a framework for building resilience with the capability for an effective response that safeguards the interests of its key stakeholders, reputation, brand and value-creating activities. Note: Operational continuity management also involves the management of recovery or continuity in the event of an incident, as well as management of the overall program through training, rehearsals, and reviews, to ensure the operational continuity plan stays current and up-to-date." (**ISO 22399**, *Societal Security*, 2007, 4)

Operational Continuity Management Program: "Ongoing management and governance process supported by top management and resourced to ensure that the necessary steps are taken to identify the impact of potential losses, maintain viable recovery strategies and plans, and ensure continuity of functions/products/services through exercising, rehearsal, testing, training, maintenance and assurance." (**ISO 22399**, *Societal Security*…, 2007, 4)

Operational Continuity Management Team: "Group of individuals functionally responsible for directing the development and execution of the operational continuity pal, declaring an emergency/crisis situation and providing direction during the recovery process both pre-and post-disruptive incident. Note: The operational continuity management team may include individuals from the organizations as well as immediate and first responders, stakeholders, and other interested parties." (**ISO 22399**, *Societal Security*…, 2007, 4)

Operational Continuity Plan (OCP): "Documented collection of procedures and information that is developed, compiled and maintained in readiness for use in an incident." (**ISO 22399**, *Societal Security*…, 2007, 4)

Operational Continuity Strategy: "Approach by an organization that will ensure its recovery and continuity in the face of a disruptive event, crisis or other major outage." (**ISO 22399**, *Societal Security*…, 2007, 4)

Operational Continuity Team: "Group of individuals responsible for developing, executing, rehearsing, and maintaining the operational continuity plan, including the processes and procedures." (**ISO 22399**, *Societal Security*…, 2007, 4)

Operational Exposure Guidance: "A flexible system of radiation exposure control that allows the commander to calculate the maximum amount of nuclear radiation that he considers a unit may be permitted to receive while performing a particular mission or missions in order to reduce casualties in radioactive fallout areas, yet still be able to accomplish the mission." (**DA**, *WMD-CST Operations*, December 2007, Glossary-15)

Operational Period: "The time scheduled for executing a given set of operation actions, as specified in the Incident Action Plan. Operational periods can be of various lengths, although usually they last 12–24 hours." (**FEMA**, *NIMS* (FEMA 501/Draft), August 2007, p. 155)

Operational Period: "The period of time scheduled for execution of a given set of operation actions as specified in the IAP. Operational Periods can be various lengths, usually not over 24 hours. The Operational Period coincides with the completion of one planning "P" cycle (see Chapter 3 planning cycle)." (**USCG**, *IM Handbook*, 2006, Glossary 25-18)

Operational Phase System, DHS: "Notifications are a critical NOC function and as part of an ongoing review of its processes and procedures, OPS implemented the DHS Operational Phase System on March 1, 2007. The four operational phases under which the NOC now operates are: Steady-State; Phase 1 – Awareness; Phase 2 – Concern; and Phase 3 – Urgent. The new system enables recipients to quickly understand the conditions of the situation for which they receive a notification message, understand the corresponding severity of the event/threat, and provide key information in standardized formats." (**DHS**, *Statement of Frank DiFalco, Director of the National Operations Center, Office of Operations Coordination*, June 20, 2007, p. 8)

Operational Plans: "Operational plans identify and direct the agencies/organizations and resources required to execute the tasks and objectives necessary based on the strategic planning. Operational plans often include (but are not limited to) contingency and tactical plans." (**FEMA**, *NIMS* (FEMA 501/Draft), August 2007, p. 17)

Operational Planning: "There are two branches of operational planning under the IPS: [Integrated Planning System] (i) Federal prevention/protection operational planning; and (ii) Federal response/recovery operational planning." (**DHS**, *IPS Draft Description*, Jan 3, 2008)

[Note: In the draft NPS predecessor document, the National Planning and Execution System, these two types of plans were referred to in their original military language as Contingency Planning and Crisis Action Planning.]

Operational Planning: "Interagency Definition – The process by which specific resource, personnel, and asset applications are made to execute the objectives of the strategic plan. An operational plan contains a full description of the concept of operations with supporting annexes, as appropriate." (**DHS**, *Interagency Planning Workshop*, November 29, 2007, slide 22) [See "Strategic Planning: Interagency Definition," and "Tactical Planning: Interagency Definition".]

Operational Resilience: "Mitigating the vulnerability of government and private sector operations to man-made or natural disasters depends not only on the structural resilience of our assets, systems, and networks but also on operational resilience. First, we will continue to maintain comprehensive and effective continuity programs, including those that integrate continuity of operations and continuity of government programs, to ensure the preservation of our government under the Constitution and the continuing performance of national essential functions – those government roles that are necessary to lead and sustain the Nation during and following a catastrophic emergency. A national approach to continuity also requires that State, local, and Tribal governments work to ensure that they are able to maintain or rapidly resume effective functioning during and after catastrophic incidents and are able to interact effectively

with each other and the Federal Government. Likewise, we strongly encourage the private sector to conduct business continuity planning that recognizes interdependencies and complements governmental efforts – doing so not only helps secure the United States, but also makes good long-term business sense for individual companies. Such integrated and comprehensive planning is essential to protecting and preserving lives and livelihoods and maintaining our robust economy during crises." (**White House**, *National Strategy for Homeland Security*, October 2007, p. 29)

Operational Risk: "The risk of loss resulting from inadequate or failed procedures and controls. This includes loss from events related to technology and infrastructure, failure, business interruptions, staff related problems, and from external events such as regulatory changes." (**DigitalCare**, *State of Oregon Business Continuity Workshop*, 2006, 60)

Operations-Based Exercise: "Operations-based exercises are a category of exercises characterized by actual response, mobilization of apparatus and resources, and commitment of personnel, usually held over an extended period of time. Operations-based exercises can be used to validate plans, policies, agreements, and procedures. They include *drills*, *FEs*, and *FSEs*. They can clarify roles and responsibilities, identify gaps in resources needed to implement plans and procedures, and improve individual and team performance. (Note: These exercises often follow after, and validate, the lessons learned from discussion-based exercises.)" (**FEMA**, *HSEEP Glossary*, 2008)

Operational Security: "The implementation of procedures and activities to protect sensitive or classified operations involving sources and methods of intelligence collection, investigative techniques, tactical actions, counter surveillance measures, counter intelligence methods, undercover officers, cooperating witnesses and informants." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, p. 38)

Operations-based Exercises: "Operations-based Exercises validate plans, policies, agreements and procedures, clarify roles and responsibilities, and identify resource gaps in an operational environment. Types of Operations-based Exercises include:

- *Drill.* A drill is a coordinated, supervised activity usually employed to test a single, specific operation or function within a single entity (e.g., a fire department conducts a decontamination drill).

- *Functional Exercise (FE).* A functional exercise examines and/or validates the coordination, command, and control between various multi-agency coordination centers (e.g., emergency operation center, joint field office, etc.). A functional exercise does not involve any "boots on the ground" (i.e., first responders or emergency officials responding to an incident in real time).

- *Full-Scale Exercises (FSE).* A full-scale exercise is a multi-agency, multi-jurisdictional, multi-discipline exercise involving functional (e.g., joint field office, emergency operation centers, etc.) and "boots on the ground" response (e.g., firefighters decontaminating mock victims)." (**FEMA**, *About HSEEP*, 2008)

Operations Coordination Center (OCC): "The primary facility of the Multi-Agency Coordination System. It houses staff and equipment necessary to perform MAC functions." (**USCG**, *IM Handbook* 2006, Glossary 25-19)

Operations Coordination Group (OCG), DHS: "Another OPS [Office of Operations Coordination] led effort to enhance DHS and federal operations is DHS's Operations Coordination Group (OCG). This forum provides inter and intra departmental information sharing at the "strategic operations officer" level and includes representatives from DOD's Joint Director of Military Support, NORTHCOM Joint Staff J-3, National Guard Bureau J-3, FEMA, ICE, CBP, USCG, TSA, USSS, and CIS (additional members can be added at the discretion of the Group). This homeland security body enhances information flow and ensures that issues regarding planning, training, exercises, and incident management are properly coordinated in a timely manner. This semi-formal process with established agency and department representation helps foster needed interactions and feedback from peers on operational matters." (**DHS**, *Statement of Frank DiFalco, NOC Director, Office of Operations Coordination*, 20June07, 7-8)

Operations Order (OPORD): "A directive issued by a commander to subordinate commanders to effect the coordinated execution of an operation." (Army Trans School, *Crisis Action Planning*, slide 5)

Operations Plan: "The term 'operations plan' on "OPLAN" refers to a plan that identifies detailed resource, personnel and asset allocations in order to execute the objectives of the strategic plan and turn strategic priorities into operations, to include specific roles and responsibilities, tasks, integration, and actions required, with supporting support function annexes as appropriate." (**White House**, *Annex I "National Planning" to HSPD-8*, 2007, p. 2)

Operations Section (ICS): "The Section responsible for determining and implementing tactical objectives, conducting tactical operations and directing all resources. (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 56)

Operations Security (OPSEC): "A process to identify, control and protect information that is generally available to the public regarding sensitive or classified information and activities that could be used by a potential adversary to the disadvantage of a governmental agency, non-governmental organization or private entity/individual. Application of the OPSEC process promotes operational effectiveness by helping prevent the inadvertent compromise of sensitive or classified information regarding the activities, capabilities, or intentions of a governmental agency, non-governmental organization or private entity/individual. The operations security process involves five steps.

1. Identify critical information: what must be protected?

2. Analyze the threat: who is the potential adversary?

3. Analyze direct and indirect vulnerabilities: how might the adversary collect the information that must be protected?

4. Assess the risk: balance the cost of correcting the vulnerabilities as compared to the cost of losing the information that must be protected.

5. Implement appropriate countermeasures: eliminate or reduce vulnerabilities, and/or disrupt the adversary's collection capabilities and efforts and/or prevent the accurate interpretation of the information that must be protected." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, pp. 38-39)

Operations Section: "The Section responsible for all tactical incident operations and implementation of the Incident Action Plan. In ICS, it normally includes subordinate Branches, Divisions, and/or Groups." (**FEMA**, *National Incident Management System Draft*, 2007, p.155)

Operations Section: "The Section responsible for all operations directly applicable to the primary mission. Directs the preparation of Branch, Division, and/or Unit operational plans, requests or releases resources, makes expedient changes to the IAP as necessary and reports such to the IC." (**USCG** *IM Handbook* 2006 Glossary 25-19)

OPeriod: Operational Period. (**FEMA**, *Federal Interim CONPLAN: NMSZ*, Dec.15, 2007, 22)

OPEX (Operational Exercise) **1961:** "During the last half of FY 1961, OCDM began a series of quarterly operational exercises (OPEX-Series) principally to check emergency operational procedures and facilities more frequently and to test and exercise key emergency personnel in government more frequently and intensively. OPEX 1961-I, held on January 16, briefly covered the readiness preattack phase and the early stages of a nuclear attack phase. Only selected OCDM staff participated. OPEX 1961-II, held on April 6 and 7, was similar but included Federal agency headquarters and field staffs whose emergency plans require presence at OCDM facilities." (**OCDM**, *Annual Report 1961*, p. 88)

OPHEMC: Office of Public Health Emergency Medical Countermeasures, US HHS.

OPHEP: Office of Public Health Emergency Preparedness, US HHS.

OPLAN: Operations Plan. (**White House**, *Annex I "National Planning,"* HSPD-8, 2007)

OPM: Office of Personnel Management.

OPORD: Operations Order. (**Dept. of the Army**, *WMD CST Operations*, Dec. 2007, p. 2-3)

OPREP: Operations Report. (**Dept. of the Army**, *WMD CST Operations*, Dec. 2007, G-15)

OPS: Office of Operations Coordination, DHS.

OPSEC: Operations Security. (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, p. 33)

OPSG: Operation Stonegarden Grants (**DHS**, *Fact Sheet: FY08 Preparedness Grants*, 1Feb08)

OPSUM: Operations Summary. (**DA**, *WMD-CST Operations*, December 2007, Glossary-5)

OPTEMPO: Operating Tempo. (**DA**, *WMD-CST Operations*, December 2007, Glossary-5)

ORC: Operational Readiness Cycle. (**Dept. of Army**, *WMD-CST Operations*, Dec. 2007, 4-9)

ORCON (Dissemination and Extraction of Information Controlled by Originator): "No further dissemination can occur without the prior approval of the originator." (**FEMA**, *IIFOG Ver 3 Draft*, 2008, p. 35)

Orders of Succession: "Provisions for the assumption of senior agency offices during an emergency in the event that any of those officials are unavailable to execute their legal duties." (**DHS**, *FCD 1*, Nov. 2007, P-8)

ORE: Operational Readiness Evaluation. (**DHS**, *FEMA OMA FY 2009*, 2008, 44)

Organization: "Group of people and facilities with an arrangement of responsibilities, authorities and relationships." (**ISO 22399**, *Societal Security*…, 2007, 5)

Organization and Leadership Capability Element: Collection and analysis of intelligence and information, and development of policies, plans, procedures, mutual aid agreements, strategies, and other publications that comply with relevant laws, regulations, and guidance necessary to perform assigned missions and tasks." (**DHS**, *TCL*, 2007, p. 9)

Organization of Federal Civil Defense, Civil Preparedness, and Emergency Management:

- Federal Civil Defense Administration (FCDA, Executive Office of President, 1950-1951)
- Federal Civil Defense Administration (FCDA, 1951-1958)
- Office of Defense and Civilian Mobilization (ODCM (EOP) 1958)
- Office of Civil and Defense Mobilization (OCDM, EOP, 1958-1961)
- Office of Civil Defense (OCD, Department of Defense, 1961-1964
- OCD (Department of the Army, DoD, 1964-1972)
- Defense Civil Preparedness Agency (DCPA, DoD (1972-1979)
- Federal Emergency Management Agency (FEMA, 1979-present)

(**National Archives**, *Guide to Federal Records*, Records of FEMA, Record Group 311, p. 2)

Organizational Culture: "Organizational culture is critical to understanding implementation outcomes for successful emergency management. Organizational culture is the set of symbols, norms, shared values and beliefs, as well as a pattern of basic assumptions that organizational members have developed in learning to cope with organizational problems of external adaptation and internal integration, thereby teaching new members to perceive, think, and feel in relation to their organizations (Ouichi, 1981; Schein, 1984).[93] In implementing emergency management plans, government agencies need to adopt or consider markedly different styles of thinking and values which are involved in organizational cultures of other organizations. In fact, emergency

[93] Ouichi, William (1981). *Theory Z*, MA: Addison-Wesley. Schein, Edgar (1984). "Coming to a New Awareness of Organizational Culture," *Sloan Management Review* (Winter):3-16.

management emphasizes effective communication patterns for effective interorganizational relationships among relevant organizations. This consensus building is emphasized in emergency management for establishing effective communication among participants." (**Choi**, "Emergency Management: Implications from a Strategic Management Perspective," *Journal of HLS and EM*, Vol. 5, Issue 1, Article 1, 2008, 9)

Organizational Culture: "Core values, a common sense of mission, and a shared philosophy are key elements of an organization's culture." (**PNSR**, *Ensuring Security*…, 2008, p. 80)

Organizational Development and Relationship to Crisis Management: "Organizational development (OD) can be defined as a process calling upon social and behavioural sciences to strengthen abilities and capacities of organizations over the long term to confront changes and to better attain their objectives (Cummings & Worley, 2005). OD is a field of practical application based on a process of accompaniment, initiated either internally or externally (Schein, 1999) and covering a vast panoply of activities (Church & al., 1994, Bazigos & Church, 1997; Worren & al., 1999; Carter & al., 2001, 2005; Rothwell & Sullivan, 2005; French & Bell, 1999): research action; organizational diagnosis at various levels (individual—group—organization); feedback mechanisms for members of the organization (such as "survey feedback," "search conferencing," "coaching," etc.); and the design of interventions at the level of human processes, technostructure, human resource management, global strategy, etc. These methods allow organizational actors to master new knowledge and ways of doing things. This idea of strengthening organizational abilities and capacities is also related to the notion of resilience put forward by Quarantelli (2001) and Rosenthal & Kouzmin (1996). Furthermore, OD may represent what Bourrier (2002) calls the "missing link" and thus address the concern about crisis management over a period of time through reconfiguring interventions and the support structures of these interventions. The field of OD seems to us particularly well-placed to effect this necessary transfer of theoretical knowledge into practice. The literature on organizational learning is vast but that which relates learning and crisis management is rather meagre. Indeed, we know a little more about the types and modes of learning but we do not know whether these apply to crisis management. Finally, the models described to date by researchers have remained rather theoretical and have seldom been applied." (**Lalonde**, "Crisis Management and Organizational Development…," 2007, p. 510)

Organizational Efficiency, Critical Elements Of:

- agreed vision, purpose, and principles;
- processes, procedures, and measurements;
- structure;
- core competencies and necessary capabilities;
- personnel attributes and necessary qualifications;
- leadership attitudes and behavior;
- organizational culture; and
- strategy. (**PNSR**, 2008, 69; cites Mckinsey & Company)

Organizational Response to Disaster, Typology: "…almost all groups that appear in a community emergency can be classified as being one of four possible types."

- Type I: Established – carries out regular tasks
- Type II: Expanding – expanding organization with regular tasks
- Type III: Extending – existing organization undertaking non-regular tasks
- Type IV: Emergent – new group, engages in non-regular tasks."

(**Dynes**, et al, *A Perspective on Disaster Planning* (3rd. Ed.), 1981, p. 58; see also, Warheit and Dynes, *The Functioning of Established Organizations in Community Disasters*, 1968, pp. 35-43)

"The major planning implication of this [is] the need for overall coordination. There are different elements and different groups involved in most community disasters. All of the elements and all of the groups have to be integrated together if there is to be any effective response to an emergency. This requires planning." (**Dynes**, *A Perspective on Disaster Planning* (3rd. Ed.), 1981, p. 67)

ORHUG: Oregon HAZUS Users Group. (**FEMA**, "HAZUS User Groups Success Story: ORHUG, Geologic Hazards and Future Earthquake Damage…." October 23, 2007.

ORISE: Oak Ridge Institute for Science and Education. (**ORISE**, *National Security & EM*)

ORNL: Oak Ridge National Laboratory.

OSA: On-Site Assistance Program (FEMA predecessor agencies). Defunct.

OSC: On-Scene Commander. (**Dept. of the Army**, *WMD CST Operations*, Dec. 2007, p. 2-3)

OSC: Federal On-Scene Coordinator. (**USG,** *Interagency Domestic Terrorism CONPLAN*, 2001, p. 10; see also National Contingency Plan)

OSC: Operations Support Center, HHS/ASPR/OPEO. 2008.

OSCG: On-Scene Control Group. (Arnold AFB, *"Centennial Flight Celebration" EOP*, 2003)

OSD: Office of Secretary of Defense. (**OCD**, *Abbreviations and Definitions*, 1971, p. 4)

OSEM: Office of the Secretary and Executive Management, DHS

OSH Act: Occupational Safety and Health Act.

OSHA: Occupational Safety and Health Administration.

OSINT: Open Source Intelligence. (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, p. 38)

OSTP: Office of Science and Technology Policy. (**DHS**, *FCD 1*, Nov. 2007, p. O-2)

Other Needs Assistance (ONA): "Individual assistance program intended to meet the necessary expenses and serious needs of disaster victims. ONA operates within established grant limits

that are funded through a 75% Federal/25% State cost share." (**FEMA**, *Disaster Basics* (IS-292), May 24, 2007 update, p. A-8 Glossary)

Other Needs Assistance (ONA): "FEMA may provide ONA grant funding for transportation expenses, medical and dental expenses, and funeral and burial expenses. ONA grant funding may also be available to replace personal property, repair and replace vehicles, and reimburse moving and storage expenses under certain circumstances." (**GAO**, *Natural Disasters: Public Policy Options…*, Nov 2007, p. 16)

Otherwise Protected Area (OPA): "Otherwise Protected Area's (OPA's) are generally used for activities such as fish and wildlife research and refuges." [Note: In 1990, Congress passed the Coastal Barrier Improvement Act (CBIA). The CBIA tripled the size of the System established by the Coastal Barrier Resource Act of 1982. The CBIA does not allow the issuance of new Federal flood insurance within "otherwise protected areas" on buildings constructed after November 16, 1991, unless the building is used in a manner related to the reason the area is protected.] (**FEMA**, *CBRS History*, 2006)

Out of Service Resources: "Resources assigned to an incident but unable to respond due to mechanical, rest or personnel reasons." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 56)

Outcome: "The impact an Investment's processes and outputs (direct goods and services produced by the Investment) has on the homeland security program and capabilities; e.g., as the result of 1,000 more firefighters being trained in mass casualty medical response (output), the jurisdiction can now address a potential incident population of 500,000, versus 25,000 prior to training (outcome)." (**DHS**, *Fiscal Year 2007 Homeland Security Grant Program: Investment Justification Reference Guide*, January 2007, p. 54, Appendix A, Definitions)

Output: "Direct products, goods and services produced…" (DHS, *Fiscal Year 2007 Homeland Security Grant Program: Investment Justification Reference Guide*, January 2007, p. 54, Appendix A, Definitions)

Over-the-Road Bus Security Grant Program: "…the purpose of this program is to create a sustainable program for the protection of intercity bus systems and the traveling public from terrorism, especially explosives and nonconventional threats that would cause major loss of life and severe disruption. Grants awarded under this program go directly to the owners and operators of fixed route intercity and/or charter bus services using over-the-road buses to address priorities identified in the NPG, NIPP, and NSTS. Grants are used to improve facility security in defined UASI jurisdictions, passenger and baggage screening, driver and vehicle security along with enhancing emergency communication technology, coordination with local police and emergency responders, and training and exercises. Each of these funding priorities seeks to further enhance prevention and protection against terrorist activities and will greatly serve to assist with response and recovery efforts in the event of an attack." (**FEMA**, *Statement of R. David Paulison, Administrator, on the Fiscal Year 2009 President's Budget Before the Committee on Appropriations Subcommittee on Homeland Security, U.S. House of Representatives*, March 11, 2008, pp. 5-6)

P & A: Personnel and Administrative. (**OCD**, *Abbreviations and Definitions*, 1971, p. 4)

PA: Public Affairs.

PA&E: Program Analysis & Evaluation. (**DHS**, *FEMA OMA FY 2009 Budget*…, 2008, 32)

PA/FA: Program Allocations/Functional Areas. (**FEMA**, *IEMS MYDP*, 1984, p. I-1)

PAC: Public Assistance Coordinator.

PACER: Center for the Study of Preparedness and Catastrophic Event Response. Based at Johns Hopkins University.

Packaged Disaster Hospital (PDH): During the 1950s and 1960s the Federal civil defense program developed and deployed approximately 2,500 Packaged Disaster Hospitals which "These PDHs consisted of modularized, predeployed units for 50, 100, or 200 beds. In 1972, Congress discontinued its support funding for the PDH concept. The 2,500 deployed units were declared to be surplus and were discarded over the next decade. More than three decades later, however, we find ourselves in the interesting position of rediscovering, resurrecting, and refining the concept of ACSs [alternative care sites]." (**AHRQ/HHS**, *Mass Casualty Care*, 2007, 76-77)

Packaged Disaster Hospital (PDH): "The purchase and assembly of 731 200-bed improvised hospitals is currently under way and a considerable number of these will be delivered to storage locations during the current fiscal year. These improvised hospitals will be made available to target areas by automatic issue." (**FCDA**, *1954 Annual Report*, p. 70) "This total is only a modest start towards the 5,000 or more estimated to be needed." (Ibid, p. 106)

The "first public demonstrtion of FCDA's new 200-bed improvised hospital" was in 1954. (FCDA, 1954 Annual Report, p. 91) "FCDA's 200-bed improvised emergency hospital was erected at the national convention of the American Hospital Association, attended by some 7,000 hospital administrators." (**FCDA**, *1954 Annual Report*, p. 98)

"This 200-bed unit is intended to provide early hospitalization of seriously sick and injured casualties as close as possible to the stricken area for lifesaving, initial, and reparative treatment, and emergncy surgery. The improvised hospital can also be used in a natural disaster as well as after an enemy attack. The 200-bed improvised hsopital weighs about 13 ½ tons, occupies about 2,000 cubic feet, consists of about 45 separate packages, crates, and bundles, and is transportable in a single van….Approximately 15,000 square feet of space are required for the hospital. It may be set up in about 4 hours by some 30 professionals and semitrained auxiliaries, with untrained volunteers helping." (**FCDA**, *1954 Annual Report*, p. 107)

Packaged Disaster Hospital (PDH): "At the end of FY 1960, OCDM had 82 civil defense emergency hospitals on loan to States for training pruposes and had prepositioned approximately 1,400 hospital units in 46 States, Puerto Rico, and the Virgin Islands. No additional medical supplies were stockpiled in FY 1960… OCDM and DHEW jointly arranged for transferring

future management of the medical stockpile items to DHEW." (**OCDM**, *Annual Report 1960*, 27)

PACOM: Pacific Command. (**HSGAC**, *Katrina:* A *Nation Still Unprepared*, 2006, 633)

PAG Manual: *Manual of Protective Action Guides and Protective Actions for Nuclear Incidents*, EPA, 1992.

PAHO: Pan American Health Organization.

PAHPA: Pandemic and All-Hazards Preparedness Act. (Public Law 109-417, December 2006)

Palanterra: "…a map-based common operating picture of the National Geospatial-Intelligence Agency…" (Lipowicz, *Washington Technology*, Vol. 21, No. 20, October 16, 2006)

Palliative Care: "Aggressive management of symptoms and relief of suffering is what generally have come to be called "palliative care." The World Health Organization defines palliative care as 'an approach which improves the quality of life of patients and their families facing life-threatening illness, through the prevention, assessment, and treatment of pain and other physical, psychosocial, and spiritual problems'." (**AHRQ**, *Mass Medical Care*, 2007, 104)

Palliative Care Potential Populations: "Most scenarios of catastrophic MCEs [Mass Casualty Events] would create sudden large numbers of fatally injured or critically ill short-term survivors that are at least a few orders of magnitude larger than the existing vulnerable populations. Depending on the event, some victims will last only a few weeks (e.g., pulmonary injury from airborne chemicals) and some may last for months (e.g., pandemic influenza). In many cases, those who survive the onset usually will live for some time – days to months – but will not be "expected to survive" due to the event itself or to the ensuring resource scarcities it creates. Initial identification of those who might fit into the "not expected to survive" category following a catastrophic MCE may include:

- Those exposed to the event who are expected to die over the course of weeks (e.g., those with radiation exposure)
- The "already existing" palliative care population (e.g., those already enrolled in hospice or receiving palliative care in acute care settings)
- Vulnerable patients (e.g., advanced illness patients in long-term care facilities) whose situation will be worsened due to scarcities associated with the event
- Patients who are triaged as a result of scarce resources." (**AHRQ/HHS**, *Mass Medical Care*..., 2007, p. 103)

Palmer Index: "A mathematical representation of drought conditions." (**UNDHA**, *DM Glossary*, 1992, 56)

Pandemic: "An epidemic (a sudden outbreak) that becomes very widespread and affects a whole region, a continent, or the world…. The word "pandemic" comes from the Greek "pan-", "all" + "demos", "people or population" = "pandemos" = "all the people." A pandemic affects all

(nearly all) of the people. By contrast, "epi-" means "upon." An epidemic is visited upon the people. And "en-" means "in." An endemic is in the people." (**MedicineNet.com**, *Definition of Pandemic*, 1998)

Pandemic and All-Hazards Preparedness Act: "In December 2006 Congress passed and the President signed the Pandemic and All-Hazards Preparedness Act (PAHPA), Public Law No. 109-417, which has broad implications for HHS's preparedness and response activities. The Act established within the Department a new Assistant Secretary for Preparedness and Response (ASPR); provided new authorities for a number of programs, including the advanced development and acquisition of medical countermeasures; and called for the establishment of a quadrennial National Health Security Strategy." (**HHS**, *Pandemic and All-Hazards Preparedness Act Progress Report*, November 2007, p. 1)

Pandemic Influenza: "Pandemic (from the Greek, meaning "of all of the people'') Influenza has the potential to pose a far greater threat to global health. It typically is a novel human flu that causes a worldwide outbreak of serious illness and death. Because there is little natural immunity, the disease can easily spread from person to person, one of the key characteristics that defines a pandemic. There have been at least 10 recorded flu pandemics during the past 300 years.4 Three of these occurred during the 20th Century.

1. *The 1918-1919 "Spanish Flu"* was the most devastating flu pandemic in recent history. It killed more than 500,000 Americans and as many as 50 million people globally, according to some estimates. It proved especially lethal to young adults.
2. *The 1957-1958 "Asian Flu"* was first identified in China and killed approximately 1 million people worldwide, including 68,000 Americans.
3. *The 1968-1969 "Hong Kong Flu"* caused about 34,000 deaths in the United States."[94]
(**American Academy of Pediatrics**, *Pandemic Influenza*, October 2007, p. 2)

Pandemic Influenza Containment Strategy: "Containment attempts would require stringent infection-control measures such as bans on large public gatherings, isolation of symptomatic individuals, prophylaxis of the entire community with antiviral drugs, and various forms of movement restrictions—possibly even including a quarantine…if a containment attempt is to have a chance of succeeding, the response must employ the assets of multiple partners in a well coordinated way." (HHS, Pandemic Influenza Plan, 2005, p. 17)

Pandemic Influenza Vaccination Program Goal: "The *goal* of the pandemic influenza vaccination program is to vaccinate all persons in the United States who choose to be vaccinated." (**HHS**, *Draft Guidance on Allocating and Targeting Pandemic Influenza* Vaccine, October 23, 2007)

Pandemic Countermeasure, Containment/Control Strategies:

- Isolation

[94] "Pandemic Influenza: Historical Perspective,'' Center for Infectious Disease Research Policy, Univ. of Minnesota. http://www.cidrap.umn.edu/cidrap/content/influenza/panflu/biofacts/panflu.html#Historical_Perspective_1 8 July 2007.

- Quarantine
- Social Distancing
- Closing Places of Assembly
- 'Snow Days/Weeks' and Furloughing Non-Essential Workers
- Changes in Movement Patterns (**DHS**, *Pandemic Influenza CIKR Guide*, 2006, p. 14)

Pandemic Countermeasure, Containment/Control Strategy, Social Distancing: "Within the workplace, social distancing measures could take the form of: modifying the frequency and type of face-to-face employee encounters (e.g., placing moratoriums on hand-shaking, substituting teleconferences for face-to-face meetings, staggering breaks, posting infection control guidelines); establishing flexible work hours or worksite, (e.g., telecommuting); promoting social distancing between employees and customers to maintain three-feet spatial separation between individuals; and implementing strategies that request and enable employees with influenza to stay home at the first sign of symptoms." (**DHS**, *Pandemic Influenza -- Preparedness, Response, and Recovery: Guide for CIKR*, 2006, p. 14)

Pandemic Influenza Phases:

- New Domestic Animal Outbreak in At-Risk Country
- Suspected Human Outbreak Overseas
- Confirmed Human Outbreak Overseas
- Widespread Human Outbreaks in Multiple Locations Overseas
- First Human Case in North America
- Spread Throughout United States
- Recovery and Preparation for Subsequent Waves. (**DHS**, *Pandemic Influenza CIKR Guide*, 2006, p. 17)

Pandemic Vaccine Prioritization:

Level -- Homeland & National Security (HNS)

A Deployed and mission critical personnel

B Essential support and sustainment personnel
Intelligence services; Border protection personnel
National Guard personnel (not already in Level A)
Other domestic national security personnel

C Remaining active duty military and essential support personnel

Level -- Health Care & Community Support Services (HC/CSS)

A Public health personnel
Inpatient, Outpatient, and home health care providers
Health care providers in long-term care facilities (LTCFs)

B Community support services and emergency management personnel

C Other important health care personnel

Level -- Critical Infrastructure (CI)

A Emergency Medical Services, Fire service and Law enforcement personnel
Manufacturers of pandemic vaccine, antiviral drugs, key pandemic response materials
Key government leaders

B Energy sector personnel (electricity and natural gas)
Communications personnel (telephony and IT)
Water sector personnel (potable and waste water)
Government personnel
C Transportation sector personnel
Food and agriculture sector personnel
Banking and finance sector personnel
Pharmaceutical sector personnel
Chemical and Oil sector personnel
Postal and shipping sector personnel
Other important government personnel

Level -- General Population (GP)

A Pregnant women
Infants and toddlers, 6 – 35 months old
B Household contacts of infants under 6 months old
Children 3 – 18 years old with high-risk medical conditions
Children 3 – 18 years old without high-risk medical conditions
C High risk persons 19 – 64 years old
Persons 65 years and older
D Healthy adults, 19 – 64 years old, not included in other categories.

(**HHS**, *Draft Guidance on Allocating and Targeting Pandemic Influenza Vaccine*, October 2007)

Panic: "Panic behavior is where the individual flees without any consideration for others." (**Dynes, Quarantelli and Kreps**, *A Perspective on Disaster Planning* (3rd Ed.), 1981, p. 19)

Panic: "The surest antidotes to panic are knowledge, training, and leadership. Knowledge of what the danger is. Knowledge of what to do about it—to the point where the proper reaction is instinctive. Knowledge that something is being done about it, by people who know their business. Knowleddge of what is happening, and why – right after it happens. Knowledge that the Nation's leaders are on the job – by seeing nhad hearing them on television and radio." (**FCDA**, *1953 Annual Report*, p. 67)

PAO: Public Affairs Officer.

Paper Plans: "A frequent major weakness [in emergency preparedness] concerns emergency planning. In many communities emergency plans are based upon an assumed capability, rather than on a real or existing capability. While many documented plans 'look good on paper,' it is the actual existing resources and capabilities which must be relied upon to save lives and property. Therefore, it is essential that the emergency plan accurately reflect existing resources and operational capabilities. It is also important to ensure that provisions have been made for making the best possible use of existing resources and capabilities, and where needed, to expand and improve them.

"Also, many written plans reflect more coordinated planning than has actually occurred within the community. Frequently the preparation of emergency plans did not include participation by representatives of appropriate emergency services. During a study of local community

emergency planning,[95] it was discovered that often the local civil preparedness director was, for all practical purposes, the sole author of the plan. For a plan to be workable, it is essential that the users understand what is required of them. This is accomplished best by their actual participation in the planning effort.

"In many cases local emergency operations plans have been produced to satisfy Federal and State requirements for participation in DCPA programs. A great many of these 'compliance plans' represent little or no real planning activity. Many are the result of adopting (mostly filling in blanks) model local plans produced by the States." (**DCPA**, *On-Site Assistance* (MP 63), 1974, pp. 2-3)

PAR: Pressure and Release Model. (**UNDAP**, *Techniques Used in Disaster Risk Asmt.*, 2008)

PAR: Protective Actions and Reentry (DOE).

Parallel Planning: "Parallel planning describes those rare situations when planning occurs concurrently across all Federal Planning levels for a specific scenario or threat. The higher planning level must still lead off the parallel planning effort to inform the next level's planning. The key distinction with parallel planning is that the lower planning level does not have to wait for the higher planning level's approved plan to begin planning. This is essential to speed up the process and allows participating organizations the maximum time to conduct their own planning. Parallel planning relies on accurate and timely notification from the higher planning level and a full sharing of information between planning levels as it becomes available." (**FEMA**, *Interim IPS* (Draft 2.3), July 3, 2008 copy, p. 2-9)

Participatory Analysis: "A risk analysis which includes the affected people in defining problems and needs, deciding solutions to them, implementing agreed activities to achieve those solutions and/or evaluating the results. The benefits of the technique are the growth of capacity, the creation of disaster risk management attitudes and behavior, and a greater insight into the communities enabling better results. In addition participatory analysis may be more cost-effective in the long term, than externally-driven initiatives, partly because they are more likely to be sustainable and because the process allows ideas to be tested and refined before adoption. The limitations of the technique are a poor fit within rigid timetables; impact will be limited at best if only some parts of the community are involved and where participation involves real social change it leads to the possibility of confrontation and conflict with those who traditionally hold power and influence." (**UNDAP**, *Techniques Used in Disaster Risk Assessment*, 2008)

Partner: "Any individual, group, or organization that might be affected by, or perceive itself to be affected by an emergency." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 56)

Partnership: "The concept of partnership…is understood here to encompass ongoing communication and sharing of knowledge, which, in turn, relies on relations of trust and common commitments." (**Fagen and Martin** 2005, 11)

---

[95] Cited is System Development Corporation, *Final Report: Local Planning Project*, April 30, 1970.

Partnership Building: *Joint Forces Quarterly* question*:* You recently commented that you enjoy success coordinating and cooperating with interagency partners. What advice can you offer to commanders and staff officers to achieve similar success?

General Victor Renuart: "The last place in the world to make a new friend is at the scene of a disaster. You have to build a relationship over time. You need to plan together for the events that you may have to practice. And so my first recommendation is to reach out to those other agencies that you may have to deal with. You want to understand how *they* view the world, what *their* culture is. You need to understand what capabilities they bring. By the way, they need to understand what capabilities you bring, so it's a two-way discussion. My experience has been, whether it's building a coalition of 70 nations during OEF [Operation *Enduring Freedom*], or a coalition of 45 agencies at NORTHCOM today, everyone needs to feel as if they are a partner. Each will bring a different capability, some large, some small, but each has to feel like they are integrated into the planning as well as the execution. And so, if you don't make the first move, if the Defense Department doesn't say, "Let us be part of your team," or "Come be part of our team," then it's likely that it won't happen because, often, we're seen as kind of the big dog in the pack, and that can be intimidating to smaller agencies, so we have to make the first move." (***Joint Force Quarterly***, "An Interview with Victor E. Renuart, Jr," Is. 48, 1st Qtr. 2008, p. 42)

Partnership for a Safer Future: "The first Strategic Plan in the history of the Federal Emergency Management Agency (FEMA) was published in 1994. As part of FEMA's renewal, 'Partnership for a Safer Future' laid out the agency's mission and vision. We recognized that FEMA's role in making a safer future would require us to lay a solid foundation on which to build an effective organization of emergency management. We recognized that the organization would need to lead and support the Nation in a comprehensive, risk-based emergency management program. We also recognized that our mission to reduce the loss of life and property included protecting the Nation's institutions from all natural and man-made hazards. FEMA consequently began to direct efforts towards creating an agency that would restore the confidence of the American people and fulfill President Clinton's promise to 'be there' when America needed us." (**FEMA** (Director James L. Witt Foreword) *Strategic Plan FY 1998-2002*)

"Many challenges must be overcome before the vision of a 'Partnership for a Safer Future' becomes a reality. The first challenge is the effectiveness of the emergency management partnership. How well the entire emergency management community functions will affect FEMA's ability to meet the goals and objectives stated in the Plan. Although FEMA provides leadership and coordination, State and local governments are ultimately responsible for protecting their citizens from harm." (**FEMA**, *Strategic Plan FY 1998 – FY 2002*, 1997, p. 37)

Partnership for Public Warning (PPW): "The Partnership for Public Warning is a not-for-profit, public-private partnership established to save the lives and property of people at risk from natural disasters, accidents and terrorism by improving the nation's alert and warning capabilities. PPW provides a collaborative, consensus-based forum where all interested stakeholders – public and private – are working together to develop processes, standards, systems and strategies to ensure that the right people have the right information at the right time. PPW's objectives include, but are not limited to:

• Fostering communication, cooperation and consensus among key stakeholders:
• Promoting and conducting research and studies into alert and warning issues:
• Assisting and advising government officials on the development, implementation and operation of public warning systems, technologies, policies and procedures:
• Supporting the timely generation of standards, specifications, and protocols:
• Encouraging private sector investment in the development of new warning technologies and promoting the existence of such technologies to government decision makers;
• Fostering a knowledgeable public and informed decision making by establishing, maintaining and providing educational materials and other information on warning technologies and programs.

The Partnership is governed by an elected Board of Trustees representing local and state governments, private industry and the non-profit community. Federal agencies participating in PPW include the Department of Homeland Security, Department of Commerce and Federal Communications Commission." (**PPA**, *Protecting America's Communities*, 2004, p. iii)

Partnership Model: "The Partnership Model includes the following steps:

- Identify public and private sector stakeholders to co-share leadership.
- Ask leaders to bring others to the table.
- Identify common issues on emergency preparedness for collaboration.
- Identify new resources in the community to mitigate the impact of critical incidents.
- Determine the challenges that participating organizations encounter.
- Create sustainability in the partnership by conducting a needs assessment, setting goals, and task performance." (**Critical Incident Protocol**, *Partnership Model*)

Pathogens: "Pathogens are disease-causing bacteria, viruses, and rickettsiae. These agents could be used to target food supplies, port facilities, or population centers. Of particular concern is the threat of contagious diseases such as smallpox. Agents that have a long incubation period can infect a large number of people in a short period of time without immediate symptoms or warning signs." (**Dept. of the Army**, *WMD-CST Operations*, December 2007, p. 3-5)

Patriot Reports: "The partnership between the NOC and FBI is growing at a steady pace. For example, the NOC provides Patriot Reports to the FBI which have been useful in developing case leads. These reports often contain unique information provided to the NOC by private citizens." (**DHS**, *Statement of Frank DiFalco, Director of the National Ops. Center*, 20Jun07, 8)

PBL: Problem-Based Learning. (**FEMA**, *TEI/TO Course Catalog*, 2008, 76)

PBSE: Performance-Based Seismic Engineering.

PCA: Posse Comitatus Act.

PCCIP: President's Commission on Critical Infrastructure Protection.

PCI: Property/Casualty Insurers Association of America. (**III**, *Catastrophes: Insurance...*, 2008)

PCIIP: Protected Critical Infrastructure Information Program. (**DHS,** *NIPP* 2006, p. 5)

PCIS: Partnership for Critical Infrastructure Security. "The PCIS membership is comprised of one or more members and their alternates from each of the SCCs [Sector Coordinating Councils]." (**DHS,** *NIPP* 2006, p. 5)

PDA: Preliminary Damage Assessment.

PDD: Presidential Decision Directive.

PDD-39: *US Policy on Counterterrorism*, 21 June 1995.

PDD-62: *Combating Terrorism,* May 22, 1998.

PDD-63: *Critical Infrastructure Protection*, May 22, 1998, The White House. "No later than the year 2000, the United States shall have achieved an initial operating capability and no later than five years from today the United States shall have achieved and shall maintain the ability to protect the nation's critical infrastructures from intentional acts that would significantly diminish the abilities of:

–The Federal Government to perform essential national security missions and to ensure the general public health and safety;

–State and local governments to maintain order and to deliver minimum essential public services;

–The private sector to ensure the orderly functioning of the economy and the delivery of essential telecommunications, energy, financial and transportation services.

Any interruptions or manipulations of these critical functions must be brief, infrequent, manageable, geographically isolated and minimally detrimental to the welfare of the United States." (**DHS**, *Critical Infrastructure Task Force Presentation to HSAC,* January 10, 2006)

PDD-67, *Enduring Constitutional Government and Continuity of government Operations*, 1998.

PDF: Portable Document Format.

PDH: Packaged Disaster Hospital. (**DCPA**, *On-Site Assistance Appendices*, 1974, p.C-14)

PDM: Pre-Disaster Mitigation.

Peacetime Benefits of Civil Defense (1953): "Communities, Cities and States throughout the Nation learned that an organized, trained Civil Defense was an important asset whenever and

wherever natural disaster struck. In 1953 Civil Defense truly became a recognized community service – a new dimension of peacetime citizenship." (**FCDA**, *1953 Annual Report*, p. 1)

"Our local Civil Defense organizations even now are gaining much needed experience – and paying their way – by serving in rescue and relief capacities in time of fire, flood, drought, or tornado damage. I count the dedication of the Federal Civil Defense Administration to these worthy emergency causes as one of the most practicable and forward-looking acts of the new administration." (**FCDA**, *1953 Annual Report*, p. 6)

Peacetime Benefits of Civil Defense (1954): "Increasingly in 1954 civil defense gave effective assistance in natural disasters. The contribution of civil defense was particularly evident in the hurricanes which struck the east coast in the early fall." (**FCDA**, *1954 Annual Report*, p. 1)

"Information on natural disasters such as floods, tornadoes, and cyclones is given over the CADW [Civil Aid Defense Warning] networks. In one instance last year CADW provided the first reports of 'Hurricane Hazel' hitting an area and in another was the only remaining source of communication with an area which had been hit…. Matching funds under FCDA Federal Contributions program have been made available to help States and localities pay the cost of public warning systems equipment. The program also provides matching funds for the installation of warning systems inside schools, hospitals, and public buildings." (**FCDA**, *1954 Annual Report*, pp. 58, 60)

Peacetime Benefits of Civil Defense (1955): "The advantages of having natural and enemy-caused disaster functions combined in the same forces have been demonstrated many times within the past few years. Natural disaster operations have afforded excellent training in organization, leadership, and use of technical skills to those in civil defense whose responsibility it would be to act in an enemy-caused disaster. On the other hand, previous organization and training in civil defense has resulted in increased capability to provide assistance in natural disasters." (**FCDA**, *1955 Annual Report*, p. 39)

PEP: Pre-positioned Equipment Program. **(FEMA**, Statement of Cannon, Nov/ 15, 2007. p. 9)

PEP: Prevention Exercise Program. (**DHS**, *HSEEP*, Vol. V, 2005, p. 5)

PEPAC: Primary Entry Point Advisory Committee. (**FEMA**, *IPAWS Update*, June 2007, 3)

PEP: Primary Entry Point System. (**FEMA**, *IPAWS Update*, June 2007, slide 2)

Performance Activities and Tasks: "Performance activities and tasks are the actions taken to prevent, protect against, respond to, or recover from an actual event or are demonstrated during an exercise." (**DHS**, *TCL*, 2007, p. 8)

Performance Based Seismic Design (PBSD): "The goal of PBSD is to develop practical assessment and design criteria that enable building owners and regulators to select desired performance and/or reliability levels for new construction or for upgrades of existing buildings

that differ from the current building code-based life safety level." (**NEHRP**, *Annual Report*, 2007, p. viii)

Performance Measures: "Performance measures are quantitative or qualitative levels against which achievement of a task or capability outcome can be assessed. They describe how much, how well, or how quickly an action should be performed and are typically expressed in ways that can be observed during an exercise or real event. *The measures and metrics are not standards. They serve as guides and evaluation tools for planning, training, and exercise activities.*" (**DHS**, *TCL*, 2007, p. 8)

Performance Measures, Emergency/Disaster Response:

1) Capability – what can we do?
2) Capacity – how much can we do?
3) Proficiency – how well can we perform?
4) Deployment – how quickly can we deploy capabilities? (**GAO**, *Maritime Security*, Dec. 2007, p. 76, citing NYFD Chief of Counterterrorism and Emer. Prep., Sep 2006)

Peril: " The cause of risk. Perils include such things as fire, flood, earthquake, bad weather, etc." (**Risky Thinking**, *Risk Glossary*, 2007)

Personnel and Administration Expenses (P&E): "Assistance under Public Law 85-606 [1958]… No Federal funds were available during FY 1960 to help pay essential personnel and administrative costs of State and local civil defense organizations as authorized by Public Law 85-606. However, $6 million appropriated for this purpose will be available on Jan. 1, 1961. OCDM has prepared guidance material and standards to ensure effective use of these funds and will implement the program on the effective date." (OCDM, *Annual Report 1960*, p. 59)

Personnel and Administration Expenses [EMPG] (Sec. 613. Contributions for Personnel and Administrative Expenses (42 U.S.C. 5196b): "(a) General authority - To further assist in carrying out the purposes of this title, the Director may make financial contributions to the States (including interstate emergency preparedness authorities established pursuant to section 5196(h) of this title) for necessary and essential State and local emergency preparedness personnel and administrative expenses, on the basis of approved plans (which shall be consistent with the federal emergency response plans for emergency preparedness) for the emergency preparedness of the States. The financial contributions to the States under this section may not exceed one-half of the total cost of such necessary and essential State and local emergency preparedness personnel and administrative expenses." (**Stafford Act**, June 2007 (FEMA 592), p. 61)

Personnel Capability Element (TCL): "Paid and volunteer staff who meet relevant qualification and certification standards necessary to perform assigned missions and tasks." (**DHS**, *TCL*, 2007, p. 9)

Pets Evacuation and Transportation Standards Act 2007 (PETS Act), Public Law 109-308: "On October 6, 2006, the PETS Act was signed into law amending Section 403 of the Stafford Act. Section 403, as amended by the PETS Act, authorizes FEMA to provide rescue, care,

shelter, and essential needs for individuals with household pets and service animals, and to the household pets and animals themselves following a major disaster or emergency." (**FEMA**, *Eligible Costs Relating to Pet Evacuations and Sheltering*, December 27, 2007 update)

This Act requires FEMA to ensure that state and local emergency plans address the needs of individuals with household pets and service animals prior to, during, and following an emergency or major disaster declaration. The Act also authorizes FEMA to study and develop plans that take into account the needs of individuals with pets and service animals prior to, during, and following disasters.

PF: Protection Factor. (**DCPA**, *On-Site Assistance Appendices*, 1974, p. B-9)

PFO: Principle Federal Official. (**HSGAC**, *Katrina:* A *Nation Still Unprepared*, 2006, 633)

PFS: Personal and Family Survival. (**DCPA**, *On-Site Assistance Appendices*, 1974, p. B-38)

PH: Public Health. (**FEMA**, *TIE/TO Course Catalog*, 2008, p. 3)

Phases of Business Continuity/Emergency Management Program Development Process:

- Program Management
  - Obtain Management Support
    - Issue Executive Policy
  - Establish Advisory Committee
    - Appoint Program Coordinator
  - Evaluate Current Program and Capabilities
    - Review Laws and Authorities
  - Establish Goals and Objectives
    - Establish Project Budget, Schedule and Milestones
- Risk Assessment
  - Identify Hazards
  - Determine Likelihood of Occurrence
  - Assess Vulnerability
  - Conduct Impact Analysis
- Prevention & Mitigation
  - Develop Hazard Prevention Strategy
  - Develop Prevention Plan
  - Develop Hazard Mitigation Strategy
  - Develop Mitigation Plan
- Resource Management
  - Establish Resource Objectives
  - Conduct Gap Analysis to Identify Shortfalls
    - Develop Strategy to Overcome Shortfalls
      - Determine Need for Mutual Aid
        - Establish Agreements, if Mutual Aid Needed
  - Maintain Resource Inventory
- Plan Development

    - Emergency Operations/Response
    - Business Continuity and Business Recovery
        - Develop Communications and Warning Capability
        - Implement Incident Management System
        - Establish Emergency Operations Centers
        - Establish Logistics Capability
        - Establish Finance and Administration Procedures
    - Crisis Communications
- Training
    - Assess Training Needs
    - Develop Training and Education Curriculum
    - Implement Training and Education Program
- Exercises, Evaluations, and Corrective Actions
    - Conduct Drills
    - Conduct Exercises
    - Test IT Recovery Plans
    - Conduct Periodic Reviews and Evaluations
    - Conduct Post Incident Critiques
    - Implement Corrective Action Process
- Program Revision
    - Revise Program as Needed. (**Larson**[96], *Implementing NFPA 1600*, 2007, p. 12)

Phases of Business Continuity Planning:

- Project Initiation
- Business Analysis
- Design and Development (Designing the Plan
- Implementation (Creating the Plan)
- Testing
- Maintenance (Updating the Plan) (**DigitalCare**, *State of Oregon BC Workshop*, 2006, 20)

Phases of Civil Defense (Nuclear Attack):

- Pre-event
- Trans-event
- Post-event

Phases of Continuity Implementation Process:

- Readiness and Preparedness
- Activation and Relocation
- Continuity of Operations
- Reconstitution (**DHS**, *FCD 1*, November 2007, p. 12)

Phases of Continuity of Operations (Nuclear Attack):

a. *Pre-attack*:

[96] Cites Donald L. Schmidt, Preparedness, LLC.

That phase that includes all planning and testing of existing facilities, plans and Emergency Action Procedures.

b. *Trans-attack period.*

From initial attack until civil defense personnel determine that radiation levels permit leaving shelters. Essential functions during this period would include at a minimum all FOA generated Essential War Functions…

c. *Post-attack period*.

(1) Immediate phase. Emphasis on recovery, would include:
(a) Continuing survival activities and military operations.
(b) Mobilizing military and civilian resources.
(c) Restoring essential communications and transportation.
(d) Increasing procurement and production of essential items.

d. Long-term phase.

Activities related to rehabilitation, rejuvenation and restructuring from remaining resources." (**USACE**, *Planning and Operations Guidelines, Annex V: Definitions and Common* Terms, 1985, p. V-1)

Phases of Counterterrorism Information Sharing:

- Detection
- Prevention
- Disruption
- Preemption
- Mitigation (**White House**, *EO 13356*, 2004, p. 1)

Phases of Domestic [National] Incident Management (2003): "Policy: (3) To prevent, prepare for, respond to, and recover from terrorist attacks, major disasters, and other emergencies, the United States Government shall establish a single, comprehensive approach to domestic incident management. The objective of the United States Government is to ensure that all levels of government across the Nation have the capability to work efficiently and effectively together, using a national approach to domestic incident management. In these efforts, with regard to domestic incidents, the United States Government treats crisis management and consequence management as a single, integrated function, rather than as two separate functions." (**White House**, *Homeland Security Presidential Directive/HSPD-5, Subject: Management of Domestic Incidents*, February 28, 2003, p. 1)

Thus: **Prevent (Prevention)**
Prepare for (Preparedness)
Respond to (Response)
Recover from (Recovery)

Annex I, "National Preparedness," to HSPD-5, promulgated in December 2007, struck the "phases" noted above and inserted:

Prevent
Protect against
Respond to
Recover from

Phases of Domestic [National] Incident Management (2007): "The National Incident Management System provides a systematic, proactive approach guiding departments and agencies at all levels of government, the private sector, and nongovernmental organizations to work seamlessly to prepare for, prevent, respond to, recover from, and mitigate the effects of incidents, regardless of cause, size, location, or complexity, in order to reduce the loss of life, property, and harm to the environment." (**FEMA**, *NIMS*, August 2007 Draft, p. 1)

Thus:

Prepare for	**(Preparedness)**
Prevent	**(Prevention)**
Respond to	**(Response)**
Recover from	**(Recovery)**
Mitigate	**(Mitigation)**

Phases of Emergency Management (1978/79), Original "Four Phases" (**NGA**, 1978, p. 106):

- **Mitigation,**
- **Preparedness,**
- **Response, and**
- **Recovery.**

Phases of Emergency Management (1993): "Disasters do not just appear one day. Rather they exist throughout time and have a lifecycle of occurrence which must be matched by a series of management phases that include strategies to mitigate hazards, prepare for and respond to emergencies, and recover from their effects.: (**FEMA**, *The Emergency Pgm Mgr*, 1993, 1-5) Thus:

- To mitigate (mitigation)
- Prepare for (preparedness)
- Respond to (response)
- Recover from (recovery)

Phases of Emergency Management (2006): "In support of the primary mission of the Agency, the Administrator shall…lead the Nation's efforts to **prepare for**, **protect against**, **respond to**, **recover from**, and **mitigate against** the risk of natural disasters, acts of terrorism, and other man-made disasters, including catastrophic incidents…" (FEMA 592, June 2007, pp. 94-95; passage from Title V (National Emergency Management) Sec. 503. Federal Emergency Management Agency (6 U.S.C. 313), **Department of Homeland Security Appropriations Act, 2007** (Pub. L. No. 109-295) amending the Homeland Security Act of 2002; pp. 1396-1397 of DHS Appropriations Act.) Thus:

- Prepare for (Preparedness)
- Protect against (Protection)
- Respond to (Response)
- Recover from (Recovery)
- Mitigate against (Mitigation)

Phases of Emergency Management (2006): "…the mission of the Agency [FEMA] is to reduce the loss of life and property and protect the Nation from all hazards by leading and supporting the Nation in a risk-based, comprehensive emergency management system of (A) **mitigation**, by taking sustained actions to reduce or eliminate long-term risks to people and property from hazards and their effects; (B) **preparedness**, by planning, training, and building the emergency

management profession to prepare effectively for, mitigate against, respond to, and recover from any hazard; (C) **response**, by conducting emergency operations to save lives and property through positioning emergency equipment, personnel, and supplies, through evacuating potential victims, through providing food, water, shelter, and medical care to those in need, and through restoring critical public services; and (D) **recovery**, by rebuilding communities so individuals, businesses, and governments can function on their own, return to normal life, and protect against future hazards…" (**Post-Katrina Emergency Management Reform Act of 2006**, Title VI-National Emergency Management (Sec. 503., Federal Emergency Management Agency, para. (c) Administrator, (9) carrying out …), pp. 1398-1399 of DHS Appropriations Act, 2007' emphasis added) Thus:

- **Mitigation**
- **Preparedness**
- **Response**
- **Recovery**

Phases of Emergency Management (2007): "The Federal Emergency Management Agency (FEMA) is the federal agency responsible for leading America's efforts to **prepare for, protect and mitigate against**, **respond to**, and **recover from** the impacts of natural disasters and man-made incidents or terrorist events. (**FEMA**, *Strategic Plan*, 2007, p. 3; emphasis added) Thus:

- Prepare for (**Preparedness**)
- Protect against (**Protection**)
- Mitigate against (**Mitigation**)
- Respond to (**Response**)
- Recover from (**Recovery**)

Phases of Emergency Management (2007): "Our mandate is to reduce the loss of life and property and protect the Nation from all hazards, including natural disasters, acts of terrorism, and other man-made disasters, by leading and supporting the Nation in a risk-based, comprehensive emergency management system of **preparedness**, **protection**, **response**, **recovery**, and **mitigation**." (**FEMA**, *Strategic Plan*, November 2007, p. 5) Thus:

- **Preparedness**
- **Protection**
- **Response**
- **Recovery**
- **Mitigation**

Phases of Emergency Management (2007): "Provide guidance and federal resources to states, territories, tribal nations, and local governments across the Nation to build and sustain the capability **to prevent**, **protect against**, **respond to**, and **recover from** natural disasters, acts of terrorism, and other man-made events or incidents." (**FEMA**, *Strategic Plan*, 2007, p. 13; see, also, p. 18) Thus:

- To Prevent (**Prevention**)
- Protect against (**Protection**)
- Respond to (**Response**)
- Recover from (**Recovery**)

Phases of Emergency Management (2008): "Building on the improvements of 2007 and lessons learned, the Federal Emergency Management Agency (FEMA) moves into 2008 better positioned to help the American people prepare for, mitigate against, respond to and recover from a natural or man-made disaster." Thus:

- **Preparedness**
- **Mitigation**
- **Response**
- **Recovery** (FEMA, *New FEMA 2008 – Moving The Vision Forward*, Jan 2008)

Phases of Emergency Management (2007): "The future of homeland security depends on preparedness initiatives at the local level. In this collection of contributions from public safety professionals, new measures fall into one or more of the **four phases of emergency management,**

- **mitigation,**
- **preparedness,**
- **response and**
- **recovery**." (From 2007 **ICMA** Press brochure description of *Homeland Security: Best Practices for Local Government.*) [Emphasis added.]

Phases of Emergency Management (2004):

- **Reduction**
- **Readiness**
- **Response**
- **Recovery**
  (**New Zealand Ministry of Civil Defense & Emergency Management**, Personal email, 14Jan2004)

Phases of Emergency Management and Business Continuity (2004):

- **Mitigation**
- **Preparedness**
- **Response**
- **Recovery** (**NFPA**, *NFPA 1600*, 2004)

Phases of Emergency Management and Business Continuity (2007):

- **Prevention**
- **Mitigation**
- **Preparedness**
- **Response**
- **Recovery** (**NFPA**, *NFPA 1600*, 2007)[97]

[97] The NFPA explains the addition of "Prevention" to the "Phases" in the last paragraph of the section, "Origin and Development of NFPA 1600" -- "The 2007 edition incorporates changes to the 2004 edition, expanding the conceptual framework for disaster/emergency management and business continuity programs. Previous editions of the standard focused on the four aspects of mitigation, preparedness, response, and recovery. This edition identifies prevention as a distinct aspect of the program, in addition

Phases of Homeland Defense (2005): "DOD primarily focuses on "detect, deter, preempt, and defend" when they conduct HD missions.

- "*Prepare.* Emergency preparedness is a shared responsibility and a partnership that includes the Federal government, state and local agencies, the private sector, and individual citizens.
- *Detect.* Early detection of threats is essential. Detection is a national effort, which involves maintaining a common operational picture and the sharing and fusing of information/intelligence through a network of federal, state, and local agencies.
- *Deter.* An effective deterrence requires the adversary leadership to believe the United States has both the ability and will to preempt or retaliate promptly with responses that are credible and effective.
- *Preempt.* Preemption consists of proactive measures taken to prevent or neutralize a perceived or imminent attack. Preemption may include offensive actions such as air strikes, maritime interception, or direct action.
- *Defend.* HD missions are those that protect the Nation's sovereignty.
- *Respond.* Response, as it relates to HS activities, spans both HD and CS mission areas." (**JCS/DoD**, *Homeland Security* (JP 3-26), 2005, p. vi) Thus:
  - **Prepare**
  - **Detect**
  - **Deter**
  - **Preempt**
  - **Defend**
  - **Respond**

Phases of Homeland Defense (2007):

- **Prepare**
- **Detect**
- **Deter**
- **Prevent**
- **Defense**
- **Defeat**
- **Recover** (**JCS/DOD**, *Homeland Defense*, 2007, p. I-7 (24))

Phases of Homeland Security (2001): "The Office [Homeland Security] shall work with executive departments and agencies, State and local governments, and private entities to ensure the adequacy of the national strategy for detecting, preparing for, preventing, protecting against, responding to, and recovering from terrorist threats or attacks within the United States and shall periodically review and coordinate revisions to that strategy as necessary." (**White House**, *EO 13228*, October 8, 2001). Thus:

- **Detection**

---

to the other four. Doing so brings the standard into alignment with related disciplines and practices of risk management, security, and loss prevention."

- **Preparedness**
- **Prevention**
- **Protection**
- **Response**
- **Recovery**

Phases of Homeland Security (2002): "The *National Strategy for Homeland Security*… creates a comprehensive plan…to enhance our protection and reduce our vulnerability to terrorist attacks…. The strategic objectives of homeland security in order of priority are to:

• Prevent terrorist attacks within the United States;
• Reduce America's vulnerability to terrorism; and
• Minimize the damage and recover from attacks that do occur."
(**White House**, *National Strategy for Homeland Security*, 2002, pp. vi-vii) Thus:

- **Pre-event** -- Prevent **terrorist** attacks Prevention
- **Pre-event** -- Reduce vulnerability to **terrorism** Mitigation & Preparedness
- **Trans-event** -- Respond to **terrorist** attacks Response
- **Post-event** -- Recover from **terrorist** attacks Recovery

Phases of Homeland Security (2004): "We will lead the unified national effort to secure America. We will prevent and deter terrorist attacks and protect against and respond to threats and hazards to the nation. We will ensure safe and secure borders, welcome lawful immigrants and visitors, and promote the free-flow of commerce." (**DHS**, *Strategic Plan* (Mission Statement) 2004) Thus:

- Prevent and deter terrorist attacks (**Prevention**)
- Protect against threats and hazards (**Protection)**
- Respond to threats and hazards (**Response**)

Phases of Homeland Security (2004):
"*Awareness*--Identify and understand threats, assess vulnerabilities, determine potential impacts and disseminate timely information to our homeland security partners and the American public.
Prevention — Detect, deter and mitigate threats to our homeland.
Protection — Safeguard our people and their freedoms, critical infrastructure, property and the economy of our Nation from acts of terrorism, natural disasters, or other emergencies.
Response — Lead, manage and coordinate the national response to acts of terrorism, natural disasters, or other emergencies.
Recovery — Lead national, state, local and private sector efforts to restore services and rebuild communities after acts of terrorism, natural disasters, or other emergencies. (**DHS**, *Securing Our Homeland: U.S. Department of Homeland Security Strategic Plan 2004*.)
Thus: **Awareness**
Prevention
Protection
Response
Recovery

Phases of Homeland Security (2005): "This document summarizes the initial results of significant work completed since December 17, 2003, when President Bush issued Homeland Security Presidential Directive 8: *National Preparedness* (HSPD-8). This approach transforms how the Federal government proposes to strengthen the preparedness of the United States to prevent, protect against, respond to, and recover from terrorist attacks, major disasters, and other emergencies and how the Federal government proposes to invest homeland security resources in order to achieve the greatest return on investment for our Nation's homeland security. It is animated by a sense of urgency and by a commitment to risk-based priorities." (**DHS**, *Interim National Preparedness Goal*, March 2005, Preface)

[Thus: **Prevent (Prevention)**
Protect against (Protection)
Respond to (Response)
Recover from (Recovery)]

Phases of Homeland Security (2007): "Homeland Security is a concerted national effort to prevent and disrupt terrorist attacks, protect against man-made and natural hazards, and respond to and recover from incidents that do occur." (**DHS**, *NRF Comment Draft*, September 2007, p. 6)

Thus:

- Prevent and disrupt terrorist attacks (**Prevention**)
- Protect against man-made and natural hazards (**Protection**)
- Respond to incidents that do occur (**Response**)
- Recover from incidents that do occur (**Recovery**)

Phases of Incident Management: "…phases of incident management:

- prevention,
- preparedness,
- response,
- recovery, and
- mitigation." (**DHS**, *NIMS*, March 2004, p. 2)

Phases of Incident Management: "Incident phases are based on the National Response Framework (NRF) and National Planning and Execution System (NPES) of incident management: prepare, respond and recover aligned with the National Operations Center (NOC) and National Response Coordination Center (NRCC) Operational Phases." (**FEMA**, *DHS/FEMA 2008 Federal Interagency Hurricane Contingency Plan* (Draft). Oct. 31, 2007, p. 2)

Thus: **Preparedness**
Response
Recovery

Phases of Incidents:

- **Awareness**
- **Readiness**
- **Response**
- **Recovery**

(**FEMA**, *IS 250, Emergency Support Function 15 (ESF15) External Affairs: A New Approach to Emergency Communication and Information Distribution*, 2007, p. 46 and Test Question 23)

Phases of Incidents of National Significance: "The *National Response Plan* (NRP) establishes three operational phases: Pre-Incident, Incident, and Post-Incident for all Incidents of National Significance. These phases and their associated steps are driven by events that occur and resultant decisions and not specifically by time." (**DHS**, 2007 forthcoming) Thus:

- Pre- Incident
- Incident
- Post-Incident [See Phases of Civil Defense (Nuclear Attack)]

Phases of National Incident Management: "Common approach to national incident management:

Prevention
Protection
Response
Recovery
Preparedness" (**DHS**, *Interim National Preparedness Goal*, March 2005, p. 2 (Figure 1)

Phases of National Preparedness for All-Hazards (2007):

- **To Prevent**
- **Protect Against**
- **Respond To**
- **Recover From (White House**, *Annex I, "National Preparedness," HSPD-8*, 2007, 2)

Phases of Response: This chapter [II, Response Actions] describes and outlines key tasks related to the **three phases of effective response:**

- **Prepare**
- **Respond**
- **Recover** (**DHS**, *NRF*, Jan 2008, 27)

Phases of Weapons of Mass Effect Prevention of U.W. Border Penetration System:

- **Dissuasion**
- **Deterrence**
- **Detection**
- **Denial**
- **Disruption**
- **Interdiction**
- **Elimination (HSAC,** *WME Task Force*, January 10, 2006, pp. 14-17**)**

PHEMC: Public Health Emergency Medical Countermeasures Enterprise, HHS.

PHEP: Public Health Emergency Preparedness, CDC, HHS.

PHIN: Public Health Information Network, CDC, HHS.

PHMSA: Pipeline and Hazardous Materials Safety Administration, DOT.

PHS: Public Health Service. (**HSGAC**, *Katrina:* A *Nation Still Unprepared*, 2006, 633)

PHSAC: President's Homeland Security Advisory Council.

PI: Pandemic Influenza. (**FEMA**, *FEMA Pandemic Influenza Contingency Plan*, 2007)

PI: Public Information. (**OCD**, *Abbreviations and Definitions*, 1971, p. 4)

PIA: Professional Insurance Agents (association). (**FEMA**, *Call for Issues…Report*, 2000, xxiii)

PID: Photo Ionization Detector. (**Dept. of the Army**, *WMD-CST Operations*, Dec. 2007, B-3)

PIF: Policies in Force. (**FEMA.NFIP**, *Call for Issues Status Report*, 2000, xxiii)

PII: Personally Identifiable Medical Information. (**ACLU**, *Pandemic Preparedness*, 2008, 28)

Pinnacle 05 Exercise: Federal continuity of operations (COOP) exercise, June 20-24, 2005, designed "to test and improve our ability to perform essential governmental functions during threats and emergencies. (**DHS**, *DHS Announces Pinnacle Exercise to Test COOP*, June 2005) Generally, Pinnacle Exercises, as the name might imply, are high level exercise involving the White House Military Office. (**DHS**, *DNDO Exercises*, 2007)

Pinnacle 07 Exercise: May 2007 Continuity of Operations Exercise. (**DOE OIG**, *Inspection Report: DOE's Pandemic Influenza Planning*, Dec 2007, p. 7)

PIO: Public Information Officer. (**OCD**, *Abbreviations and Definitions*, 1971, p. 4)

PIR(s): Priority Intelligence Requirement(s): (**DA**, *WMD-CST Operations*, Dec. 2007, p. 4-6)

PITAC: President's Information Technology Advisory Committee. (February 2005)

PKEMRA: Post-Katrina Emergency Management Reform Act. (**Stafford Act**, 2007, p. 75)

PKEMRA Requirements -- Assessment:

- **"Comprehensive Assessment System:** Assess, on an on-going basis, the Nation's prevention capabilities and overall preparedness, including operational readiness.

- *Shall assess:*
    - Compliance with national preparedness system, NIMS, NRP, other plans

- Capability levels at the time of assessment against target capability levels defined by the TCL
- Resource needs to meet the desired target capability levels defined by the TCL
- Performance of training, exercises, and operations." (**FEMA**, *National Preparedness System: Current Prototype & Proposed Implementation Approach*, August 2, 2007, slide 15)

PKEMRA Requirements -- National Preparedness Report: "National Preparedness Report: By Oct 4, 07 and annually, submit to Congress a report on the Nation's level of preparedness for all hazards.

Report shall include:

- Assessment of how Federal assistance supports the national preparedness system
- Results of the comprehensive assessment
- Review of the Federal Response Capability Inventory
- Assessment of resource needs to meet preparedness priorities established by Administrator in TCL, including
- Estimate of the amount of Federal, State, local, and tribal expenditures required to attain the preparedness priorities
- The extent to which the use of Federal assistance during the preceding fiscal year achieved the preparedness priorities

(**FEMA**, *National Preparedness System: Current Prototype & Proposed Implementation Approach*, August 2, 2007, slide 16)

PKEMRA Requirements – State Preparedness Reports: "By January 4, 2008 and annually, a State receiving Federal preparedness assistance from DHS shall submit a report to the Administrator on the State's level of preparedness.

Report shall include:

- An assessment of State compliance with the national preparedness system, NIMS, NRP, and other related plans and strategies
- An assessment of current capability levels and a description of target capabilities levels
- An assessment of resource needs to meet the preparedness priorities established by Administrator in the TCL, including:
- An estimate of the amount of expenditure required to attain the preparedness priorities
- The extent to which the use of Federal assistance during the preceding fiscal year achieved the preparedness priorities

(**FEMA**, *National Preparedness System: Current Prototype & Proposed Implementation Approach*, August 2, 2007, slide 17)

PKI: Public Key Infrastructure. (**DHS**, *NCR First Responder Partnership Initiative*, 2005, 14)

PL: Public Law. (**OCD**, *Abbreviations and Definitions*, 1971, p. 4)

Places of Mass Gathering: "`Places of mass gathering' …comprise a very diverse group of commercial assets and facilities, typically privately owned and operated, which may include sports venues, amusement parks, concert halls, retail malls, office buildings, residential apartment buildings, and hotelsa nd resorts. These facilities, which make up the Commercial Facilities Sector under the National Infrastructure Protection Plan (NIPP) framework, may be generally characterized by one of four common traits: business activities, personal commercial transactions, recreational pastimes, and accomodations.: (**DHS**, *Statement for the Record, Robert B. Stephan, Assistant Secretary, Infrastructure Protection, National Protection and Programs Directorate…[DHS] before the Committee on Homeland Security*, July 9, 2008, p. 1)

Plan: "A proposed or intended method of getting from one set of circumstances to another. A plan is often used to move from the present situation towards the achievement of one or more objectives or goals." (**DHS**, *FCD 1*, Nov. 2007, P-8)

Plan: "A plan is a continuous, evolving instrument of anticipated actions that maximize opportunities and guide response operations. Since planning is an ongoing process, a plan is an interim product based on information and understanding at the moment, and is subject to revision. That is why plans are best described as "living" documents." (**DHS**, *NRF*, 2008, 71)

Plan, Common Communication Plan – See Common Communication Plan.

Plan, Concept -- See Concept Plan.

Plan, Concept of Operations (CONOPS) – See Concept of Operations Plan.

Plan, Contingency – See Contingency Planning.

Plan, Continuity of Operations (COOP Plan) – See Continuity of Operations Plan

Plan, Continuity of Operations-Essential (COP-E) – See Continuity of Ops Plan-Essential.

Plan, Crisis Action – See Crisis Action Planning

Plan, Crisis Management – See Crisis Management Planning.

Plan, Operational/Operations -- -- See Operations Plan.

Plan, Strategic – See Strategic Plan.

Plan, Tactical – See Tactical Plan.

Planning: "Plans describe how personnel, equipment, and other resources are used to support incident management response activities. Plans provide mechanisms and systems for setting priorities, integrating multiple entities and functions, and ensuring that communications and

other systems are available and integrated in support of a full spectrum of incident management requirements." (**DHS**, *National Incident Management System*, March 2004, p. 4)

Planning: "Outcome: Plans incorporate an accurate threat analysis and risk assessment and ensure that capabilities required to prevent, protect against, respond to, and recover from all-hazards events are available when and where they are needed. Plans are vertically and horizontally integrated with appropriate departments, agencies, and jurisdictions. Where appropriate, emergency plans incorporate a mechanism for requesting State and Federal assistance and include a clearly delineated process for seeking and requesting assistance from appropriate agency(ies)." (**DHS**, *National Preparedness Guidelines*, September 13, 2007, p. 6)

Planning: "Planning is a methodical way to think through the entire life-cycle of a potential crisis. Good planning repays the investment of time and effort in development and rehearsal by shortening the time required to gain control over an incident and by providing favorable conditions for rapid and effective exchange of information about a situation, its analysis, and alternative responses. Planning helps Federal, State, local, tribal, and territorial governments reorient capabilities and resources to be more agile and ensures organizational structures, processes, and procedures effectively support the intended strategic direction. As stakeholders learn and practice their roles, they can reduce uncertainty, expedite response, and improve effectiveness during the critical initial stages after an event. This effort is a key to success in protecting people and property in crises." (**DHS**, *National Preparedness Guidelines*, 2007, 20-21)

Planning: "Planning makes it possible to manage the entire life cycle of a potential crisis, determine capability requirements, and help stakeholders learn their roles. It includes the collection and analysis of intelligence and information, as well as the development of policies, plans, procedures, mutual aid and assistance agreements, strategies, and other arrangements to perform missions and tasks. Planning also improves effectiveness by clearly defining required capabilities, shortening the time required to gain control of an incident, and facilitating the rapid exchange of information about a situation." (**DHS**, *National Response Framework*, 2008, 28)

Planning: "Planning provides three principal benefits: (1) it allows jurisdictions to influence the course of events in an emergency by determining in advance the actions, policies, and processes that will be followed; (2) it guides other preparedness activities; and (3) it contributes to unity of effort by providing a common blueprint for activity in the event of an emergency. Planning is a foundational element of both preparedness and response and thus is an essential homeland security activity. Emergency planning is a national priority, as reflected in the *National Preparedness Guidelines*." (**DHS**, *National Response Framework*, 2008, 71)

Planning: "Planning is the mechanism through which Federal, State, local and tribal governments, non-governmental organizations (NGOs), and the private sector develop, validate, and maintain plans, policies, and procedures describing how they will prioritize, coordinate, manage, and support personnel, information, equipment, and resources to prevent, protect and mitigate against, respond to, and recover from Catastrophic events. Preparedness plans are drafted by a litany of organizations, agencies, and/or departments at all levels of government and within the private sector. Preparedness plans are not limited to those plans drafted by emergency

management planners. The planning capability sets forth many of the activities and tasks undertaken by an Emergency Management planner when drafting (or updating) emergency management (preparedness) plans." (**DHS**, *Target Capabilities List*, 2007, p. 21)

Planning: "Planning should be an orderly, analytical process consisting of logical steps to identify a mission or requirement, develop, analyze, and compare alternate courses of action, select the best course of action, and produce a plan. Planning should also be flexible and responsive to dynamic conditions (e.g. time constraints, varied planning expertise, etc.). Homeland security operations demand the interagency be able to gather, review, integrate, and act upon information rapidly in a knowledge-based, collaborative environment. Collaborative planning allows all levels of government to plan together to synchronize their efforts." (**FEMA**, *(Interim) Integrated Planning System (IPS) for Homeland Security (Draft Version 2.3)*, July 3, 2008 copy, p. 2-1)

Planning: "The plan is important, but of greater importance is the planning, and the experience gained by the planners who may later find themselves in charge. This is why the Guide stresses the importance, where practicable, of placing planning responsibility on the shoulders of those who will actually operate in an emergency." (**OEP**, *Organization and Planning Guide for State & Local Emergency Management of Resources*, Sep 1962, p. 13)

Planning, Adaptive (AP): See "Planning, Adaptive."

Planning, Business Continuity – See Business Continuity Planning

Planning, Capabilities-Based -- See Capabilities-Based Planning Process.

Planning, Catastrophic Disaster Response – See Catastrophic Disaster Response Planning.

Planning, Operational/Operations – See Operational/Operations Plan.

Planning, Response – See National Response Framework, DHS.

Planning, Strategic – See Strategic Plan.

Planning, Tactical – See Tactical Plan.

Planning Approaches: "There are different approaches to planning, each focusing on different requirements, authorities, levels of operation and specific organizational missions within the homeland security spectrum of operations.

Capability-Based. This planning approach focuses on available personnel and resources that can be applied to address significant incidents. Requirements and capabilities are derived from the

National Planning Scenarios, the *National Homeland Security Plan,* strategic planning, risk assessments, concepts of operations, and threat information. This capabilities-based planning approach and the *National Preparedness Guidelines* foster vertical and horizontal integration of Federal, State, local, and Tribal plans allowing State, local and Tribal capability assessments to inform Federal requirements and capabilities planning.

Functional. A functional planning approach identifies a list of common tasks an organization must perform during an incident, an emergency, a specific event/activity or a directed requirement. They are created at all operational levels and formatted in accordance with the standards of the parent organization. They may be developed in response to HSPD/NSPD requirements, at the organization's senior leadership initiative, or in response to either national policy or a guidance document requirement.

Scenario-Based. A scenario-based plan is developed from a National Planning Scenario; there are currently 15 National Planning Scenarios. These scenarios have been grouped into eight sets. National Planning Scenarios will be developed, updated, or amended as necessary at least every two years. This process will be informed by a risk-based analysis intended to focus planning efforts on the most likely or most dangerous threats to the homeland. Annex I to HSPD-8 specifically addresses this planning approach." (**FEMA**, *Interim IPS* (Draft 2.3), July 3, 2008 copy, pp. 2-10, 2-11)

Planning Capability: "The TCL includes a Planning Capability designed to establish and maintain the ability to develop, update, and test plans. In addition, each capability contains both preparedness and performance tasks and measures that support the capability outcome and serve as a guide for preparedness planning. The preparedness tasks and measures describe major elements or issues that should be addressed in plans, procedures, and systems, as well as authorities, relationships, and agreements that need to be in place to prepare to use the capability. The performance tasks and measures also inform the planning process." (**DHS**, *TCL*, 2006, viii)

Planning Capability Element: "Collection and analysis of intelligence and information, and development of policies, plans, procedures, mutual aid agreements, strategies, and other publications that comply with relevant laws, regulations, and guidance necessary to perform assigned missions and tasks." (**DHS**, *TCL*, 2007, p. 9)

Planning Categories/Typologies: "The two basic types of planning are: contingency planning (also known as deliberate planning), and crisis action planning (CAP). Contingency planning is the cornerstone of homeland security planning. It supports crisis action planning by anticipating potential crises and developing plans that facilitate timely selection of courses of action and execution planning during a crisis. Crisis action planning provides the means to transition from normal circumstances to heightened threats, emergency response, and recovery." (**FEMA**, *Interim Integrated Planning System for HLS* (Draft Version 2.3), 3 July 2008 copy p. 2-8)

Planning Criteria For Measuring Key Aspects For Success: "The *Framework* [NRF] employs common criteria to measure key aspects of response planning:

Acceptability. A plan is acceptable if it can meet the requirements of anticipated scenarios, can be implemented within the costs and timeframes that senior officials and the public can support, and is consistent with applicable laws.

Adequacy. A plan is adequate if it complies with applicable planning guidance, planning assumptions are valid and relevant, and the concept of operations identifies and addresses critical tasks specific to the plan's objectives.

Completeness. A plan is complete if it incorporates major actions, objectives, and tasks to be accomplished. The complete plan addresses the personnel and resources required and sound concepts for how those will be deployed, employed, sustained, and demobilized. It also addresses timelines and criteria for measuring success in achieving objectives, and the desired end state. Completeness of a plan can be greatly enhanced by including in the planning process all those who could be affected.

Consistency and Standardization of Products. Standardized planning processes and products foster consistency, interoperability, and collaboration.

Feasibility. A plan is considered feasible if the critical tasks can be accomplished with the resources available internally or through mutual aid, immediate need for additional resources from other sources (in the case of a local plan, from State or Federal partners) are identified in detail and coordinated in advance, and procedures are in place to integrate and employ resources effectively from all potential providers.

Flexibility. Flexibility and adaptability are promoted by decentralized decisionmaking and by accommodating all hazards ranging from smaller-scale incidents to wider national contingencies.

Interoperability and Collaboration. A plan is interoperable and collaborative if it identifies other plan holders with similar and complementary plans and objectives, and supports regular collaboration focused on integrating with those plans to optimize achievement of individual and collective goals and objectives in an incident." (**DHS**, *NR*F, 2008, 74-75)

Planning Fundamentals: "The challenge of planning for protecting lives, property, and the environment within is made easier if the planners apply these common characteristics to the planning process:

- **Planning is an orderly, analytical, problem-solving process.** It follows logical steps from plan initiation to analysis of objectives, to development and comparison of ways to achieve the objectives, and to selection of the best solution. While using a prescribed planning process cannot guarantee success, inadequate plans and planning are proven contributors to failure.

- **Planning guides preparedness activities.** It provides a common framework to guide preparedness by establishing the desired end state and the tasks required to accomplish it. This process identifies the capabilities required. Capabilities provide the means to accomplish a mission and achieve desired outcomes by performing critical tasks, under specified conditions, to target levels of performance. Exercises provide opportunities to demonstrate and evaluate performance, while periodic assessments of plans identify lessons learned and provide the means to share best products and practices.

- **Planning helps deal with complexity.** Homeland security problems are most often complex and interrelated. The National Strategy for Homeland Security attaches special emphasis to planning for catastrophic events that embody the greatest risk of mass casualties, massive property loss and immense social disruption. Planning provides the opportunity for a jurisdiction or regional response structure to work through these very complex situations and their unique associated problems. Planning helps decision makers understand how their decisions might affect the ability of their and neighboring jurisdictions to achieve response goals.

- **This planning process addresses all hazards.** The causes of incidents across the spectrum of homeland security can vary greatly, but the effects do not. This means planners can address incident functions common to all hazards. For example, floods, wildfires, and hazardous materials releases may lead a jurisdiction to issue an evacuation order. Even though each hazard's characteristics (e.g., speed of onset, size of the affected area) are different, many general tasks for conducting an evacuation are the same. Differences in the speed of onset may influence when an evacuation order is given, but the process of issuing an evacuation order does not change. All-hazards planning ensures that planners identify common tasks and determine who is responsible for accomplishing those tasks.

- **Planning does not need to start from scratch**. Planners should capitalize on the experiences of others. The State is a valuable resource for the local jurisdiction. Many States publish their own standards and guidance for emergency planning, conduct workshops and training courses, and assign their planners to work with local planners. By reviewing existing emergency or contingency plans, planners can:
    - Identify applicable authorities and statutes,
    - Gain insight into community risk perceptions,
    - Identify organizational arrangements used in the past,
    - Identify mutual aid agreements with other jurisdictions, and
    - Learn how some planning issues were resolved in the past.

- **Planning depicts the anticipated environment for action.** This promotes early understanding and agreement on planning assumptions and risks, and provides the context for interaction. Effective planning identifies clear tasks and purposes, promotes frequent interaction among stakeholders, guides preparedness activities, establishes procedures for implementation, provides measures to synchronize actions, and allocates or reallocates resources. Planners should review the existing plans for questionable assumptions, inaccuracies, inconsistencies, omissions, and vagueness. Critiques of recent operations and exercises in the jurisdiction will help planners develop a list of topics to address when updating plans.

- **Planning must involve *all relevant* partners.** Just as coordinated operations depend on teamwork, good planning requires a team effort. The most realistic and complete plans are prepared by a team that includes representatives of the Federal agencies, State, local, and Tribal governments, private sector representation, and nongovernmental organizations (NGOs) that will have to execute the plan.

- **Planning assigns tasks, allocates resources, and establishes accountability.** Decision makers must ensure planners have the resources needed to accomplish the planning requirements as well as provide the necessary organizing, staffing, equipping, and resource allocation to implement the plans. Decision makers ensure this by organizing, staffing, equipping, and allocating resources.

- **Planning includes senior officials throughout the process to ensure both understanding and buy in.** Potential planning team members have many day-to-day concerns. For a team to come together, potential members must be convinced that planning has a higher priority, and the person to convince them is the jurisdiction's chief executive. Planning helps decision makers anticipate and think critically, reducing time between decisions and actions. The more involved decision makers are in planning, the better the planning product is. This includes reminding the chief executive that planning is an iterative, dynamic process that ultimately facilitates his or her job in an emergency.

- **Planning is influenced by time, uncertainty, risk, and experience.** These factors define the starting point where planners apply appropriate concepts and methods to create solutions to particular problems. Since this involves judgment and balancing of competing demands, plans cannot be overly detailed, followed to the letter, or so general that they provide insufficient direction.

- **Planning not only tells those within the planning community what to do (the task) and why to do it (the purpose), it also informs those outside the jurisdiction about how to cooperate and provide support and what to expect.** Planning identifies important constraints (what "must be done") and restraints (what "must not be done") that affect freedom of action and expectations.

- **Planning is fundamentally a risk management tool.** Uncertainty and risk are inherent in response planning and operations. Risk management during planning identifies potential hazards and assesses the probability and severity of each to mission accomplishment. Decision makers determine and communicate acceptable levels of risk."

(**FEMA,** *(Interim) Integrated Planning System (IPS) for Homeland Security (Draft Version 2.3)*, July 3, 2008 copy, pp. 2-4 through 2-6)

Planning Organizations (Permanent and Temporary): "Homeland security's complex and demanding nature requires a permanent planning organization with dedicated and trained planners.

- The permanent planning organization's purpose is the continuous planning that addresses the homeland security requirements to prepare the Nation for potential terrorist attacks, natural disasters, and other emergencies. The planners in this organization must have the skills and judgments normally gained through an extensive education, training, and assignment background. The planning organization will be routinely augmented by functional subject matter experts and liaisons from organizations that have a role in the homeland security operations being planned. Permanent planning organizations will often

require additional duty planners that provide unique subject matter expertise to particular planning efforts. The leadership of the permanent planning organization must ensure these planners are trained and integrated into the planning effort seamlessly.

- Temporary planning organizations are formed for limited times to achieve limited planning objectives. They may be repeatedly formed and disbanded, or organized as exceptional circumstances require. However, these organizations should contain one or two members whose full-time role is planning and can facilitate the organization's planning effort." (**FEMA,** *(Interim) Integrated Planning System (IPS) for Homeland Security (Draft Version 2.3)*, July 3, 2008 copy, p. 2-11)

Planning Process: See, also, "Emergency Operations Plan, Planning Process."

Planning Process: "There are many ways to produce an EOP. The planning process that follows has enough flexibility for each community to adapt it to its unique characteristics and situation….The steps of this process are to:

1. Form a collaborative planning team;
2. Conduct research;
3. Analyze the information;
4. Determine goals and objectives;
5. Develop and analyze courses of action,, identify resources;.
6. Write the plan;
7. Approve and implement the plan;
8. Exercise the plan and evaluate its effectiveness; and.
9. Review, revise, and maintain the plan."

Planning Process:

1. Ascertain Authority
2. Ascertain Hazards
3. Ascertain Jurisdiction Assignment
4. Determine local government Structure and Operations
5. Determine capability of:
    1. Local Government
    2. Support Agencies
6. Analyze functions required in each hazard applicable.
7. Assign functions to appropriate department of government by order of Executive.
8. Prepare plan with the assistance of department specialists.
9. Obtain approval of plan by executives.
10. Meet with all departments. Revise plan. Distribute.
11. Periodically review, update, amend plan. Distribute changes. (**DCPA,** *Local Disaster Preparedness Course Syllabus*, 1973, p. 59)

Planning Process: Incident Decision Making Process is a five phase – nine step process:

- Phase 1 – Understand the Situation
    - Mission Identification
- Phase 2 – Determine Objectives and Strategies

    - Mission Analysis
    - Course of Action Development
- Phase 3 – Plan Development
    - Course of Action Analysis
    - Course of Action Comparison
    - Course of Action Approval
- Phase 4 – Plan Preparation
    - Plan/Order Preparation
    - Rehearsal/Training
- Phase 5 – Plan Refinement
    - Plan Refinement (**DHS**, *Interagency Planning Workshop*, 29Nov07, slides 4, 8)

Planning Process: "*Emergency planning is an orderly, analytical problem-solving process.* It follows a set of logical steps from

> plan initiation and analysis of an objective; to
> development and comparison of ways to achieve that objective; and
> selection and description of the proposed solution.

Rather than concentrating on every detail, an effective plan provides basic structure and supports insight, creativity and initiative in the face of an uncertain and fluid environment. While using a prescribed planning process cannot guarantee success, inadequate plans and planning are proven contributors to failure. Effective planning assigns clear tasks and purposes, promotes frequent interaction among stakeholders, guides preparedness activities, establishes procedures for implementation, provides measures to synchronize actions and allocates or reallocates resources." (**DHS**, *NRF Comment Draft*, September 2007, p. 69)

Planning Process:

- Form Local Emergency Planning Committee
- Begin to Plan
    - Review and Coordinate Existing Plans
    - Assess Response Capabilities
        - Assess Industry Response Capabilities
        - Assess Community Response Capabilities
    - Conduct Hazards Analysis
- Develop plan
- Seek Plan Concurrence through State Emergency Response Commission
- Revise, Test, and Maintain Plan (**EPA**, *Technical Guidance for Hazards* Analysis, 1987, p. 1-2)

Planning Process: "The four steps of the planning process are:

- Hazard Analysis.
- EOP Development.
- Testing the Plan.
- Plan Maintenance and Revision." (**FEMA**, *Emergency Planning* IS-235, 2007, p. 2.16)

Planning Process: "Through the planning process, you can identify the hazards that threaten your community, assess your vulnerability to them, and build consensus on approaches to mitigating them. This process leads to the identification of cost-effective, environmentally sound mitigation measures. In fact, the planning process is so critical to implementation of effective mitigation measures that some of the programs, described previously, that are intended to fund mitigation measures, require a mitigation plan as a condition of such funding. The planning process is as important as the plan itself. Your community can follow a general 10-step process that incorporates the classic planning approach of gathering information, setting goals, reviewing alternatives, and deciding upon which actions to take. The steps are:

1. Organize to prepare the plan. Selecting the right person to lead the planning effort is important.
2. Involve the public. Emphasize participation of key stakeholders, including at-risk homeowners, business owners, managers of critical facilities, and technical staff.
3. Coordinate with other agencies and organizations. They can provide technical assistance and inform the community of relevant activities and programs that can support your efforts.
4. Assess the hazard. Identify the particular hazards affecting your community and the risks they pose to your community's critical infrastructure.
5. Evaluate the problem. Getting participants to agree on a problem statement is the first step in reaching consensus on solutions to the problem.
6. Set goals. Establish goals as positive and achievable statements that people can work towards.
7. Review possible strategies and measures. Include a range of hazard mitigation measures for consideration. While some measures may be quickly eliminated, others should be evaluated carefully to determine how they work as well as their costs and benefits.
8. Draft an action plan. Keep it brief. Include sections on how the plan was prepared, recommended mitigation actions, and a budget and schedule.
9. Formally adopt the plan. Gaining public acceptance is vital to reducing conflicts, building support for the recommendations, and getting the plan formally adopted. Keep the public informed and educated so they will readily accept the plan.
10. Implement, evaluate, and revise the plan. Develop procedures to measure progress, assess strengths and weaknesses, and decide on necessary changes." (**FEMA**, *The Planning Process: The Foundation of Disaster Resistance*, September 14, 2006, p.2)

Planning Process: "Regardless of which process is used, the basic procedures are the same for both adaptive, deliberate and crisis action planning:

- receive and analyze the task to be accomplished
- review the enemy situation and begin to collect necessary intelligence
- develop and compare courses of action
- select a course of action (COA)
- develop and get approval for the selected COA
- prepare a plan
- then document the plan." (**JFSC**, *Joint Transition Course: Planning Primer*, 2005, p. 1-7)

Planning Process: "Although no one planning tool or template can provide the breadth of guidance needed, this planning guide is offered as a multifunctional tool or template. It outlines

13 essential components of an effective community-based emergency management planning process and provides multiple planning strategies addressing each component. The components include the following:

1. Define the community.
2. Identify and establish the emergency management preparedness and response team.
3. Determine the risks and hazards the community faces.
4. Set goals for preparedness and response planning.
5. Determine current capacities and capabilities.
6. Develop the integrated plan.
7. Ensure thorough communication planning.
8. Ensure thorough mental health planning.
9. Ensure thorough planning related to vulnerable populations.
10. Identify, cultivate, and sustain funding sources.
11. Train, exercise, and drill collaboratively.
12. Critique and improve the integrated community plan.
13. Sustain collaboration, communication, and coordination. (**The Joint Commission**, *Standing* Together, 2005, p. 6)

Planning Process (Adaptive Planning):

- Strategic Guidance
- Concept Development
- Plan Development
- Plan Refinement/Supporting Plan Development (**JFSC**, *JTC Planning Primer*, 2005, 1-35)

Planning, Programming, Budget and Execution (PPBE): "The Historical Context: In the early part of the 20th century, the federal budget process emphasized the control of actual expenditures. Budget estimates were totals of expenses for items such as salaries, spare parts, or office supplies. DoD lacked a mission or functional structure to classify costs. In addition, the DoD system was highly decentralized, and resource formulation and allocation processes across the services were duplicative, inequitable, and limited to consideration of a single budget year. In the 1940s and 50s, a number of reforms shifted the focus from budget estimates to performance measurement. Performance measures of effectiveness were developed (for example, "miles of road paved per day"), and the budget was based upon functions, activities, and projects. However, there still did not exist a systematic way to ensure that the budget supported the mission or plans of DoD. Consequently, when the budget changed hands or when new issues were given precedence, objectives or planned courses of action changed also, thwarting continuity from year to year.

"*PPBS Introduced to Improve the Budgeting Process*: The Planning, Programming, and Budgeting System (PPBS) had its birth in 1962 under then Secretary of Defense Robert McNamara. Proponents of PPBS believed that efficiencies and improvements in government operations could be achieved through a common approach for:

- Establishing long-range planning objectives
- Analyzing the costs and benefits of alternative programs that would meet those objectives
- Translating programs into budget and legislative proposals and long-term projections.

"PPBS differed from the traditional budgeting process that preceded it in two significant ways.

- *Emphasized objectives*—PPBS focused less on the existing base and annual incremental improvements to it, and more on the objectives and long-term alternative means for achieving them. As a result of this shift in focus, PPBS was elevated to a level on par with budgetary management and control.
- *Linked planning and budgeting*—by means of programming, PPBS instilled a process that essentially defines a procedure for distributing available resources equitably among the many competing or possible programs.

"*PPBS Becomes PPBE—A Focus on Execution*: PPBS imposed financial discipline, integrated the information necessary to develop effective programs to address existing and emerging needs, and established a disciplined review and approval process. However, DoD's processes for strategic planning, identifying needs for military capabilities, developing and acquiring systems, and developing programs and budgets continued to exist as disparate systems.

"The strategic planning process did not explicitly drive the identification of needs for military capabilities. Also, the program and budget development processes, while imposing fiscal discipline, often have failed to integrate strategic decisions into a coherent defense program. In addition, more time was being spent on deciding how much to spend on a program rather than evaluating what was received for the investment.

"In 2003, Defense Planning Guidance (DPG) tasked the Senior Executive Council to lead a study and identify improvements that could be made to DoD decision-making and budgeting process. Known as the DPG 20 Streamlining Decision Process, the study recommended a process that became known as Planning, Programming, Budgeting, and Execution (PPBE). Concurrent with the new planning, programming, and budgeting processes, PPBE set forth a two-year budget cycle, which allows DoD to formulate two-year budgets and use the Off-Budget year to focus on budget execution and evaluate program performance.

"PPBE provides a vehicle for decision makers to examine and analyze decisions by taking into consideration influencing environmental factors such as threats, political and economic climates, technological developments, and resource availability. The processes within PPBE are based on and are consistent with the objectives, policies, priorities, and strategies derived from National Security Decision directives, and shift DoD's focus from straight financial discipline to increased attention and emphasis on program performance and results.

"With the introduction of PPBE, a major thrust of DoD moving forward is to increase the effectiveness of the programming and budgeting process and to place significant importance on budget execution. Specific emphasis is on linking any major decision both to the Defense Planning Guide and to program and budget development, and then evaluating the performance results.

"The new PPBE process guides DoD in developing strategy; identifying needs for military capabilities; planning programs; estimating, allocating, and acquiring resources; and other decision processes. In addition, the change more closely aligns DoD's internal cycle with external requirements embedded in statutes and administration policy.

"*PPBE…The Bridge Between Military Planning and Budgeting*: PPBE is the primary vehicle for identifying mission requirements and translating them into budget and personnel resources required to accomplish that mission. Through the evaluation of alternatives, PPBE ensures the highest priority requirements are funded. Thorough reviews during each phase of the process ensure that major issues (mission-readiness, quality-of-life for military personnel, modernization, Administration priorities, and legislative initiatives) have been addressed within the constraints of total DoD resources.

"The process itself is flexible enough to reflect the political priorities and management focus of the Secretary and Deputy Secretary of Defense while still providing a rigorous and comprehensive means to ensure that all essential issues are considered in the resource allocation process. Because of the new two-year cycle, PPBE allows the budget to be adapted to each Administration's priorities and policies, while still providing for review, refinement, execution, and continuation of the Administration's programs.

"The ultimate objective of PPBE is to provide Operational Commanders with the best mix of forces, equipment, and support attainable within fiscal constraints. Based on the anticipated threat, a strategy is developed. Requirements of that strategy are then estimated and programs are developed to execute the strategy. Finally, a budget is developed to pay for the programs." (**DOD, OSD Comptroller iCenter**, *PPBE*) [Note: Noted and detailed in that FEMA in FY 2008 and 2009 is adopting the PPBE process.]

Planning Section: "The section that is responsible for the collection, evaluation, and dissemination of tactical information related to the incident, and for the preparation and documentation of incident action plans. The section also maintains information on the current and forecasted situation, and on the status of resources assigned to the incident." (**USCG**, *IM Handbook*, 2006, Glossary 25-19)

Planning Support Systems: "Planning support systems are a class of decision support systems that planners employ to help ensure they consider all viable options, weigh their potential value correctly, make and present recommendations, and make sound decisions. Planning support systems are a complement to, not a substitute for, individual and team skills and judgment. These support systems should be interoperable to ensure transparency of planning efforts across jurisdictions. Planning support systems include:

Communication Systems. Supporting communications systems must handle data, video, and voice, and process classified and unclassified information.

Planning Tools. Planning tools fall into two categories--automated and manual.

- Automated Planning Tools. Local systems should, to the maximum extent possible, be compatible with networked systems. Standardized firewalls, access protocols, and common software should be maximized. At the least, local systems must be worked to a common understanding and differences accommodated well in advance of need.

- Manual Planning Tools. Manual planning tools should be available to and understood by as much of the planning community as possible. Niche systems that are understood by

only a small pocket of planners generally lead to misunderstanding and confusion in the rest of the community, which leads directly to disjointed action." (**FEMA,** *(Interim) Integrated Planning System (IPS) for Homeland Security (Draft Version 2.3)*, July 3, 2008 copy, pp. 2-11 – 2-12)

Planning Team: "An effective EOP planning team displays the following characteristics:

- A common goal (development of the EOP)
- A leader who provides direction and guidance
- Open communication
- Constructive conflict resolution
- Mutual trust
- Respect for each individual and his or her contributions." (**FEMA,** *Emergency Planning* IS-235, May 24, 2007, p. 2.16)

Planning Typologies/Categories: "The two basic types of planning are: contingency planning (also known as deliberate planning), and crisis action planning (CAP). Contingency planning is the cornerstone of homeland security planning. It supports crisis action planning by anticipating potential crises and developing plans that facilitate timely selection of courses of action and execution planning during a crisis. Crisis action planning provides the means to transition from normal circumstances to heightened threats, emergency response, and recovery." (**FEMA**, *Interim Integrated Planning System for HLS* (Draft Version 2.3), 3 July 2008 copy p. 2-8)

Plans: "Documents such as procedures, mutual aid agreements, strategies, and other publications that may describe some of the following: governance, management, standard operating procedures, technology, and activities in support of defined missions and tasks." (**FEMA**, *FY 2007 NIMS Compliance Metrics Terms of Reference*, October 23, 2006, p. 2)

Plate Tectonics: "The scientific theory that the Earth's outer shell is composed of several large, thin, relatively strong "plates" that move relative to one another. Movements on the faults that define plate boundaries produce most earthquakes." (**USGS**, *Putting Down Roots*, 2007, Glossary)

PLE: Principles-Level Exercises. (**FEMA**, *Statement of Dennis Schrader*, October 2007, p. 3)

Plume: Identifiable stream of air with a temperature or composition different from that of its environment. Examples are a smoke plume from a chimney and a buoyant plume rising by convection from heated ground. (**WMO** 1992, 456)

PMCS: Preventative Maintenance Checks and Services. (**DA**, *WMD-CST Operations*, 2007, Glossary-5)

PMEFs: Primary Mission Essential Functions. (**White House,** *HSPD-20*, May 9, 2007)

PM ISE: Program Manager, Information Sharing Environment. http://www.ise.gov/

PMF: Probable Maximum Flood. (**USACE**, *Digest of Water Resources Policies*…, 1999)

PMO: Property Management Officer. (**FEMA**, *Mission Assignment SOPs*, July 2007, p. 6)

PMP: Probable Maximum Precipitation (**USACE**, *Water Resources Policies…*, 1999, 13-2)

PMTL: Protective Measures Target List.

PNPs: Private Nonprofit Organizations. (**FEMA**, *Public Assistance Guide*, June 2007)

PNSR: Project on National Security Reform.

PNWER: Pacific NorthWest Economic Region.

POC: Point of Contact. (**DHS**, *FCD 1*, Nov. 2007, p. O-2)

POD: Pacific Ocean Division, United States Army Corps of Engineers.

PODs: Points of Distribution Sites. (**FEMA**, *Logistics Supply Chain*, 2006)

POI: Plan of Instruction. (**OCD**, *Abbreviations and Definitions*, 1971, p. 4)

POE: Port of Entry. (**DHS**, *Opening Statement of Vayl Oxford (DNDO)*, March 8, 2007)

Points of Distribution (PODs) Sites: "Temporary local facilities at which commodities are distributed directly to disaster victims. PODs are operated by the affected state." (**FEMA**, *Logistics Supply Chain*, 2006)

Political Jurisdictions in the United States (See "Governments in the United States").

Political Will: "The greatest challenge facing emergency preparedness is one of political will: Mustering the courage to spend political capital and scarce dollars on stopping a problem before it appears. In the past, policy-makers have preferred to wait for problems to develop and then fund solutions instead of prevention. But Hurricane Katrina has shown that that gamble is not worth the risks." (**Little Hoover Commission**, *Safeguarding the Golden State*, 2006, 64)

PONAST: Post Nuclear Attack Study.

Population at Risk: "A well-defined population whose lives, property, and livelihoods are threatened by given hazards. Used as a denominator." (**UNDHA**, *DM Glossary*, 1992, 58)

Population Threat Assessment (PTA) DHS: "The PTA estimates the size of the population exposed by the agents identified in the MTDs to gauge the impact on the population and national infrastructure if that particular agent was released for a given high consequence plausible scenario." (**DHS**, *Statement for the Record by Runge*, April 18, 2007) [Note: see Material Threat Determination.]

Port Security Assessment (PSA) Program. "The mission of the Coast Guard Port Security Assessment (PSA) Program is to improve port security. We will do this by making federal, state, and local governmental agencies and other appropriate port stakeholders aware of the susceptibility of maritime critical infrastructure and key assets to negative consequences from subversive acts of terrorism, and to recommend mitigation strategies to protect our national port system and the United States public." (USCG, *Port Security Assessment Program*)

Port Security Assessment (PSA) Program. "PSGP supports sustainable, risk-based efforts to enhance access control and credentialing, protect against IED and other non-conventional attacks, and conduct disaster-response scenarios. PSGP funds are awarded on the basis of risk and competition to eligible ports, as well as eligible ferry systems." (**DHS**, *Fact Sheet FY08 Preparedness Grants*, 1Feb2008)

Port Security Grant Program (PSG): "PSG funds owners and operators of ports, terminals, as well as port authorities and state and local agencies that provide a layered approach, U.S. inspected passenger vessels and ferries, as well as port authorities and State and local agencies to improve security for operators and passengers through physical security enhancements. The Program strives to create a sustainable, risk-based effort for the protection of critical infrastructure from any incident that would cause major disruption to commerce and significant loss of life." (**DHS/ODP**, *FY 2006 EMPG Program Guidance*, November 2005, p. 10)

Port Security Grant Program (PSGP): "…provides grant funding to port areas for the protection of critical port infrastructure from terrorism. PSGP funds are primarily intended to assist ports in enhancing port-wide risk management capabilities, enhanced domain awareness, capabilities to prevent, detect, respond to and recover from attacks involving improvised explosive devices (IEDs) and other non-conventional weapons, as well as training and exercises. PSGP funds are allocated to the Nation's highest risk port areas to address priorities identified in NPG, the NIPP and the National Strategy for Maritime Security. The pool of eligible port applicants has been expanded to reflect the changes required by the SAFE Port Act, which states that all entities covered by an Area Maritime Security Plan may submit an application for consideration. PSGP funds support the development of an integrated risk-based decision-making process for each port area patterned after the risk management framework articulated in the NIPP. At the recommendation of the U.S. Coast Guard, in several cases, multiple port areas have been grouped together to reflect geographic proximity, shared risk and a common waterway." (**FEMA**, *Statement of R. David Paulison, Administrator, on the Fiscal Year 2009 President's Budget Before the Committee on Appropriations Subcommittee on Homeland Security, U.S. House of Representatives*. March 11, 2008, p. 5)

Position Task Books (FEMA): "FEMA Task Book is a list of tasks for a defined position /function in the FEMA JFO Organizational structure. Task Books are created in 2 formats: Job Aid (downloaded or handed to employee at check-in); Assessment Guide (supervisor/employee assessment at completion of assignment). The Task Book (in either format) describes your functions in a disaster operation; the Tasks in the Job Aid are identical to those in the Assessment Guide. As mentioned above, every employee should receive the Job Aid when they check-in at the JFO or other Field site. The employee should review the tasks in the Job Aid with their supervisor to ensure all position-specific tasks (or only some of them) will

be performed on that assignment. The Job Aid is intended to be used during his/her assignment, as a desk reference. When the employee completes their assignment, the supervisor and employee will assess the task performance of the employee; this is when the Assessment Guide is used. In the Assessment Guide, there are 3 indicators:

- Performed
- Needs Improvement
- N/A (Not Applicable for this assignment)…

that allow the supervisor to evaluate task performance against each task. The supervisor will rate the employee's performance of every task in the Position Task Book… The assessment process: documents your performance of required tasks; helps you plan for development and improvement of your work performance." (**FEMA**, *Position Task Book*, 2007)

Position Task Books (Purpose): "Position task books have been developed for positions within the FEMA Disaster Workforce. Each task book lists the essential tasks for the specific position. Task books are designed to: Describe the tasks to be performed for a given position; Determine training needs of individual employees; Serve as a tool for promoting task-related." (**FEMA**, *Position Task Book Purpose*, 2007)

Positive Pressure Self-Contained Breathing Apparatus (SCBA): "This apparatus provides a constant, positive pressure flow of air within the facepiece, even if one inhales deeply while doing heavy work. Use apparatus certified by NIOSH and the Department of Labor/Mine Safety and Health Administration in accordance with 42 CFR Part 84. Use it in accordance with the requirements for respiratory protection specified in OSHA 29 CFR 1910.134 (Respiratory Protection) and/or 29 CFR 1910.156 (f) (Fire Brigades Standard). Chemical-cartridge respirators or other filtering masks are not acceptable substitutes for positive pressure self-contained breathing apparatus. Demand-type SCBA does not meet the OSHA 29 CFR 1910.156 (f)(1)(i) of the Fire Brigades Standard." (**DOT**, *Emergency Response Guidebook*, 2004, p. 350)

Posse Comitatus Act: "The PCA prohibits the U.S. military from providing direct support to domestic civilian law enforcement.[98] Therefore, as a general rule, the PCA restricts Marines from acting in a civilian law enforcement capacity, allowing neither execution of civilian law nor direct participation in civilian searches, seizures, or arrests. The PCA does not bar *all* military support to civilian law enforcement. Statutory exceptions allow military assistance to law enforcement in certain limited scenarios. One such scenario is a civil disturbance mission most recently played out during the 1992 Los Angeles riots. Under the Insurrection Act,[99] Congress authorized the President to use the federal military to restore order during times of civil disturbance, to include fulfilling a law enforcement function, without running afoul of the PCA.

---

[98] Citation: 18 U.S.C. § 1385 (2002). Congress enacted the PCA in 1878 as a result of concerns over the military presence in the Reconstruction South. On its face the current PCA only applies to the Army and Air Force. In 1981, however, Congress directed the Secretary of Defense to promulgate regulations to essentially apply the PCA to the Navy and Marine Corps. See 10 U.S.C. § 375 (2002). The resulting regulation is *DoD Directive 5525.5, DoD Cooperation With Civilian Law Enforcement Officials*, 15 January 1986. Of note, the PCA does not apply to the members of the National Guard unless they have been federalized.

[99] Citation: 10 U.S.C. §§ 331–34 (2002).

The civil disturbance Garden Plot RUF[100] reflect this more permissive legal background. For example, Garden Plot allows the military to restore order by apprehending civilians who have committed crimes.[101] Moreover, while not firmly settled, it is generally agreed that the PCA does not apply outside the United States. The military, therefore, can, unhindered by the PCA, develop overseas operational ROE that permit a significant military role in host-nation civilian law enforcement if the mission so requires." (**Center for Law and Military Operations and HQ Marine Corps, Judge Advocate Division**…, *ROE v. RUF*, 2006)

Posse Comitatus Act: "The **Posse Comitatus Act**, 18 U.S.C. 1385, prohibits the use of the Army or the Air Force for law enforcement purposes, except as otherwise authorized by the Constitution or statute. This prohibition applies to Navy and Marine Corps personnel as a matter of DOD policy. The primary prohibition of the Posse Comitatus Act is against direct involvement by active duty military personnel (to include Reservists on active duty and National Guard personnel in Federal service) in traditional law enforcement activities (to include interdiction of vehicle, vessel, aircraft, or other similar activity; a search or seizure; an arrest, apprehension, stop and frisk, or similar activity)." (**DHS**, *National Response Plan* (Draft #1), February 25, 2004, p. 69)

Posse Comitatus Act (Title 18 USC, Section 1385): "This federal statute places strict limits on the use of federal military personnel for law enforcement. Enacted in 1878, the PCA prohibits the willful use of the US Army (and later, the US Air Force) to execute the laws, except as authorized by the Congress or the US Constitution. Although the PCA, by its terms, refers only to the Army and Air Force, DOD policy extends the prohibitions of the Act to US Navy and Marine Corps forces, as well. Specifically prohibited activities include: interdiction of a vehicle, vessel, aircraft, or similar activity; search and/or seizure; arrest, apprehension, "stop-and-frisk" detentions, and similar activities; and use of military personnel for surveillance or pursuit of individuals, or as undercover agents, informants, investigators, or interrogators. Additionally, federal courts have recognized exceptions to the PCA. These common law exceptions are known as the "military purpose doctrine" and the "indirect assistance" exceptions. Exceptions and/or circumstances not falling under PCA include:
(1) Actions that are taken for the primary purpose of furthering a military or foreign affairs function of the United States.
(2) Federal troops acting pursuant to the President's Constitutional and statutory authority to respond to civil disorder.
(3) Actions taken under express statutory authority to assist officials in executing the laws, subject to applicable limitations.
(4) CD operations authorized by statute. The PCA does not apply to NG forces operating in state active duty or Title 32 USC status, nor to the USCG, which operates under Title 14 USC authority." (**JCS/DoD**, *Civil Support*, 2007, p. F-2)

Posse Comitatus Act: "The Posse Comitatus Act does not apply to the National Guard when in state active duty or federal Title 32 service because the Guard is under the command and control of the Governor and the Adjutant General in both statutes. It does apply to the Guard when in

[100] "Rules for the use of force," for domestic support to civil authority missions and "nonoperational" force protection.
[101] Citation: Garden Plot, supra note 5, at ann. C, app. 1, para. (1)(C).

Title 10 service, however, because when the Guard is federalized under Title 10 it becomes an indistinguishable part of the federal forces and is under federal as opposed to state control." (**Lowenberg**, "Statement by Major General Timothy Lowenberg," April 24, 2007)

Post-Disaster Sustainability Mission Statement: "To promote and facilitate sustainable redevelopment at the local level by integrating the principles and practices of sustainable development into the broader goals of the post-disaster recovery process. This is accomplished in partnership with the state and in coordination with OFAs, local agencies, and NGOs." (**FEMA**, *Rebuilding For A More Sustainable Future: An Operational Framework*, Nov. 2000, p. 1-1)

Post Incident Critique: "The critique can be a powerful tool for effecting change. A noted fire service expert observed that, "the post incident critique allows emergency responders to get a clear idea of the effects of their actions on the outcome of the operation. By comparing the expected outcome to the actual consequences, the fire department can make personal as well as organizational adjustments. And by assessing what worked, and what did not, improvements can be made."

A critique is a fact-finding exercise and a chance to relate and record pieces of information that collectively form a picture of the event and how personnel responded from both a command (tactical) and line (operational) standpoint. It is a tool to assess firefighting, rescue, and training effectiveness, and should include tactical plans and command decisions accompanied by how well they were followed. Lessons learned from the experience should be used constructively to correct deficiencies and influence training and education. Changes made to the department's plans and procedures typically occur per the outcome of incident critiques. Management must be willing to act upon the lessons learned and correct the problems as quickly as possible; otherwise, subordinate personnel will think the critique process is a waste of time, and future critiques could suffer accordingly.

The term "critique" may carry a negative connotation for some personnel in the fire service. Critiquing an incident may be perceived as a way to assign blame for mistakes that were made. The postincident critique, (or perhaps a less threatening term such as debriefing, after-action review, or postincident analysis (PIA)) should be viewed as a constructive way to obtain helpful feedback and positive suggestions. The process should be considered an important tool for improving firefighter safety and health, as well as a means for ensuring that the public is receiving quality services." (**USFA**, *Special Report: The After-Action Critique: Training Through Lessons* Learned, 2008, p. 1)

The following are examples of the inherent value of critiques and what they can accomplish:

• provide emergency service personnel with a clear indication of the impact their actions had on the general outcome of an incident;

• used to analyze and compare how different applied strategies and tactics affect the outcome of incidents;

• identify trends and patterns in errors during emergency operations so that immediate action can be taken to prevent them from reoccurring;

• identify positive outcomes that reflect proper attention to procedures, good decisionmaking, leadership skills, and so forth;

• serve as a catalyst for revising flawed tactical plans and Standard Operating Procedures (SOPs);

• used as a test bed where alternative tactics and evolutions are attempted, and to study their effect on the outcome of the incident;
• help identify additional or remedial training for personnel;
• used as technical reference material and cataloged for retrieval and examination during any similar future incidents;
• disseminate critical lessons learned during an incident…." (Ibid., p. 2)

Post-Katrina Emergency Management Reform Act (PKEMRA) (Title VI of the Department of Homeland Security Appropriations Act, 2007, Pub. L. 109-295, 120 Stat. 1355 (2006)): The PKEMRA "clarified and modified the Homeland Security Act with respect to the organizational structure, authorities, and responsibilities of FEMA and the FEMA Administrator. In addition to these modifications, PKEMRA made changes – some appearing in the Homeland Security Act and the Stafford Act – directing FEMA, among other things, to:

• Establish a Disability Coordinator and develop guidelines to accommodate individuals with disabilities;

• Add disability and English proficiency to the list of provisions requiring nondiscrimination in relief and assistance activities;

• Establish the National Emergency Family Registry and Locator System to reunify separated family members and assist in establishing the National Emergency Child Locator Center to locate missing children after a major disaster or emergency;

• Coordinate and support precautionary evacuations and recovery efforts;

• Provide transportation assistance for relocating and returning individuals displaced from their residences in a major disaster;

• Provide rescue, care, shelter, and essential needs assistance to individuals with household pets and service animals as well as to such pets and animals;

• Provide case management assistance to identify and address unmet needs of victims of major disasters;
:
• Note: Federal agencies shall not: deny or impede access to the disaster site to an essential service provider whose access is necessary to restore and repair an essential service; or impede the restoration or repair of essential services, to include telecommunications service, electrical power, natural gas, water and sewer services, or any other essential service, as determined by the President; and

• Receive input from a National Advisory Council, including State and private sector members, about the development and revision of the National Response Framework and other related plans or strategies." (**DHS**, *National Response Framework List of Authorities and References* (Draft), September 10, 2007, p. 4) [Note: See References section for URL for the Post Katrina…Act.]

Post-Katrina Emergency Management Reform Act (PKEMRA):

- "FEMA is responsible for leading the nation efforts to prepare for, protect against, respond to, recover from, and mitigate against the risk of natural disasters, acts of terrorism, and other man-made disasters, including catastrophic incidents.

- Develop a Federal disaster response capability that can act effectively and rapidly to deliver assistance essential to saving lives and protecting or preserving property or public health and safety.

- Provide funding, training, exercises, technical assistance, planning, and other assistance to build Tribal, State, regional, and national disaster response capabilities.

- Develop and coordinate the implementation of a risk-based, all-hazards national strategy for preparedness." (**FEMA**, *Catastrophic Disaster Planning 2007 IAEM Presentation*, 2)

Post-Katrina Emergency Management Reform Act (PKEMRA): "In September 2006, Congress passed the Post-Katrina Emergency Management Reform Act of 2006 ("the Act"), which President Bush signed into law in October 2006.

The Act, which implemented many of the recommendations from the Committee's investigation, creates a new FEMA - with responsibilities, missions, capabilities, and resources far exceeding those of FEMA at the time of Hurricane Katrina – by vesting greater autonomy and elevating the status of FEMA and its leaders within the Department. Among other things, unlike its predecessor, the new FEMA is: (1) a distinct entity within DHS, with protections similar to those afforded the U.S. Coast Guard; (2) focused on all-hazards preparedness, protection, mitigation, response, and recovery; and (3) responsible for the entire cycle of emergency management, including the management of close to $2 billion in grants to help State and local officials and first responders prepare for terrorist attacks and natural disasters.

In debating the Act, Congress decided to strengthen FEMA within the Department of Homeland Security in recognition of the fact that the kinds of catastrophic disasters the nation must prepare for requires resources far beyond what FEMA can effectively marshal standing alone. The Act's goal is to better enable FEMA to coordinate effectively the substantial response resources in other components within the Department, such as the Coast Guard, as well as to enable FEMA to be more effective in coordinating the response assets of the rest of the Federal government.

….the Act gave FEMA and its Administrator elevated and expanded roles in leading the nation's efforts to prepare for, protect against, respond to, recover from, and mitigate against the risk of natural disasters, acts of terrorism, and other man-made disasters. It made the FEMA Administrator an Executive Level II official (equivalent to the level of Deputy Secretary) and the principal advisor to the President, the Homeland Security Council, and the Secretary of Homeland Security on emergency management. It also gave the President the authority to make the FEMA Administrator a cabinet member during disasters. These changes are designed to ensure that FEMA has the political authority and clout to direct and coordinate the appropriate

personnel and resources within DHS (which are substantial) and to coordinate across the Federal government when needed." (**Lieberman**, "Letter to DHS Secretary Chertoff," Oct. 22, 2007)

Potential Threat Element (PTE): "Potential threat elements are any group or individual in which there are allegations or information indicating a possibility of the unlawful use of force or violence, specifically the utilization of WMD, against persons or property to intimidate or coerce a government, the civilian population, or any segment thereof, in furtherance of a specific motivation or goal, possibly political or social in nature. *Following are examples of threat element factors:*

- PTE existence
- PTE violent history
- PTE intentions
- PTE WMD capabilities, and
- PTE targeting
- Motivation of each PTE
- Identification of the WMD capabilities of PTE." (**DHS**, *UASI FY Grant App*, 2004, B-1)

POTUS: President of the United States.

Power Failure: "Any interruption or loss of electrical service due to disruption of power generation or transmission caused by accident, sabotage, natural hazards, equipment failure, or fuel shortage….The HICA defines a 'significant' power failure as any incident which would require the involvement of the local emergency management organization to coordinate provision of food, water, hearing, etc." (**FEMA**, *Hazard Identification* (CPG 1-34), 1985, A-3)

PP: Program Paper. (**OCD**, *Abbreviations and Definitions*, 1971, p. 4)

PPA: Performance Partnership Agreements, FEMA. [Defunct]

PPA: Program, Project, or Activity. (DHS Appropriations Accounting Category)

PPBE: Planning, Programming, Budget and Execution. (**DHS**, *FEMA FY09 OMA*, 2008, 33)

PPE: Personal Protective Equipment.

PPPA: Office of Prepredness Planning and Analysis**,** FEMA, NPD. (**FEMA**, The Office of PPPA, June 26, 2008)

PPW: Partnership for Public Warning.

PRC: Primary Receiving Center.

Precaution: "Action taken to anticipate, identify and reduce the impact of 'surprises' (unknown impacts and therefore unknown probabilities)." (**European Environment Agency**, *EEA*

Environmental Glossary; cites: **EEA**, *Late Lessons From Early Warnings: The Precautionary Principle 1896-2000*, 1991)

Precautionary Approach: "A decision to take action, based on the possibility of significant environmental damage, even before there is conclusive, scientific evidence, that the damage will occur." (**European Environment Agency**, *EEA Environmental Glossary*; cites: **European Commission** (Brussels), *Integrating Environmental Concerns into Development and Economic Cooperation*, 1999.

Precautionary Prevention: "Action taken to reduce potential hazards." (**European Environment Agency**, *EEA Environmental Glossary*; cites: **EEA**, *Late Lessons From Early Warnings: The Precautionary Principle 1896-2000*, 1991)

Precautionary Principle: "(1) Principle adopted by the UN Conference on the Environment and Development (1992) that in order to protect the environment, a precautionary approach should be widely applied, meaning that where there are threats of serious or irreversible damage to the environment, lack of full scientific certainty should not be used as a reason for postponing cost-effective measures to prevent environmental degradation. (2) The precautionary principle permits a lower level of proof of harm to be used in policy-making whenever the consequences of waiting for higher levels of proof may be very costly and/or irreversible." (**European Environmental Agency**, *EEA Environmental Glossary*; cites: 1) **ETC/CDS,** *General Environmental Multilingual Thesaurus* (GEMET 2000); 2) **EEA**, 1999, *Environment in the European Union at the turn of the century*, p. 278. Environmental assessment report No 2)

Precursor: "Phenomenon indicating a probable occurrence of an earthquake or a volcanic eruption." (**UNDHA**, *DM Glossary*, 1992, 58)

Pre-declaration Department of Defense (DOD) Mission Assignment: "Also known as 403(c) assistance. FEMA may direct DoD to use its personnel and equipment for removal of debris and wreckage and temporary restoration of essential public facilities and services, when requested by the Governor of an affected State within 48 hours of the incident. The Assistant Administrator, Disaster Operations Directorate, may authorize 403(c) assistance." (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 2007, p. 57)

Pre-Designated Incident Locations & Facilities (NIMS): "Various types of operational locations and support facilities are established in the vicinity of the incident to accomplish a variety of purposes. Typical pre-designated facilities include command post, bases, camps, staging areas, mass casualty triage areas, and others as required." (**FEMA**, *National Incident Management System National Standard Curriculum Training Development Guidance*, 2005, p.8)

Pre-Designated Principal Federal Official (PFO): "In certain scenarios, a PFO may be pre-designated by the Secretary of Homeland Security to facilitate Federal domestic incident planning and coordination at the local level outside the context of a specific threat or incident. A PFO also may be designated in a pre-incident mode for a specific geographic area based on threat and other considerations. (**DHS**, *Notice of Change to the National Response Plan* (Version 5.0), May 25, 2006, p. 5)

Pre-Disaster Emergency Declaration Requests: "States immediately threatened with impact from an existing *hurricane* or *typhoon* will be considered for an emergency declaration when, in addition to the State request complying with requirements set forth in 44 CFR 206.35, FEMA determines the following three requirements are also met: The National Weather Service determines that the State, or a portion thereof, is threatened by landfall of a major hurricane or typhoon, AND:

1. The Governor has declared a State of Emergency, AND:
2. Either:

a. The State, or any jurisdiction(s) thereof, has issued *mandatory* evacuation orders for three or more counties/parishes, or any geographical area with a combined population of more than 100,000 residents, OR:

b. The declaration is necessary to provide direct federal assistance (e.g., teams, equipment, supplies) to meet critical emergency protection requirements before landfall, other than pre-positioning, that would overwhelm the capability or capacity of State resources.

"States immediately threatened by *any other natural or man-made incident* that threatens such destruction as could result in a major disaster (except fires, for which emergency assistance is provided under the provisions of the Fire Management Assistance Grant program in 44 CFR part 204) will be considered for an emergency declaration when, in addition to the State request complying with requirements set forth in 44 CFR 206.35, FEMA determines the following three requirements are also met:

1. A qualified Federal government agency - acknowledged as a national authority in a specific incident field (e.g., United States Geological Survey for seismic incidents, the National Weather Service for tsunamis, the Nuclear Regulatory Commission for nuclear power plants, or the Department of Homeland Security for acts of terrorism) - determines or affirms that a catastrophic incident is immediately imminent, AND:
2. The Governor has declared a State of Emergency, AND:
3. Either:

a. The State, or any jurisdiction(s) thereof, has issued *mandatory* evacuation orders for three or more counties/parishes, or any geographical area with a combined population of more than 100,000 residents, OR:

b. FEMA determines that the scope of the potential or projected incident is such that it would or could result in such damage as would constitute a catastrophe; AND the declaration is necessary to provide direct federal assistance (e.g., teams, equipment, supplies) to meet critical emergency protection requirements before impact, other than pre-positioning, that would overwhelm the capability or capacity of State resources." (**FEMA**, *Pre-Disaster Emergency Declaration Requests*, July 18, 2007)

Pre-Disaster Hazard Mitigation (42 U.S.C. 5133): "The President may establish a program to provide technical and financial assistance to States and local governments to assist in the implementation of predisaster hazard mitigation measures that are cost-effective and are designed to reduce injuries, loss of life, and damage and destruction of property, including damage to critical services and facilities under the jurisdiction of the States or local governments." (**Stafford Act**, June 2007 (FEMA 592), p. 17)

Pre-Disaster Mitigation (PDM) Program: "The Pre-Disaster Mitigation (PDM) program provides funds to states, territories, Indian tribal governments, communities, and universities for hazard mitigation planning and the implementation of mitigation projects prior to a disaster event. Funding these plans and projects reduces overall risks to the population and structures, while also reducing reliance on funding from actual disaster declarations. PDM grants are to be awarded on a competitive basis and without reference to state allocations, quotas, or other formula-based allocation of funds." (**FEMA**, *Pre-Disaster Mitigation Grant Program*, September 12, 2007 update)

Pre-Disaster Mitigation (PDM) Program Eligible Activities:

Mitigation planning activities:

- New plan development;
- Comprehensive review and update.

Mitigation project activities:

- Voluntary acquisition of real property (*i.e*. structures and land, where necessary) for conversion to open space in perpetuity;
- Relocation of public or private structures;
- Elevation of existing public or private structures to avoid coastal or riverine flooding;
- Structural retrofitting and non-structural retrofitting (*e.g.*, storm shutters, hurricane clips, bracing systems) of existing public or private structures to meet or exceed applicable building codes relative to hazard mitigation;
- Construction of safe rooms (*e.g.,* tornado and severe wind shelters) for public and private structures that meet the FEMA construction criteria in FEMA 320 "Taking Shelter from the Storm" and FEMA 361 "Design and Construction Guidance for Community Shelters";
- Hydrologic and Hydraulic studies/analyses, engineering studies, and drainage studies for the purpose of project design and feasibility determination included as part of a project subapplication;
- Vegetation management for natural dune restoration, wildfire or snow avalanche;
- Protective measures for utilities (*e.g.,* electric and gas), water and sanitary sewer systems and/or other infrastructure (*e.g.,* roads and bridges);
- Storm water management projects (*e.g.,* culverts and retention basins) to reduce or eliminate long-term risk from flood hazards; and
- Localized flood control projects, such as certain ring levees and floodwall systems that are designed specifically to protect critical facilities (defined as Hazardous Materials Facilities, Emergency Operation Centers, Power Facilities, Water Facilities, Sewer and Wastewater Treatment Facilities, Communications Facilities, Emergency Medical Care Facilities, Fire Protection, and Emergency Facilities) and that do not constitute a section of a larger flood control system.

Any of the above mitigation projects for a critical facility, as defined above, may include the purchase of a generator or related equipment purchases (*i.e*., generator hook-ups) as a functional portion to the larger eligible mitigation project subapplication, as long as the generator or related

equipment purchase directly relates to the hazard(s) that threatens the critical facility." (**FEMA**, *Pre-Disaster Mitigation (PDM) Program Guidance Fiscal Year 2008*, 2007, p. vi.)

Preferred Risk Policy (PRP): "The Preferred Risk Policy (PRP) offers low-cost coverage to owners and tenants of eligible buildings located in the moderate-risk B, C, and X Zones in NFIP Regular Program communities." The Preferred Risk Policy covers one- to four-family buildings. (**FEMA**, *Preferred Risk Flood Insurance – A Smart Buy*, 2003)

Preliminary Damage Assessment (PDA): "A mechanism used to determine the impact and magnitude of damage and the resulting unmet needs of individuals, businesses, the public sector, and the community as a whole. Information collected is used by the State as a basis for the Governor's request for a Presidential declaration, and by FEMA to document the recommendation made to the President in response to the Governor's request. PDAs are made by at least one State and one Federal representative. A local government representative familiar with the extent and location of damage in the community often participates; other State and Federal agencies and voluntary relief organizations also may be asked to participate, as needed." (**FEMA**, *Guide For All-Hazard Emergency Operations Planning* (SLG 101), 1996, p. GLO-8)

Preliminary Damage Assessment (PDA): A process used to determine the impact and magnitude of damage and the resulting unmet needs of individuals, businesses, the public sector, and the community as a whole. Information collected as a result of the PDA process is used by the State as a basis for the Governor's request for Federal assistance under the Stafford Act, and by FEMA to document the recommendation made to the President in response to the Governor's request. In a particularly fast-moving or clearly devastating disaster, the PDA process may be deferred until after the declaration." (**FEMA**, *Mission Assignment SOPs*, 2007, p. 58; see 44 CFR 206.33)

Preliminary Damage Assessment (PDA) Damage Definitions (FEMA):

Destroyed - structure is a total loss or damaged to such an extent that repairs are not economically feasible. Any one of the following may constitute a status of destroyed:

- Repair of structure is not economically feasible;
- Structure is permanently uninhabitable;
- There is a complete failure of major structural components (collapse of walls or roof); or
- Unaffected structure will be required to be removed or demolished due to ordinance (e.g., beachfront homes removed due to severe beach erosion).

Major – structure has sustained structural or significant damage, is uninhabitable and requires extensive repairs. Any of the following may constitute major damage: Substantial failures to structural elements of the residence (e.g., walls, floors, foundations);

- Damage to the structure exceeds the Disaster Housing Program, Home Repair Grant maximum ($10,000);
- General exterior property damage exceeds the Disaster Housing Program Home Repair Grant maximum (e.g., roads and bridges, wells, earth movement) and has more than 50% damage to the structure; or
- Damage will take more than 30 days to repair.

Minor – structure is damaged and uninhabitable, but may be made habitable in a short period of time with home repairs. Any of the following may constitute minor damage:

- Structure can be repaired within 30 days;
- Structure has more than $100 of eligible habitability items through the Disaster Housing Program, Home Repair Grant; has less than $10,000 of eligible habitability items through the Disaster Repair Program, Home Repair Grant; or
- Damage repair costs are less than 50% of total value of house.

Affected – structures sustain some damage to structure and contents but which are habitable without repairs, and damage to habitability items is less than Disaster Housing Program, Home Repair Grant minimum. (**FEMA**, *Use of HAZUS-MH to Support Individual Assistance Program*, January 29, 2007 modification)

Preliminary Hazard Analysis: (See "Hazard Analysis, Preliminary")

Preparation: "Activities undertaken in advance of an emergency, including developing operational capabilities, training, preparing plans and improving public information and communications systems." (**Little Hoover Com**., *Safeguarding the Golden State*, 2006, 6)

Preparedness: "…for the purposes of this report, the committee uses the term "preparedness" to include the full breadth of preparedness-related activities, that is, the activities that range from prevention to recovery that are performed by all relevant organizations, including the many levels of governmental and community organizations." (**Altevogt**, *Research Priorities in Emergency Preparedness and Response for Public Health Systems: A Letter Report*, Jan08, 10)

Preparedness: "Preparedness within the field of emergency management can best be defined as a state of readiness to respond to a disaster, crisis, or any other type of emergency situation. It includes that activities, programs, and systems that exist before an emergency that are used to support and enhance response to an emergency or disaster." (**Bullock & Haddow** 2005, 181)

Preparedness: "Definition: activities necessary to build, sustain, and improve readiness capabilities to prevent, protect against, respond to, and recover from natural or man-made incidents. Extended Definition: activities and measures designed or undertaken to prepare for or minimize the effects of a natural or man-made hazard upon the civilian population, to deal with the immediate emergency conditions that would be created by the hazard, and to effectuate emergency repairs to, or the emergency restoration of, vital utilities and facilities destroyed or damaged by the hazard; is a continuous operationally focused process for establishing guidelines, protocols, and standards for planning, training and exercises, personnel qualification and certification, equipment certification, and publication management. Annotation: Preparedness is a continuous process involving efforts at all levels of government and between government and private sector and nongovernmental organizations to identify threats, determine vulnerabilities, and identify required resources to prevent, respond to, and recover from major incidents. Preparedness refers to the existence of plans, procedures, policies, training, and the resources and equipment necessary at the Federal, State, local and tribal level to maximize the ability to prevent, respond to, and recover from incidents." (**DHS**, *Lexicon*, **2007**, p. 19-20)

Preparedness (2nd of Six NIMS Major Components, 2004): "Effective incident management begins with a host of preparedness activities conducted on a 'steady-state' basis, well in advance of any potential incident. Preparedness involves an integrated combination of planning, training, exercises, personnel qualification and certification standards, equipment acquisition and certification standards, and publication processes and activities." (**DHS**, *NIMS*, March 2004, p. 4)

Preparedness: "The range of deliberate critical tasks and activities necessary to build, sustain, and improve the operational capability to prevent, protect against, respond to, and recover from domestic incidents. Preparedness is a continuous process involving efforts at all levels of government and between government and private sector and nongovernmental organizations to identify threats, determine vulnerabilities, and identify required activities and resources to mitigate risk." (**DHS,** *National Infrastructure Protection Plan*, **2006**, p. 104)

Preparedness (NIMS): "Under NIMS, Preparedness encompasses the full range of deliberate, critical tasks and activities necessary to build, sustain and improve the operational capability to prevent, protect against, respond to and recover from domestic incidents. Preparedness, in the context of an actual or potential incident, involves actions to enhance readiness and minimize impacts. This includes hazard mitigation measures to save lives and protect property from the impacts of terrorism, natural disasters and other events. Additional examples of preparedness activities include:

1. Pre-deployment of response resources;
2. Pre-establishment of incident command posts, mobilization centers, staging areas and other facilities;
3. Evacuation and protective sheltering;
4. Implementation structural and non-structural mitigation measures;
5. Use of remote sensing technology, risk assessment, predictive and plume modeling tools;
6. Private sector implementation of business and continuity of operations plans."

(**DHS**, *National Response Plan* (Draft #1), February 25, **2004**, pp. 15-16; **DHS**, *National Incident Management System*, March 1, 2004, p. 146)

Preparedness: "Preparedness is discussed in the National Response Plan thusly: "the NRP focuses on those activities that are directly related to an evolving incident or potential incident rather than steady-state preparedness or readiness activities conducted in the absence of a specific threat or hazard." (**DHS**, *National Response Framework Draft*, September **2007**, 26)

Preparedness (Incidence Management): "…preparedness or readiness activities conducted in the absence of a specific threat or hazard." (**DHS**, *NRF Comment Draft*, September **2007**, p. 68)

Preparedness (Steady-State): "*A national focus on steady-state readiness is imperative***.** The *Framework* [NRF] focuses on preparedness activities that are *directly related to an evolving incident or potential incident.* The *National Preparedness Guidelines* and the *NIPP* focus on *steady-state preparedness or readiness activities* conducted in the absence of a specific threat or hazard. This response *Framework* does not try to subsume all of these larger efforts; instead, it

integrates these efforts and brings them to bear in managing incidents." (**DHS**, *NRF Comment Draft*, September **2007**, p. 68)

Preparedness: "Effective preparedness requires jurisdictions to identify and have strategies to obtain and deploy major equipment, supplies, facilities, and systems in sufficient quantities to perform assigned missions and tasks. The mobilization, tracking, use, sustaining, and demobilization of physical and human resources require an effective logistics system. That system must support both the residents in need and the teams that are responding to the incident. Resource typing provides a uniform method of sharing commonly understood resources when needed in a major incident." (**DHS**, *National Response Framework*, Jan 2008, 30)

Preparedness: "Evaluation and continual process improvement are cornerstones of effective preparedness." (DHS, *National Response Framework*, Jan 2008, 32)

Preparedness: "Preparedness is not simply about getting ready for disasters. Preparedness is about uniting all of our tools of national power to manage risk. And we have already seen marked improvements of how we, as a nation, protect and prevent under a broad umbrella of risk. We are targeting our Federal operational readiness, risk management, information flow, and grant programs with State and local and private sector partners in a manner that fosters coordination and cooperation. We now have shared doctrine, resources, and increased visibility into shared missions." (**DHS**, *Statement of George Foresman*, 2006, 2)

Preparedness: "Build, sustain and improve the operational capability to prevent, protect against, respond to, and recover from domestic incidents. Preparedness includes:
• Planning, training, and exercises.
• Personnel qualification and certification standards.
• Equipment acquisition and certification standards.
• Publication management processes and activities." (**DHS**, *UTL 2.1*, 2005, p. 8)

Preparedness: Those activities, programs, and systems that exist prior to an emergency that are used to support and enhance response to an emergency or disaster. (**FEMA**, **1992**)

Preparedness: "Preparedness involves establishing authorities and responsibilities for emergency actions and garnering the resources to support them: a jurisdiction must assign or recruit staff for emergency management duties and designate or procure facilities, equipment, and other resources for carrying out assigned duties. This investment in emergency management requires upkeep: the staff must receive training and the facilities and equipment must be maintained in working order. To ensure that the jurisdiction's investment in emergency management personnel and resources can be relied upon when needed, there must be a program of tests, drills, and exercises. Consideration also must be given to reducing or eliminating the vulnerability of the jurisdiction's emergency response organizations and resources to the hazards that threaten the jurisdiction. Accordingly, preparedness measures should not be improvised or handled on an *ad hoc* basis. A key element of preparedness is the development of plans that link the many aspects of a jurisdiction's commitment to emergency management." (**FEMA**, *Guide For All-Hazard Emergency Operations Planning* (SLG 101), **1996**, pp. 1-3 and 1- 4)

Preparedness: "Building the emergency management profession to prepare for, mitigate, respond to, and recover from natural and man-made hazards and terrorist acts through planning, training, education, and exercising." (**FEMA**, *A Nation Prepared – FEMA Strategic Plan*, **2002**, p. 59)

Preparedness (NIMS 2005-2006): 2nd of five Compliance Assessment Metrics. "Describes the specific measures and capabilities that jurisdictions and agencies should develop and incorporate into an overall system to enhance operational preparedness for incident management." (**FEMA**, *NIMSCAST Technical Users Guide Version 1.1*. April 30, 2007, p. 28)

Preparedness (NIMS 2007): "A continuous cycle of planning, organizing, training, equipping, exercising, evaluating, and taking corrective action in an effort to ensure effective coordination during incident response. Within NIMS preparedness focuses on the following elements: planning, procedures and protocols, training and exercises, personnel qualification and certification, and equipment certification." (**FEMA**, *NIMS* (FEMA 501/Draft), **2007**, p. 156)

Preparedness: "The range of deliberate, critical tasks and activities necessary to build, sustain, and improve the capability to protect against, respond to, and recover from hazard impacts. Preparedness is a continuous process. Within NIMS, preparedness involves efforts at all levels of government and the private sector to identify threats, to determine vulnerabilities, and to identify required response plans and resources. NIMS preparedness focuses on establishing guidelines, protocols, and standards for planning, training and exercise, personnel qualifications and certification, equipment certification, and publication management." (**HHS**, *Medical Surge Capacity and Capability Handbook*, August 2004, p. D-9, Glossary)

Preparedness: "The ability to plan, organize, equip, train, and exercise homeland security personnel to perform their assigned missions to nationally accepted standards—this mission area includes public education and awareness." (**Homeland Security Council**, *National Planning Scenarios* Final Draft, March 2006, p. vi)

Preparedness: "Build, sustain, and improve the operational capability to prevent, protect against, respond to, and recover from domestic incidents. Preparedness includes:

- Planning, training, and exercises
- Personnel qualification and certification standards
- Equipment acquisition and certification standards
- Publication management processes and activities
- Mutual aid agreements and Emergency Management Assistance Compacts (EMACS)." (**Homeland Security Institute**, *HS Strategic Planning MAA* (for DHS), Appendix B: MAA Common Task Definitions, p. 61) [Note: See DHS, NIMS, 2004, pp. 4-5, not cited, and DHS, UTL, 2005, 8.]

Preparedness: Establishing and delineating authorities and responsibilities for emergency actions and making provisions for having the people, equipment, and facilities in place to respond when the need arises. Preparedness involves planning, training, exercising, procuring and maintaining equipment, and designating facilities for shelters and other emergency purposes. (**MI DEM** 1998, 7)

Preparedness: "Preparedness is the range of deliberate, critical tasks and activities necessary to build, sustain, and improve the operational capability to prevent, protect against, respond to, and recover from domestic incidents. Preparedness is a continuous process involving efforts at all levels of government as well as between government and private-sector and nongovernmental organizations to identify threats, determine vulnerabilities, and identify required resources." (**NCR**, *National Capital Region Homeland Security Strategic Plan 2007-2009 – Overview*, August 2006, p. 4)

Preparedness: "Activities, tasks, programs, and systems developed and implemented prior to an emergency that are used to support the prevention of, mitigation of, response to, and recovery from emergencies." (**NFPA,** *NFPA 1600*, 2007, p. 8)

Preparedness: "Preparedness activities are necessary to the extent that mitigation measures have not, or cannot, prevent disasters. In the preparedness phase, governments, organizations, and individuals develop plans to save lives and minimize disaster damage (for example, compiling state resource inventories, mounting training exercises, or installing warning systems). Preparedness measures also seek to enhance disaster response operations (for example, by stockpiling vital food and medical supplies, through training exercises, and by mobilizing emergency personnel on a standby basis)." (**NGA**, *CEM Governors' Guide*, 1979, p. 13)

Preparedness: "Preparedness represents actions that are undertaken to reduce the negative consequences of events where there is insufficient human control to institute mitigation measures." (**Peterson and Perry** 1999, 242)

Preparedness: "…planning, training, and building the emergency management profession to prepare effectively for, mitigate against, respond to, and recover from any hazard." (**Post-Katrina Emergency Management Reform Act of 2006**, p. 1399)

Preparedness: "Part of the problem is the lack of a common definition of "preparedness." When PricewaterhouseCoopers' Health Research Institute (HRI) asked industry leaders to define preparedness, they agreed on only two things: (1) there is currently no universally accepted definition of preparedness; and (2) we must continue getting "better prepared." Without a definition, it's hard to develop benchmarks. Noted Irwin Redlener, M.D., associate dean and director of the National Center for Disaster Preparedness at the Columbia University Mailman School of Public Health, 'Whatever you think about being prepared as an individual or family, extrapolate that to a hospital CEO. They have no idea of what the end point is because there are no satisfactory benchmarks to establish what we mean by '*prepared.*'" (**PricewaterhouseCoopers**, 2007, p. 5)

Preparedness: involves the development and regular testing of warning systems (linked to forecasting systems) and plans for evacuation or other measures to be taken during a disaster alert period to minimize potential loss of life and physical damage; the education and training of officials and the population at risk; the establishment of policies, standards, organizational arrangements and operational plans to be applied following a disaster impact; the securing of resources (possibly including the stockpiling of supplies and the earmarking of funds); and the training of intervention teams. It must be supported by enabling legislation. (**Simeon Institute** 1998)

Preparedness: "Activities designed to minimize loss of life and damage, to organize the temporary removal of people and property from a threatened location and facilitate timely and effective rescue, relief and rehabilitation. See also 'prevention'." (**UNDHA**, *Internationally Agreed Gloss.*. 1992, 59)

Preparedness: "Activities and measures taken in advance to ensure effective response to the impact of disasters, including the issuance of timely and effective early warnings and the temporary removal of people and property from a threatened location." (**UN/ISDR** 2002, 25)

Preparedness: "(c) Preparedness. The Office of Homeland Security shall coordinate national efforts to prepare for and mitigate the consequences of terrorist threats or attacks within the United States. In performing this function, the Office shall work with Federal, State, and local agencies, and private entities, as appropriate, to:

(i) review and assess the adequacy of the portions of all Federal emergency response plans that pertain to terrorist threats or attacks within the United States;

(ii) coordinate domestic exercises and simulations designed to assess and practice systems that would be called upon to respond to a terrorist threat or attack within the United States and coordinate programs and activities for training Federal, State, and local employees who would be called upon to respond to such a threat or attack;

(iii) coordinate national efforts to ensure public health preparedness for a terrorist attack, including reviewing vaccination policies and reviewing the adequacy of and, if necessary, increasing vaccine and pharmaceutical stockpiles and hospital capacity;

(iv) coordinate Federal assistance to State and local authorities and nongovernmental organizations to prepare for and respond to terrorist threats or attacks within the United States;

(v) ensure that national preparedness programs and activities for terrorist threats or attacks are developed and are regularly evaluated under appropriate standards and that resources are allocated to improving and sustaining preparedness based on such evaluations; and

(vi) ensure the readiness and coordinated deployment of Federal response teams to respond to terrorist threats or attacks, working with the Assistant to the President for National Security Affairs, when appropriate." (**White House**, *EO 13228*, October 8, 2001)

Preparedness: "The term 'preparedness' refers to the existence of plans, procedures, policies, training, and equipment necessary at the Federal, State, and local level to maximize the ability to prevent, respond to, and recover from major events. The term 'readiness' is used interchangeably with preparedness." (**White House**, *HSPD-8*, December 2003)

Preparedness Capability (Elements):

- *Planning*: Collection and analysis of intelligence and information, and development of policies, plans, procedures, mutual aid agreements, strategies, and other publications that comply with relevant laws, regulations, and guidance necessary to perform assigned missions and tasks.
- *Organization and Leadership*: Individual teams, an overall organizational structure, and leadership at each level in the structure that comply with relevant laws, regulations, and guidance necessary to perform assigned missions and tasks.

- *Personnel:* Paid and volunteer staff who meet relevant qualification and certification standards necessary to perform assigned missions and tasks.
- *Equipment and Systems*: Major items of equipment, supplies, facilities, and systems that comply with relevant standards necessary to perform assigned missions and tasks.
- *Training*: Content and methods of delivery that comply with relevant training standards necessary to perform assigned missions and tasks.
- *Exercises, Evaluations, and Corrective Actions:* Exercises, self-assessments, peer-assessments, outside reviews, compliance monitoring, and actual major events that provide opportunities to demonstrate, evaluate, and improve the combined capability and interoperability of the other elements to perform assigned missions and tasks to standards necessary to achieve successful outcomes." (**DHS**, *National Preparedness Guidelines*, September 13, 2007, p. 5)

Preparedness Cycle: (Also described as "six essential activities for responding to an incident")
- Plan
- Organize
- Train
- Equip
- Exercise
- Evaluate and Improve (**DHS**, *NRF*, Jan 2008, 27)

Preparedness Cycle:
- Conduct Risk Assessment
- Conduct Capabilities Assessment
- Develop Strategy
- Plan and Resource Programs
- Identify/Purchase Equipment
- Develop Multi-year Training and Exercise Plan and Schedule
- Conduct Training
- Conduct Exercises to Validate Training and Plans
- Assign Corrective Actions resulting from Exercise Evaluation and Improvement Plans
- Track/Implement Corrective Actions
- Update Capabilities Assessment/Strategy/Multi-year Plans (**DHS**, *TCL*, 2007, p. 13)

Preparedness Cycle: "The Preparedness Cycle, which provides a process for developing, evaluating, and improving homeland security preparedness, serves as the organizing construct for NPD analyses.
- Plan
- Organize, Equip & Train
- Exercise
- Evaluate and Improve" (**FEMA**, *90 Day Update to Congress on National Preparedness*, Dennis R. Schrader, Deputy Administrator National Preparedness, Apr 2008, slide 11)

Preparedness Fatigue: A reporters question during White House Press Conference on Pandemic Preparedness: "I was just wondering in the different areas that you work in whether or

not you're seeing any preparedness fatigue, given that we're two years into it and will probably go -- continue for a few more years before anything probably happens. But just wondering if you've seen any preparedness fatigue, and if you haven't, what are your thoughts about how you should deal with it, once it starts surfacing in years to come?" Answer from Dr. Jeff Runge, DHS Chief Medical Officer: "I appreciate you pointing this out… you know, we need to reach a battle rhythm of a state of preparedness that is higher than it was before the President made this a priority, and the absence of any hyperventilation but more as a marathon." (**White House**, *Press Briefing on National Strategy for Pandemic Influenza Implementation Plan: One Year Summary*, July 17, 2007)

Preparedness Goal: "The best way to protect against the effects of harmful incidents is to be prepared. Preparedness and mitigation are important elements in reducing the impacts of acts of terror and other disasters. We will ensure all levels of public safety and emergency management are capable of rapid and effective response by establishing a unified, capabilities-based preparedness strategy incorporating all-hazards assessments, training, exercises and assistance for federal, state, tribal and local governments, first responders and communities. We will establish, implement and evaluate capabilities through a system of national standards, mutual aid systems and credentialing protocols, and supply technologies for rapid and interoperable communications, personal protection and incident management. We will implement and sustain a national citizen preparedness movement that includes private sector involvement. We will expand the Nation's community risk management capabilities and reduce the Nation's vulnerability to acts of terrorism and other disasters through effective vulnerability assessments and risk management programs." (**DHS**, *Securing the Homeland Strategic Plan*, **2004**, p. 26)

Preparedness Organizations: "Preparedness is the responsibility of individual jurisdictions; this responsibility includes coordinating various preparedness activities among all appropriate agencies within a jurisdiction, as well as across jurisdictions and with private organizations. This coordination is effected by mechanisms that range from individuals to small committees to large standing organizations. These mechanisms are referred to in this document as 'preparedness organizations,' in that they serve as ongoing forums for coordinating preparedness activities in advance of an incident. Preparedness organizations represent a wide variety of committees, planning groups, and other organizations that meet regularly and coordinate with one another to ensure an appropriate focus on planning, training, equipping, and other preparedness requirements within a jurisdiction and/or across jurisdictions. The needs of the jurisdictions involved will dictate how frequently such organizations must conduct their business, as well as how they are structured. When preparedness activities routinely need to be accomplished across jurisdictions, preparedness organizations should be multijurisdictional. Preparedness organizations at all jurisdictional levels should

- Establish and coordinate emergency plans and protocols including public communications and awareness;
- Integrate and coordinate the activities of the jurisdictions and functions within their purview;
- Establish the standards, guidelines, and protocols necessary to promote interoperability among member jurisdictions and agencies;

- Adopt standards, guideline, and protocols for providing resources to requesting organizations, including protocols for incident support organizations;
- Set priorities for resources and other requirements; and
- Ensure the establishment and maintenance of multiagency coordination mechanisms, including EOCs, mutual-aid agreements, incident information systems, nongovernmental organization and private-sector outreach, public awareness and information systems, and mechanisms to deal with information and operations security." (**DHS**, *NIMS*, 2005, pp. 34-35)

Preparedness Planning: "Plans must be realistic, scalable, and applicable to all types of incidents, from daily occurrences to incidents requiring the activation of interstate mutual aid, and to those requiring a coordinated Federal response. Plans, including emergency operations plans, should form the basis of training and be exercised periodically to ensure that all individuals involved in response are able to execute their assigned tasks. It is essential that plans address training and exercising and allow for the incorporation of after-action reviews, lessons learned and corrective actions with responsibility agreements following any major incidents or exercises. Plans should be updated periodically to reflect changes in the emergency management and incident response environment, as well as any institutional or organizational changes.

Plans describe how personnel, equipment, and other governmental and nongovernmental resources will be used to support emergency management and incident response requirements. They represent the operational core of preparedness and provide mechanisms for setting priorities, integrating multiple jurisdictions/organizations and functions, establishing collaborative relationships, and ensuring that communications and other systems effectively support the full spectrum of emergency management and incident response activities. Plans should also incorporate strategies for maintaining continuity of government and continuity of operations during and after incidents, provide mechanisms to ensure resiliency of critical infrastructure and economic stability of communities, and incorporate the advance planning associated with resource management, and communications and information management.

Plans should integrate all relevant departments, agencies, and organizations (including the private sector and NGOs, where appropriate) to facilitate coordinated emergency management and incident response activities. Where appropriate, these plans should incorporate a clearly defined process for seeking and requesting assistance from necessary department(s), agency(ies), and/or organizations. The Federal Government has defined plans by which Federal response resources will be deployed prior to or during incidents. Jurisdictions should be aware of these plans in order to accommodate Federal resources when necessary and should integrate them into their plans as appropriate. While it is recognized that jurisdictions and/or organizations will develop multiple types of plans, such as response, mitigation, and recovery plans, it is essential that these plans be coordinated and complement one another." (**FEMA**, *National Incident Management System* (FEMA 501/Draft), August 2007, p. 16)

Preparedness Planning (Procedures and Protocols): "Procedures and protocols should detail the specific actions that can be taken to implement a plan or system. All emergency management/response personnel and their affiliated organizations should develop procedures and

protocols that translate into specific action-oriented checklists for use during incident response operations, including how the organizations will accomplish their assigned tasks.

Procedures are documented and implemented with: checklists; resource listings; maps, charts, and other pertinent data; mechanisms for notifying staff; processes for obtaining and using equipment, supplies, and vehicles; methods of obtaining mutual aid agreements and/or assistance agreements; mechanisms for reporting information to Department Operations Centers (DOC) and EOCs; and communications operating instructions, including connectivity among governments, the private sector, and NGOs. There are four standard levels of procedural documents:

Standard Operating Procedure (SOP) or Operations Manual: Complete reference document that provides the purpose, authorities, duration, and details for the preferred method of performing a single function or a number of interrelated functions in a uniform manner.

Field Operations Guide or Incident Management Handbook: Durable pocket or desk guide that contains essential information required to perform specific assignments or functions.

Mobilization Guide: Reference document used by agencies/organizations outlining agreements, processes, and procedures used by all participating organizations for activating, assembling, and transporting resources.

Job Aid: Checklist or other visual aid intended to ensure that specific steps of completing a task or assignment are accomplished. Job aids may also serve as training aids to teach how to complete specific job tasks.

Protocols are sets of established guidelines for actions (which may be designated by individuals, teams, functions, or capabilities) under various specified conditions. Establishing protocols provides for the standing orders, authorizations, and delegations necessary to permit the rapid execution of a task, function, or a number of interrelated functions without seeking permission to do so. Based on training and delegation of authority, protocols permit specific personnel to assess the situation presented, take immediate steps to intervene, and escalate their efforts to a specific level before further guidance or authorizations are required." (**FEMA**, *National Incident Management System* (FEMA 501/Draft), August 2007, p. 19)

Preparedness Plans (Operational): "Operational plans identify and direct the agencies/organizations and resources required to execute the tasks and objectives necessary based on the strategic planning. Operational plans often include (but are not limited to) contingency and tactical plans." (**FEMA**, *NIMS* (FEMA 501/Draft), August 2007, p. 17)

Preparedness Plans (Strategic): "Strategic plans define and develop programmatic priorities that address requirements, goals, objectives, milestones, and resources that ensure interoperable and integrated actions among all levels of government, the private sector, and NGOs to manage all-hazard emergency management and incident response activities. Strategic planning involves the adoption of long-range goals and objectives, the setting of priorities, the establishment of budgets and other fiscal decisions, policy development, and the application of measures of performance or effectiveness." (**FEMA**, *NIMS* (FEMA 501/Draft), August 2007, p. 17)

Preparedness Priorities: "PREPAREDNESS PRIORITIES.—In establishing the guidelines under subsection (a), the Administrator shall establish preparedness priorities that appropriately balance the risk of all hazards, including natural disasters, acts of terrorism, and other man-made disasters, with the resources required to prevent, respond to, recover from, and mitigate against the hazards." (**Post-Katrina Emergency Management Reform Act of 2006**, p. 1426)

Preparedness Strategy: "The FEMA preparedness strategy is to build and maintain a collaborative framework of Federal, state, local and private sector resources that can ensure effective response to all hazards. The centerpiece of this preparedness strategy is the establishment of emergency management performance objectives to guide continuous capability enhancement at all levels of government.

"FEMA, in partnership with the states, will foster innovation and improvement by facilitating emergency management professional development training; assisting in the establishment of performance standards and assessment through tests, exercises and real world experiences; supporting planning and public education; and by forming partnerships with the private sector and other nations to support a robust emergency management capability. The strategy will foster a decentralized capability for state and local preparedness and response for all but the most catastrophic disasters." (**FEMA** *Strategic Plan FY 1998-2002*, 1997, p. 25)

Preparedness Tasks (DHS Target Capabilities List): "Preparedness activities and tasks are those things that should be done prior to the demand for the capability. Development of plans, procedures, protocols, and systems; establishment of mutual aid agreements and authorities; provision of training; and the conduct of exercises are all examples of preparedness tasks." (**DHS**, *TCL*, 2007, p. 6)

PREPnet: "The Preparedness Network (PREPnet) is a satellite-based distance learning system used by…[FEMA/National Emergency Training Center] to bring interactive training programs into virtually any community nationwide." (**FEMA,** *About the National Preparedness Network*)

Pre-Positioned Disaster Supplies (PPDS) Program: "The Pre-Positioned Disaster Supplies (PPDS) Program was developed to position life saving and life sustaining disaster equipment and supplies as close to a potential disaster site as possible. The goal is to substantially shorten the response time from incident to delivery of these initial critical assets… The strategy is to place PPDS containers in hurricane/typhoon-prone states first, then earthquake-prone, then highly populous metropolitan areas…. PPDS containers are also stockpiled at various locations where containers are staged and ready for transport as threats arise." (**FEMA**. "Homeland Security's Pre-Positioned Disaster Supplies (PPDS) Program," May 16, 2006)

Pre-positioned Equipment Program (PEP): "The PEP consists of caches of standardized equipment pods, deployable to support State and local governments facing a major chemical, biological, radiological, nuclear, or explosives (CBRNE) event. PEP pods are supported by specialized teams of emergency responders and contain personal protective, decontamination, detection, technical search and rescue, law enforcement, interoperable communications and other emergency response equipment. The pods are available to State and local governments through formal requests and deployment procedures that are initiated by the Governors. In addition to

State and local government support, PEP is used on the Federal level to supplement response operations including the National Disaster Medical System and Urban Search & Rescue." (**FEMA**, *Statement of Glenn Cannon*, November 15, 2007, p. 9)

Pre-positioned Equipment Program (PEP): "Each PEP unit consists of a $2.2 million cache of standardized equipment pods and a Special Events Pod (SEP). The pods are deployable to state and local governments facing a major chemical, biological, radiological, nuclear, explosives or natural hazard event of national emergency within 10 to 12 hours." (**FEMA**, *NEMA Initiatives and Issues From the Disaster Operations Directorate*, August 20, 2007, p. 11)

Pre-Scripted Mission Assignment(s) (PSMAs): "In order to expedite the delivery of Federal assistance, FEMA is developing "Pre-Scripted" Mission Assignments (PSMAs) that provide standard "Statements of Work" to other departments and agencies prior to an actual disaster or emergency. The use of PSMAs is expected to streamline the process and to provide a planning base for the Federal agencies. However, not all mission assignments are intended to be pre-scripted and those that are may be modified to meet event-specific needs. FEMA may use PSMAs as templates for statements of work to expedite planning and execution. FEMA and the Federal departments and agencies will develop PSMAs jointly. All PSMAs will include cost estimates. PSMAs will not automatically be issued unless requested and necessary. The Statements of Work (SOWs) for "Pre-Scripted" missions may be adjusted to meet event specific needs." (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 25, 2007, p. 1; also 58)

Presidential Decision 41, 1978, on Civil Defense Policy: PD 41 was the result of an "interagency study of U.S. civil defense policy, directed by the President in September 1977…conducted over a period of about a year…[drawing upon] studies of Soviet and U.S. civil defense programs… Among the specific questions addressed were: 'What is the role of civil defense in strategic policy?' 'Can civil defense make a significant difference in the outcome of a nuclear exchange?' 'What civil defense measures would be most useful?' and finally, 'If a role is identified, what should it be?' Hence, the study looked not only at whether civil defense would make a difference in nuclear war, but also at whether it could play a role in a preattack crisis.

"The study examined a range of CD program options for the United States, and was presented to the Policy Review Committee of the NSC and then to the President. The options were essentially the same as those analyzed in…[an] earlier study for the Secretary of Defense: 91) essentially no program; (2) the current program; (3) a program providing for evacuating the population of larger U.S. cities and other risk areas, should time permit during a period of strategic warning resulting from an international crisis; and (4) a short warning time program to protect the population in-place, including construction of blast shelters in cities.

"In September 1978, the President directed in Presidential Decision (PD) 41 that a new civil defense policy be implemented along the following lines:

- That the United States civil defense program should enhance the survivability of the American people and its leadership in the event of nuclear war, thereby improving the basis for eventual recovery, as well as reducing vulnerability to a major Soviet attack;

- That the program should enhance deterrence and stability, and contribute to perceptions of the overall U.S./Soviet strategic balance and to crisis stability, and also reduce the possibility that the Soviets could coerce us in times of increased tension;
- That the CD policy not suggest any change in the U.S. policy of relying on strategic nuclear forces as the preponderant factor in maintaining deterrence; and,
- That the program include planning for population relocation during times of international crisis as well as be adaptable to help deal with natural disasters and other peacetime emergencies." (**Chipman**, *CD For the 1980's*, 1979, pp. 24-25)

Presidential Decision Directive (PDD) 39, US Policy on Counterterrorism 1995:
"Presidential Decision Directive 39 (PDD 39), signed in June 1995, is the foundation for current [2001] U.S. policy for combating terrorism. The document spells out three objectives for confronting terrorism: 1) reduce the nation's international and domestic vulnerabilities to terrorism; 2) deter terrorism; and 3) respond to terrorism rapidly and decisively. PDD 39 designates Lead Federal Agencies for international and domestic terrorism policy. The Lead Federal Agency for combating terrorism overseas is the Department of State (DOS) and the agency designated to respond to terrorist attacks on U.S. soil is the Department of Justice (DOJ) through the Federal Bureau of Investigation (FBI). The Federal Emergency Management Agency (FEMA) has primary responsibility to lead federal efforts to deal with the consequences and collateral second and third order effects of terrorist WMD attacks on American soil. PDD 39 pays particular attention to WMD and includes language stating "The United States shall give the highest priority to developing effective capabilities to detect, prevent, defeat and manage the consequences of nuclear, biological or chemical (NBC) materials or weapons use by terrorists'."[102] (**CRS**, *Terrorism and the Military's Role in Domestic Crisis Management…,* 19April2001, p. 5)

Presidential Decision Directive (PDD) 39, US Policy on Counterterrorism 1995:
"Presidential Decision Directive 39, U.S. Policy on Counterterrorism, June 21, 1995, establishes policy to reduce the Nation's vulnerability to terrorism, deter and respond to terrorism, and strengthen capabilities to detect, prevent, defeat and manage the consequences of terrorist use of WMD and assigns agency responsibilities. Portions of the PDD, to include the distinction between crisis and consequence management, have been superceded by the President's direction in HSPD-5." (**DHS**, *National Response Plan* (Draft #1), February 25, 2004, p. 72; also **W. H.**, *PDD-39*, June 21, 1999)

Presidential Decision Directive (PDD) 39, US Policy on Counterterrorism, 1995: "PDD-39…designates DOJ, specifically the FBI, as the LFA [Lead Federal Agency] for CrM [Crisis Management]. (**JCS/DoD**, *Homeland Security* (JP 3-26), 2005, p. IV-8)

Presidential Decision Directive (PDD) 39, US Policy on Counterterrorism, 1995: "PDD-39 validates and reaffirms existing federal lead agency responsibilities for counterterrorism, which are assigned to DOJ, as delegated to the FBI, for threats or acts of terrorism within the United States. The FBI as the LFA for CrM will involve only those federal agencies required and

[102] Presidential Decision Directive 39, *U.S. Policy on Counterterrorism*, The White House, June 21, 1995.

designated. The Directive further states that DHS/FEMA with the support of all agencies in the NRP, will support the FBI until the Attorney General transfers lead agency to DHS/FEMA. DHS/FEMA retains responsibility for CM throughout the response." (**JCS/DoD**, *Homeland Security* (JP 3-26), 2005, p. A-3)

Presidential Decision Directive (PDD) 62, 1998: "Presidential Decision Directive 62, Combating Terrorism, May 22, 1998, reinforces the missions of Federal departments and agencies charged with roles in defeating terrorism. Portions of the PDD have been superceded." (**DHS**, *National Response Plan* (Draft #1), February 25, 2004, p. 72)

Presidential Decision Directive (PDD) 62, 1998: *Protection Against Unconventional Threats to the Homeland and Americans Overseas*, May 22, 1998. "PDD-62, issued by President Clinton on May 22, 1998, directs the establishment of an integrated program to increase U.S. effectiveness in countering terrorist threats and to prepare to manage the consequences of attacks against U.S. citizens or infrastructures. Lead agencies responsible for supporting the program… must designate a Senior Program Coordinator who is responsible for coordinating this effort within the U.S. government. This PDD reaffirms and complements the directives contained in PDD 39…. PDD 62 also requires each agency to maintain a Continuity of Operations Plan as outlined in Executive Order 12656. This plan must ensure the operation of essential agency functions following an attack that incapacitates headquarters facilities and key leadership." (**EPA,** *Presidential Decision Directives*, 2007)

Presidential Decision Directive (PDD) 63 (1998) **-- Critical Infrastructure Protection** (superseded by HSPD-7, Critical Infrastructure Identification, Prioritization, and Protection): "The goal of PDD 63, issued by President Clinton in 1998, is that public and private organizations be able to maintain continuity of the U.S. critical infrastructure in the event of a terrorist attack. Critical infrastructure includes the physical and cyber-based systems that are essential for the economy and the government to operate at a minimum level. Because these systems are highly automated and interconnected, they are vulnerable to physical and cyber attack. Examples of critical infrastructure systems are telecommunications, banking, energy, transportation, water systems, and emergency services.

Minimum operation of the economy and government includes the following:

- The federal government performs essential national security missions and ensures public health and safety.
- State and local governments maintain order and deliver minimum essential public services.
- The private sector ensures the orderly functioning of the economy and delivery of essential services.

The Role of Federal Agencies -- Each agency has specific responsibilities for maintaining continuity of government operations:

- protect its own critical infrastructure, "including but not limited to its cyber-based systems"

- make the Chief Information Officer responsible for keeping agency information accessible
- appoint a Critical Infrastructure Assurance Officer to protect all other critical infrastructure
- develop and implement a Critical Infrastructures Protection Plan (CIPP) by May of 2000.

Agencies also participate in the Critical Infrastructures Coordination Group created under this directive." (**EPA**, *Presidential Decision Directives*)

Presidential Decision Directive (PDD/NSC) 67: *Enduring Constitutional Government and Continuity of Government Operations,* October 21, 1998: "PDD 67 succeeded NSD 69 "Enduring Constitutional Government" of June 1992. PDD 67, among other things, requires federal agencies to develop COOP plans for essential operations. These COOP plans were viewed as a unifying concept not to replace existing plans but, instead, to be superimposed if and when a problem threatens a serious disruption of agency operations.

"Several Federal Preparedness Circulars (FPCs) that detail a series of government policies specific to COOP planning and national security emergency preparedness have been written under the authority of PDD 67. The focus of these documents includes succession, vital records, training, COOP requirements, alternative facility requirements, and communications. They are associated with supporting all Federal organizations with viable COOP programs.

"FPC 65 provides guidance to all Federal Executive Branch departments, agencies, and independent organizations on the development of viable and executable COOP plans.
FPC 66 further supports COOP efforts by providing guidance on the development of test, training, and exercise programs to support the implementation and validation of COOP plans.

"FPC 67, designed as a supplement to FPC 65, provides guidance on implementing COOP plans, specifically in locating alternate facilities to support COOP efforts." (**White House**, PDD 67)

Presidential Decision Directive (PDD/NSC) 67: "PDD 67, issued in 1998, addressed enduring constitutional government and introduced continuity of operations plan (COOP) and continuity of government operations. PDD 67 succeeded NSD 69 "Enduring Constitutional Government" of June 1992. PDD 67, among other things, requires federal agencies to develop COOP plans for essential operations. These COOP plans were viewed as a unifying concept not to replace existing plans but, instead, to be superimposed if and when a problem threatens a serious disruption of agency operations. Several Federal Preparedness Circulars (FPCs) that detail a series of government policies specific to COOP planning and national security emergency preparedness have been written under the authority of PDD 67. The focus of these documents includes succession, vital records, training, COOP requirements, alternative facility requirements, and communications. They are associated with supporting all Federal organizations with viable COOP programs. FPC 65 provides guidance to all Federal Executive Branch departments, agencies, and independent organizations on the development of viable and executable COOP plans. FPC 66 further supports COOP efforts by providing guidance on the development of test, training, and exercise programs to support the implementation and validation of COOP plans. FPC 67, designed as a supplement to FPC 65, provides guidance on

implementing COOP plans, specifically in locating alternate facilities to support COOP efforts." (**White House**, *Presidential Decision Directive 67 (PDD 67): Enduring Constitutional Government and Continuity of Government*. October 1998)

Presidential Major Disaster Declaration: "A **Presidential major disaster declaration** triggers long-term Federal recovery programs, some of which are matched by State programs, and designed to help disaster victims, businesses, and public entities." (**DHS**, *NRF*, 2008, 41)

President's Commission on Critical Infrastructure Protection (PCCIP): "The PCCIP was established July 15, 1996, and charged with developing a national policy and the implementation strategies for protecting our critical infrastructures from both physical and cyber threats. The goal, of course, was to assure the infrastructures' continued operation. The President identified eight infrastructures (Figure 1)—or our nation's life support systems, as I view them—for study. The incapacity or destruction of these systems would have a debilitating effect on the defense and/or economic security of the United States.

Telecommunications
Banking & Finance
Electric Power
Water
Transportation
Emergency Services
Oil & Gas Delivery & Storage
Government Services….

The Commission was uniquely tailored for its task. Recognizing that the infrastructures are largely owned and operated by the private sector, the Commission was established as a joint, public-and-private undertaking. Therefore, half the commissioners came from the private sector and the other half were detailed from the affected agencies of government. A Steering Committee made up of senior government officials oversaw the work of the commissioners and guided us through myriad government concerns. A Presidentially appointed Advisory Committee made up of key industry leaders provided the unique perspective of infrastructure owners and operators. Finally, there was an Infrastructure Protection Task Force, established at the same time as the Commission, and intended to support infrastructure protection and coordinate the activities of government should a problem develop prior to the completion of the Commission's efforts and implementation of its recommendations." (**Marsh**, *Critical Foundations,* 12Nov97)

Pressure and Release (PAR) Model: "The PAR model (described in an analytical framework (Blaikie et al., 1994, Wisner et al., 2003)identifies a disaster as the outcome of, on one side, natural hazards, such as the Indian Ocean tsunami, and on the other, a progression of driving forces which shapes the degree of *people's vulnerability* to these hazards. These driving forces, which are primarily socio-economic and political, determine the extent to which people can protect themselves and recover from the occurrence of a "natural" disaster. These slower acting, often insidious and tacitly acknowledged, aspects of political and economic life which shape people's vulnerability are brutally exposed upon the sudden onset of a natural event, such as a tsunami, but can also include earthquakes, volcanic eruptions, wild fires, riverine and coastal

floods, and storms. So people's vulnerability and ecosystem vulnerability are shaped by long term and slow acting processes…. until a sudden event occurs, the impact of which is partly determined by long term processes which produce vulnerability of people and ecosystems." (**Blaikie**, *The Indian Ocean Tsunami*, 2005)

Pressure and Release (PAR) Model: "The starting point of the pressure and release model is that a disaster is the intersection of two opposing forces: the process generating vulnerability on one side, and the physical exposure to hazard on the other. Increasing pressure can come from either side but vulnerability has to be reduced to relieve the pressure. Vulnerability is considered in three levels: root causes, dynamic pressures and unsafe conditions. The strengths of the model are that it provides a broad view of vulnerability, it gives weight to natural hazards, and it provides a framework for looking at livelihoods and vulnerability. The limitation of the model, is that it is a tool for explaining vulnerability, not for measuring it. The model cannot be applied operationally without a great deal of data collection and analysis." (**UNDAP**, *Techniques*, 2008)

Pressure and Release (PAR) Model: "Whether…hazards turn into a natural disaster has been summarized by the following simple Pressure and Release (PAR) Model: *Disaster Risk = Hazard + Vulnerability.* The likelihood of hazards leading to disasters is thus primarily dependant on an area or people's level of vulnerability. Many issues can increase vulnerability but these tend to depend upon:

- root causes: e.g. limited access to resources or poor political or economic systems
- dynamic pressures: e.g. lack of training, skills, investment, local institutions
- macro-forces: e.g. rapid population growth or urbanization, poor planning, deforestation, decline in soil productivity

Together these issues can result in vulnerable conditions (e.g. fragile physical environments or local economies, or lack of preparedness to disaster) which when combined with a hazard can lead to disaster. The level of vulnerability, and thus the likelihood of a hazard developing into a disaster, is therefore in many cases in our control." (**WWF**, *Natural Security*, 1008, 17; cites Blaikie, *At Risk,* 1994)

Prevent: "The prevention mission includes operations and activities to reduce risk of threats and vulnerabilities, to intervene and stop an occurrence, or to mitigate effect. Homeland security prevention is generally achieved via counter-terrorism operations and is usually led by members of the law enforcement community." (**DHS**, Chapter 2, *Capstone Doctrine Pub 1 Draft*, 2008, 5)

Prevent: "Actions to avoid an incident or to intervene or stop an incident from occurring. Prevention involves actions taken to protect lives and property. It involves applying intelligence and other information to a range of activities that may include such countermeasures as deterrence operations; heightened inspections; improved surveillance and security operations; investigations to determine the full nature and source of the threat; public health and agricultural surveillance and testing processes; immunizations, isolation, or quarantine; and, as appropriate, specific law enforcement operations aimed at deterring, preempting, interdicting, or disrupting illegal activity and apprehending potential perpetrators and bringing them to justice"

(**DHS/ODP**, *State and Urban Area HS Strategy: Guidance*, June 2005, p. 3 (citing DHS, NIMS, March 2004).

Prevent: "Actions to avoid an incident or to intervene to stop an incident from occurring. Prevention involves actions taken to protect lives and property, including: intelligence and deterrence operations; heightened inspections; improved surveillance and security operations; investigations; public health and agricultural surveillance and testing processes; immunizations, isolation, or quarantine; and certain law enforcement operations. Public announcements, evacuation planning, infrastructure improvements and citizen disaster preparation also are important especially when considering an "all hazards" approach." (**DHS**, *Fiscal Year 2006 Homeland Security Grant Program: Application Kit and Program*, October 5, **2005**, pp. 1-2)

Prevent: "Deter all potential terrorists from attacking America, detect terrorists before they strike, prevent them and their instruments of terror from entering our country, and take decisive action to eliminate the threat they pose." (**DHS**, *UTL* 2.1, 2005, p. 20)

Preventative Measures: "Controls aimed at deterring or Mitigating undesirable events form taking place." (**DigitalCare**, *State of Oregon Business Continuity Workshop*, 2006, p. 61)

Prevention: "Definition: actions taken and measures put in place for the continual assessment and readiness of necessary actions to reduce risk of threats and vulnerabilities, to intervene and stop an occurrence, or to mitigate effects. Extended definition: involves prescribed actions and measures put in place to impede the success of a natural or man-made disaster from adversely affecting the safety, security, or continuity of the Nation, critical infrastructures its citizens, and citizen's civil rights or civil liberties." (**DHS**, *Lexicon: Terms and Definitions*, October 19, **2007**, p. 20)

Prevention: "Prevention involves actions to interdict, disrupt, pre-empt or avert a potential incident. This includes homeland security and law enforcement efforts to prevent terrorist attacks. Prevention includes actions to:

1. Collect, analyze, and apply intelligence and other information;
2. Conduct investigations to determine the full nature and source of the threat;
3. Implement countermeasures such as inspections, surveillance, security and infrastructure protection;
4. Conduct tactical operations to interdict, preempt, or disrupt illegal activity; and to apprehend and prosecute the perpetrators;
5. Conduct public health surveillance and testing processes, immunizations, and isolation or quarantine for biological and agricultural threats; and
6. Deter, defeat, detect, deny access or entry, and take decisive action to eliminate threats." (**DHS,** *National Response Plan* (Draft #1), February 25, **2004**)

Prevention. "Actions to avoid an incident or to intervene to stop an incident from occurring. Prevention involves actions taken to protect lives and property. It involves applying intelligence and other information to a range of activities that may include such countermeasures as deterrence operations; heightened inspections; improved surveillance and security operations; investigations to determine the full nature and source of the threat; public health and agricultural

surveillance and testing processes; immunizations, isolation, or quarantine; and, as appropriate, specific law enforcement operations aimed at deterring, preempting, interdicting, or disrupting illegal activity and apprehending potential perpetrators and bringing them to justice. (**DHS**, *NIMS*, 2004, pp. 134-135)

Prevention: "Actions taken to avoid an incident or to intervene to stop an incident from occurring. Prevention involves actions taken to protect lives and property. Involves applying intelligence and other information to a range of activities that may include such countermeasures as deterrence operations; heightened inspections; improved surveillance and security operations; investigations to determine the full nature and source of the threat; immunizations, isolation, or quarantine; public health and agricultural surveillance and testing processes; and, as appropriate, specific law enforcement operations aimed at deterring, preempting, interdicting, or disrupting illegal activity and apprehending potential perpetrators and bringing them to justice." (**DHS,** *NIPP* **2006**, p. 104; **FEMA** *NIMS* 2007, 156)

Prevention: "Prevention consists of those activities that serve to detect, deter, and disrupt terrorist threats or actions against the United States and its interests. These activities decrease the perpetrators' chance of success, mitigate attack impact, minimize attack visibility, increase the chance of apprehension or detection, and obstruct perpetrators' access to resources. Tasks in this area are important regardless of a single type of threat, adversary capability, time or location of incident. Similarly, these capabilities reflect many tasks routinely undertaken by law enforcement and related organizations as they conduct traditional all-hazards, all-crimes activities. This capability applies to all potential terrorist incidents and is applicable to all 12 terrorism-related National Planning Scenarios. Initial planning, however, has been focused on bombing using improvised explosives device, chlorine tank explosion, aerosol anthrax, improvised nuclear device, and a radiological dispersal.

"Effective prevention depends on timely, accurate, and actionable information about the adversary, their operations, their support, potential targets, and methods of attack. Homeland security intelligence/information fusion is the overarching process of managing the development and flow of information and intelligence across all levels and sectors of government and the private sector on a continual basis. Although the primary emphasis of fusion is to identify, deter, and respond to emerging terrorism-related threats and risks, a collateral benefit to Federal, State, local, and tribal entities is that it will support ongoing efforts to address non-terrorism-related, all-hazards, all-crimes issues." (**DHS**, *TCL*, **2007**, p. 76)

Prevention: "Prevention is a broad term that is often contextually defined. In the context of terrorism employing weapons of mass destruction (WMD), the *National Strategy for Homeland Security* includes the following elements that comprise prevention:

- "…deter all potential terrorists from attacking America through our uncompromising commitment to defeating terrorism wherever it appears."
- "…detect terrorists before they strike."
- "…prevent them and their instruments of terror from entering our country."
- "…take decisive action to eliminate the threat they pose." (**DHS**, *The ODP Guidelines for HS: Prevention and Deterrence*, 2003, p. 2)

Prevention: "Deter all potential terrorists from attacking America, detect terrorists before they strike, prevent them and their instruments of terror from entering our country, and take decisive action to eliminate the threat they pose." (**DHS**, *Universal Task List 2.1*, 2005, p. B-3)

Prevention: "The security procedures undertaken by the public and private sectors in order to discourage terrorist acts." (**DoD**, *DOD Dictionary of Military and Related Terms*, 2007)

Prevention: "Action taken to reduce known risks." (**EEA**, *EEA Environmental Glossary*; cites: **EEA**. 1991. Late lessons from early warnings: the precautionary principle 1896-2000)

Prevention: "The Prevention mission area encompasses activities that serve to detect and disrupt terrorist threats or actions against the United States and its interests. They are actions taken to avoid an incident or to intervene to stop an incident from occurring, and involve actions taken to prevent the loss of lives and property. Prevention involves applying intelligence and other information to a range of activities that may include such countermeasures as deterrence operations; heightened inspections; improved surveillance and security operations; investigations to determine the full nature and source of the threat; public health and agricultural surveillance and testing processes; immunizations, isolation, or quarantine; and, as appropriate, specific law enforcement operations aimed at deterring, preempting, interdicting, or disrupting illegal activity and apprehending potential perpetrators and bringing them to justice. Prevention also includes activities undertaken by the first responder community during the early stages of an incident to reduce the likelihood or consequences of threatened or actual terrorist attacks." (**FEMA,** *HSEEP Glossary*, 2008)

Prevention: "Prevention comprises actions taken and measures put in place to reduce risk of threats and vulnerabilities, to intervene and stop an occurrence, or to mitigate effects of a potential incident, be it naturally occurring or man-made.[103]

> Prevention planning will identify actions that minimize the possibility of a natural or man-made disaster adversely affecting the safety, security, or continuity of the Nation, its critical infrastructures, its inhabitants, and their civil rights and liberties.
>
> Prevention planning for terrorist attacks will focus on reducing the likelihood or consequence of threatened or actual terrorist attacks.[104] These planning efforts will be aligned with the broader efforts of the National Implementation Plan for the War on Terror to disrupt and prevent terrorist attacks on the homeland, deny terrorist and terrorist weapons entry to the United States and disrupt terrorist ability to operate within the borders of the United States. Prevention planning must ensure the complete exploitation of classified and unclassified information to increase the likelihood of successfully thwarting terrorists' plans.[105]

[103] DHS Lexicon Terms and Definitions, Approved October 23, 2007.
[104] HSPD-8, section 2(i), National Preparedness, December 17, 2003
[105] National Implementation Plan for the War on Terror, National Counterterrorism Center, June 26, 2006.

> Many aspects of prevention planning are sensitive and must be produced in and controlled in a classified or law enforcement sensitive environment." (**FEMA**, *(Interim) Integrated Planning System (IPS) for Homeland Security (Draft Version 2.3)*, July 3, 2008 copy, p. 2-6)

Prevention: "Actions to avoid a hazard occurrence, or to avoid or minimize the hazard impact (consequences) if it does occur. Prevention involves actions to protect lives and property. Under HSPD-5, it involves applying intelligence and other information to a range of activities that may include such countermeasures as deterrence operations; heightened inspections; improved surveillance and security operations; investigations to determine the full nature and source of the threat; public health and agricultural surveillance and testing processes; immunizations, isolation, or quarantine; and as appropriate specific law enforcement operations aimed at deterring, preempting, interdicting, or disrupting illegal activity, and apprehending potential perpetrators and bringing them to justice." (**HHS**, *Medical Surge Capacity and Capability Handbook*, August 2004, p. D-9, Glossary)

Prevention/Deterrence: "The ability to detect, prevent, preempt, and deter terrorist attacks and other manmade emergencies." (**Homeland Security Council**, *National Planning Scenarios*, March 2006 Final Draft, p. vi)

Prevention: "Measures that enable an organization to avoid, preclude, or limit the impact of a disruption." (**ISO 22399**, *Societal Security*…, 2007, 5)

Prevention: "Activities to avoid an incident or to stop an emergency from occurring." (**NFPA 1600**, 2007, p. 8)

"Activities, tasks, programs, and systems intended to avoid or intervene in order to stop an incident from occurring. Prevention can apply both to human-caused incidents (such as terrorism, vandalism, sabotage, or human error) as well as to naturally occurring incidents. Prevention of human-caused incidents can include applying intelligence and other information to a range of activities that includes such countermeasures as deterrence operations, heightened inspections, improved surveillance and security operations, investigations to determine the nature and source of the threat, and law enforcement operations directed at deterrence, preemption, interdiction, or disruption." (**NFPA 1600**, 2007, p. 11)

Prevention: "The term 'prevention' means any activity undertaken to avoid, prevent, or stop a threatened or actual act of terrorism." (**Post-Katrina Emergency Management Reform Act of 2006**, p. 1424)

Prevention: "Encompasses activities designed to provide permanent protection from disasters. It includes engineering and other physical protective measures, and also legislative measures controlling land use and urban planning. See also 'preparedness'." (**UNDHA**. *Internationally Agreed Glossary.…*, 1992, 59)

Prevention: "Activities to provide outright avoidance of the adverse impact of hazards and related environmental, technological and biological disasters." (**UN/ISDR** 2002, 25)

Prevention: "(d) Prevention. The Office [Homeland Security] shall coordinate efforts to prevent terrorist attacks within the United States. In performing this function, the Office shall work with Federal, State, and local agencies, and private entities, as appropriate, to:

(i) facilitate the exchange of information among such agencies relating to immigration and visa matters and shipments of cargo; and, working with the Assistant to the President for National Security Affairs, ensure coordination among such agencies to prevent the entry of terrorists and terrorist materials and supplies into the United States and facilitate removal of such terrorists from the United States, when appropriate;

(ii) coordinate efforts to investigate terrorist threats and attacks within the United States; and

(iii) coordinate efforts to improve the security of United States borders, territorial waters, and airspace in order to prevent acts of terrorism within the United States, working with the Assistant to the President for National Security Affairs, when appropriate." (**White House**, *EO 13228, Establishing Office of Homeland Security*, October 8, 2001)

Prevention: "The term 'prevention' refers to activities undertaken by the first responder community during the early stages of an incident to reduce the likelihood or consequences of threatened or actual terrorist attacks." (**White House**, *HSPD-8*, December 2003)

Prevention: "The first priority of homeland security is to prevent terrorist attacks. The United States aims to deter all potential terrorists from attacking America through our uncompromising commitment to defeating terrorism wherever it appears. We also strive to detect terrorists before they strike, to prevent them and their instruments of terror from entering our country, and to take decisive action to eliminate the threat they pose. These efforts—which will be described in both the *National Strategy for Homeland Security* and the *National Strategy for Combating Terrorism*—take place both at home and abroad. The nature of modern terrorism requires a global approach to prevention." (**White House**, *National Strategy for HS*, 2002, p. 2)

Prevention: "The term 'prevention' refers to activities undertaken by the first responder community during the early stages of an incident to reduce the likelihood or consequences of threatened or actual terrorist attacks." (**White House**, *HSPD-8*, December 2003)

Prevention and Protection: "Support federal interagency prevention and protection initiatives through preparedness programs under the authority of the FPC, including coordination with Protective Security Advisors, the law enforcement and intelligence communities, and critical infrastructure and key resource sectors to implement the National Infrastructure Protection Plan and the War on Terrorism National Implementation Plan." (From description of FEMA Regional NPD responsibilities, in **FEMA**, *Regional-National Preparedness CONOPS*, 8Feb2008, p. 14)

Prevention Core Capabilities:
"Prevention core capabilities are at the root of the TPEP [Terrorism Prevention Exercise Program]. They define which terrorism-prevention equipment, personnel, planning, and tasks will be exercised. The program will address the need to exercise certain capabilities and associated critical tasks that are integral to the prevention mission. The prevention core capabilities have been selected from the Target Capabilities List (TCL). The capability

descriptions have been identified and consolidated based on terrorism prevention activities that serve to detect and disrupt terrorist threats or actions against the United States and its interests, and that decrease the likelihood that a specific terrorist threat or plan will be culminated or executed.

"The core capabilities required for successful terrorism prevention operations are inherently intertwined. Therefore, the lines between them are often blurred, with many of the individual capabilities serving functions in more than one mission area. Rather than specific, individual phases of prevention operations, they are interdependent and simultaneously occurring elements of the larger antiterrorism mission. The prevention core capabilities are as follows:

- **Information Gathering and Recognition of Indicators and Warnings (I&W)** involves gathering, consolidating, and retaining raw, unexamined data from various sources. Recognition of I&W is the ability to see in this data the potential indicators and/or warnings of terrorist activities or planning against U.S. citizens, land, infrastructure, and/or allies.
- **Intelligence Analysis and Production** involves the merging of data and information for the purpose of analyzing, linking, and disseminating timely and actionable intelligence with an emphasis on public safety and homeland security. This process focuses on the consolidation of intelligence-community analytical products at the Federal, State, local, and tribal levels for tactical, operational, and strategic use. This capability also includes the examination of raw data to identify threat pictures, recognize potentially harmful patterns, or connect suspicious links to discern potential indicators or warnings.
- **Intelligence/Information Sharing and Dissemination** involves the multi-jurisdictional, multidisciplinary exchange and dissemination of information and intelligence among Federal, State, local, and tribal layers of government, the private sector, and citizens. The primary goal of sharing and disseminating is to facilitate the distribution of relevant, actionable, timely, and preferably unclassified information and/or intelligence that is updated frequently to consumers that need it. More simply, the goal is to get the right information, to the right people, at the right time.
- **Chemical, Biological, Radiological, Nuclear, and/or Explosive (CBRNE) Detection** is the capability to defend against weapons of mass destruction (WMD) through deployment of systems to ensure early detection of the import, transport, manufacture, or release of CBRNE materials.
- **Law Enforcement Investigation and Operations** covers the broad range of activities undertaken by law enforcement and related entities to detect, examine, probe, investigate, and conduct operations related to potential terrorist activities. Current and emerging investigative techniques are used, with emphasis on training, legal frameworks, recognition of indications and warnings, source development, interdiction, and related issues special to antiterrorism activities. (**DHS**, *HSEEP Vol. 5: Prevention Exercises* (Draft), Dec. 2005)

Prevention Exercise Program (PEP): "The Prevention Exercise Program (PEP) is dedicated to provide participants at the Federal, State, tribal, and local levels the tools through which to test

and improve their ability to prevent terrorism. Exercises are intended to produce comprehensive and valuable analyses of prevention capabilities in order to ultimately enhance the Nation's ability to prevent terrorism by preparing information sharing environment stakeholders at the State and local levels to fuse local and National information and intelligence and produce predictive analysis." (**DHS**, *HSEEP*, Vol. V, 2005, p. 5)

Prevention Exercises: "Prevention exercises can be either *discussion-* or *operations-based* and may focus on issues that pertain to information and intelligence sharing, credible threats, surveillance, and/or opposing force or *red team* activity." (**FEMA**, *HSEEP Glossary*, 2008)

Prevention Principle: "This principle allows action to be taken to protect the environment at an early stage. It is now not only a question of repairing damages after they have occurred, but to prevent those damages occurring at all. This principle is not as far-reaching as the precautionary principle. It means in short terms: it is better to prevent than repair." (**European Environment Agency**, *EEA Environmental Glossary*, 2007)

Primary Agencies: "The NRP identifies primary agencies based on authorities, resources and capabilities. When a Federal agency is activated in response to an Incident of National Significance, the primary Federal agency is responsible for orchestrating Federal support within its functional area for an affected State. The primary agency provides staff for the operations functions at fixed and field facilities; notifies and requests assistance from support agencies; manages mission assignments and coordinates with support agencies; plans for short-term and long-term incident management and recovery operations; and, ensures financial and property accountability for ESF activities." (**FEMA**, *Mission Assignment SOPs Draft*, 2007, p. 58)

Primary Agency: "The federal department or agency assigned primary responsibility for managing and coordinating a specific emergency support function in the National Response Plan." (**JCS/DoD**, *Civil Support*, 2007, p. GL-11)

Primary Entry Point (PEP) Stations:

- Currently 34 Tier 1 EAS PEP stations across USA
    - 30 AM radio stations, 3 FM radio stations, 1 State Operations Center
    - Tier 1 PEP stations requirements:
    - Diesel backup generator with fuel sufficient for 30 days of continuous broadcasting without commercial power
    - Landline, satellite, and HF radio connectivity to FEMA OperationCenters
    - Special EAS Encoder/Decoders (ENDECs) with unique EAS codes
    - Generally located just outside of major city area (improves survivability)
    - Other: Fallout shelter, on-site food, and special lightning protection
    - One mobile AM/FM tunable PEP radio station being procured
- Tier 2 EAS PEP radio stations:
    - 3 new PEP stations being provisioned in Alabama, Mississippi, and Florida
    - Meet all requirements of Tier 1 stations except fallout shelter
    - Additional 24 Tier 2 stations planned; at least one for each State/Territory.
- Tier 3 EAS PEP radio stations:
    - 2006/7: New direct EAS link between FEMA and Public Radio satellite net

        - Adds direct FEMA EAS link to public radio affiliates
    - 2006/7: New direct EAS link between FEMA and XM Radio satellite net
        - Adds direct FEMA EAS link over XM Radio network channels
        - XM Radio receivers being added to all Tier 1 and 2 PEP stations
    - Tier 3 stations have a direct communications link to FEMA, but otherwise do not have any special provisioning like the Tier 1 and 2 PEP stations
    - Additional Tier 3 stations planned with major media networks. (**FEMA**, *IPAWS Update*, 2007, slides 12 and 13)

Primary Entry Point Advisory Committee (PEPAC): "PEPAC was established by FEMA [1990] to help manage the 34 EBS Primary Entry Point (PEP) stations across the USA**.** (**FEMA**, *IPAWS Update*, June 2007, 3)

Primary Joint Field Office (JFO): "When incidents impact the entire nation or multiple States or localities, multiple JFOs may be established regionally… In these situations, one of the JFOs may be identified (typically in the most heavily impacted area) to serve as the primary JFO and provide strategic leadership and coordination for the overall incident management effort, as designated by the Secretary." (DHS, *Notice of Change to the National Response Plan* (Version 5.0), May 25, 2006, p. 5)

Primary Mission Essential Functions (PMEFs): "Those department and agency Mission Essential Functions, validated by the NCC, which must be performed in order to support the performance of NEFs before, during, and in the aftermath of an emergency. PMEFs need to be continuous or resumed within 12 hours after an event and maintained for up to 30 days or until normal operations can be resumed." (**DHS**, *FCD 1*, Nov. 2007, P-8)
Primary Mission Essential Functions (PMEFs): "`Primary Mission Essential Functions,' or 'PMEFs,' means those Government Functions that must be performed in order to support or implement the performance of NEFs before, during, and in the aftermath of an emergency." (**White House,** *HSPD-20***,** May 9, 2007)

Primary Mission Essential Functions (PMEFs) Identification: "PMEF identification is an iterative process performed by each department and agency in coordination with the NCC. In order to identify and analyze PMEFs, the following actions will take place…:

- Upon MEF approval by each department or agency head, a joint effort between the NCC and each department or agency Continuity Coordinator and staff will result in a preliminary identification of PMEFs that potentially support NEFs. The joint effort will culminate in the department or agency's submission of PMEF identification results to the NCC for further interagency analysis.
- An interagency board (IAB), established by the NCC, conducts a review of submitted potential PMEFs and validates PMEFs relationship to the NEFs. A risk management methodology (i.e., BIA or BPA) will be used to ensure that the PMEFs are appropriate and relevant.
- Upon confirmation that the IAB has determined that a department or agency's MEF shall serve as a PMEF, each department and agency will revisit the prioritization of their MEF recovery timelines to ensure PMEF criticality.

- The IAB will conduct a BPA to identify and map interagency PMEF processes, workflows, activities, expertise, systems, data, and facilities inherent to the interagency execution of each NEF. The BPA should also define the PMEF relationship to the NEF. In other words, the BPA will define how each NEF is executed via business process flow mapping (i.e., NEF serving as the "end product output" and interagency PMEF serving as the functional "inputs").
- The IAB must also conduct an analysis of interagency PMEF interdependencies within each NEF to accurately depict each department or agency's PMEF execution capability and dependencies. The IAB will conduct NEF-specific BIAs to: (1) identify potential single points of failure(s) that may adversely affect the execution of the interagency PMEF support to NEFs; (2) define the impact of downtime (i.e., impact of delayed PMEF recovery on NEF execution); and (3) define potential PMEF process alternatives/work-around(s) solutions.
- NEF BPA and BIA and interagency list of PMEFs are submitted to the NCC for final approval." (**DHS**, *FCD 1*, Nov. 2007, pp. D-7 & D-8)

Primary Mission Essential Functions (PMEFs) Screening Aid:

- Does the function directly support a NEF?
- Does the function need to be continued uninterrupted or need to be resumed within 12 hours, regardless of circumstance?

The answers to both of these must be 'Yes" for the function to be considered a PMEF. (**DHS**, *FCD 1*, Nov. 2007, p. D-7)

Principal Advisor on Emergency Management: "The Administrator [FEMA] is the principal advisor to the President, the Homeland Security Council, and the Secretary [DHS] for all matters relating to emergency management in the United States." (**FEMA 592**, 2007, p. 96; passage from Title V (National Emergency Management) Sec. 503. Federal Emergency Management Agency (6 U.S.C. 313), Department of Homeland Security Appropriations Act, 2007 (Pub. L. No. 109-295) amending the Homeland Security Act of 2002)

Principal Federal Official (PFO): "For actual or potential national incidents, the Secretary of Homeland Security may designate a Federal officer, either a Principal Federal Official (PFO) and/or a Federal Coordinating Officer (FCO), to serve as his representative locally. Incidents involving presidential declarations of major disasters or emergencies under the Stafford Act require the appointment of an FCO. The PFO provides senior leadership, strategic guidance and operations integration for catastrophic events, terrorist incidents and other high visibility, multi-state, multi-jurisdiction events. The FCO, on the other hand, provides the leadership for managing Federal resource support in a multi-hazard context. While the Secretary has the authority to appoint a PFO for any national incident, *it is most likely that a PFO will be appointed only for incidents or high visibility events with significant national or regional implications such as significant terrorist events causing considerable destruction, catastrophic natural disasters, and complex non-Stafford Act emergencies*." (**DHS**, *National Response Plan* (Draft #1), February 25, **2004**, pp. 18-19; italics added) [Note, compare italicized sentence above with the Jan 2008 NRF: "The Secretary will only appoint a PFO for catastrophic or unusually complex incidents that require extraordinary coordination." (**DHS**, *NRF*, 2008, p.66)

Principal Federal Official (PFO): "The Secretary of Homeland Security is the principal Federal official responsible for domestic incident management. This includes coordinating Federal operations and resource deployments within the United States to prepare for, respond to and recover from terrorist attacks, major disasters or other emergencies." (**DHS**, *NRF Comment Draft*, September **2007**, p. 52)

Principal Federal Official (PFO). "By law and by Presidential directive, the Secretary of Homeland Security is the principal Federal official responsible for coordination of all domestic incidents requiring multi-agency Federal response. *In a catastrophic or unusually complex incident, the Secretary may elect to designate a single individual to serve as his or her primary representative and as the lead Federal official in the field.* Only the most complex incidents will likely call for appointment of a PFO. Acting on the Secretary's behalf, the PFO will coordinate the activities of other Federal officials, acting under their own authorities, to ensure consistency of Federal support as well as the overall effectiveness of the Federal incident management. When appointed, such an individual serves on-scene as the *Principal Federal Official* for the incident.

"The PFO will interface with Federal, State, tribal and local jurisdictional officials regarding the overall Federal incident management strategy and act as the primary Federal spokesperson for coordinated media and public communications. The PFO will serve as a member of the Unified Coordination Group and provide a primary point of contact and situational awareness locally for the Secretary of Homeland Security.

"*A PFO is a senior Federal official with proven management experience and strong leadership capabilities. The PFO deploys with a small, highly-trained mobile support staff.* Both the PFO and support staff undergo specific training prior to appointment to their respective positions. Once formally designated for an ongoing incident, a PFO relinquishes the conduct of all previous duties to focus exclusively on his or her incident management responsibilities.

"This *Framework* stipulates that *the same individual will not serve as the Principal Federal Official and the Federal Coordinating Officer…at the same time for the same incident.* When both positions are assigned, circumstances will be such that each will have significant, complementary responsibilities to assist with response to a very demanding event. The Secretary is not restricted to DHS officials when selecting a PFO.

"*The PFO does not direct or replace the incident command structure established at the incident.* Nor does the PFO have line authority over a Federal Coordinating Officer, a Senior Federal Law Enforcement Official, a DOD Joint Task Force Commander or any State or local official. Other Federal incident management officials retain their authorities as defined in existing statutes and directives. Rather, the PFO promotes cohesion and, as possible, resolves any Federal interagency conflict that may arise. The PFO identifies and presents to the Secretary of Homeland Security any policy issues arising from the particular circumstances that need resolution at a higher level within the Federal Government." (**DHS**, *NRF Comment Draft*, September **2007**, pp. 63-64)

Principal Federal Official (PFO), Federal Coordinating Officer (FCO) Responsibilities: "The Secretary may elect to designate a single individual to serve as his or her primary representative to ensure consistency of Federal support as well as the overall effectiveness of the

Federal incident management. When appointed, such an individual serves in the field as the PFO for the incident. The Secretary will only appoint a PFO for catastrophic or unusually complex incidents that require extraordinary coordination. When appointed, the PFO interfaces with Federal, State, tribal, and local jurisdictional officials regarding the overall Federal incident management strategy and acts as the primary Federal spokesperson for coordinated media and public communications.

"For Stafford Act incidents (i.e., Presidentially declared emergencies or major disasters), upon the recommendation of the FEMA Administrator and the Secretary of Homeland Security, the President appoints an FCO. The FCO is a senior FEMA official trained, certified, and well experienced in emergency management, and specifically appointed to coordinate Federal support in the response to and recovery from emergencies and major disasters. The FCO executes Stafford Act authorities, including commitment of FEMA resources and the mission assignment of other Federal departments or agencies. The same individual will *not* serve as the PFO and the FCO at the same time for the same incident." (**DHS**, *NRF FAQs*, Jan 2008, 6)

Principal Federal Official (PFO) (Pre-Designated, Delegation Authority): "In certain scenarios, a PFO may be pre-designated by the Secretary of Homeland Security to facilitate Federal domestic incident planning and coordination at the local level outside the context of a specific threat or incident. A PFO also may be designated in a pre-incident mode for a specific geographic area based on threat and other considerations. In the event of a single incident with national implications or in the case of multiple incidents, a national-level PFO may be designated to provide overall coordination of Federal incident management activities. The PFO may further delegate duties to a Deputy PFO, the FCO or other designated Federal official as appropriate to facilitate incident management span of control or after an event transitions to long-term recovery and/or cleanup operations." (**DHS**, *Notice of Change to the National Response Plan* (Version 5.0), May 25, 2006, p. 5)

Principal Federal Official (PFO): "Once formally designated, PFOs relinquish the conduct of all normal day-to-day duties and functions. PFOs typically may not be "dualhatted" with any other roles or responsibilities that could detract from their overall incident management responsibilities. However, the Secretary may, in other than terrorism incidents choose to combine the roles of the PFO and FCO in a single individual to help ensure synchronized Federal coordination." (**DHS**, *Notice of Change to the National Response Plan*, May 25, 2006, p. 5)

Principal Federal Official (PFO): "The Principal Federal Official (or the successor thereto) shall not—(A) direct or replace the incident command structure established at the incident; or (B) have directive authority over the Senior Federal Law Enforcement Official, Federal Coordinating Officer, or other Federal and State officials." (**FEMA 592**, 2007, p. 105; passage from Title V (National Emergency Management) Sec. 509. National Integration Center (6 U.S.C. 319), Department of Homeland Security Appropriations Act, 2007 (Pub. L. No. 109-295) amending the Homeland Security Act of 2002)

Principal Federal Official (PFO): "Depending upon the scope and magnitude of the incident, the DHS Secretary may appoint a PFO to be the Secretary's "point person" on the ground to oversee Department operations. The PFO may provide suggestions to the Federal Coordinating

Officer (FCO) in coordinating the interagency response that may lead to issuance of mission assignments." (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 2007, p. 5; see also 58)

Principal Federal Official (PFO): "The Federal official designated by the Secretary of Homeland Security to act as his/her representative locally to oversee, coordinate, and execute the Secretary's incident management responsibilities under HSPD-5 for Incidents of National Significance." (**USCG**, *IM Handbook*, 2006, Glossary 25-20)

Principles for Domestic Emergencies (NSDD 47, 1982): "Emergency mobilization preparedness programs for domestic emergencies will be based on the following principles:

- Preparedness measures must reflect the Constitutional roles of the Federal, State and local governments. In peacetime, principal responsibility for preparing for, and responding to, domestic emergencies rests with State and local governments.
- Primary emphasis should be placed on natural disasters or other domestic emergencies of a catastrophic nature that cannot be managed effectively without substantial Federal presence; or, arise within spheres of activity in which there is an established Federal preeminence.
- Federal preparedness measures should assist State and local jurisdictions in increasing their capabilities to meet their responsibilities.
- Domestic preparedness programs should be developed in close coordination with the private sector.
- Preparedness measures for allocation of resources during domestic emergencies should rely on market-based mechanisms.
- Economic stabilization preparedness measures should provide mechanisms that do not rely on the imposition of direct economic controls.
- Preparedness measures for domestic emergencies should facilitate responses which may be necessary for only temporary and selective departures from established public policies. Equally, such measures should aim for the prompt restoration of routine policies and programs." (**White House**, *NSDD 47*, 1982, p. 4)

Principles of Civil Defense:

- Joint Responsibility of Federal Government/States and Communities
- Leadership
- Flexible (peacetime program adaptable to war conditions; federal template modified by states; changes with the times)
- Use Existing Agencies
- Organize Volunteers
- Civilian and non-partisan (**OCDP**, *Hopley Report*, 1948, pp 14-17)

Principles of Emergency Management: "…there are some fundamental principles we follow at DHS with respect to emergency management. These are principles grounded in the wisdom of the emergency management community and those who have spent entire careers dealing with hurricanes and other kinds of disasters.

"First and foremost, we recognize that state and local governments are the primary first responders in a disaster. And there is a good reason for this. Disasters, by their very nature, occur locally – in communities far removed from federal assets. State and local responders are the first on the scene and are most attuned to the needs and concerns of local populations. This fundamental fact is not going to change and the Federal government has no interest in superseding your authority to protect and serve your citizens….

"I'd like to talk for a minute about the standard framework for managing a disaster – because the fact of the matter is that we may need to do some things differently this year, particularly in the Gulf.

"By law, local government is responsible for providing for the safety and security of citizens in advance of a hurricane. That means they are in charge of developing emergency plans, determining evacuation routes, providing public transportation for those who can't self-evacuate, and setting up and stocking local shelters with relief supplies.

"State government is responsible for mobilizing the National Guard, pre-positioning certain assets and supplies, and setting up the state's emergency management functions. They are also in charge of requests for Federal support though the formal disaster declaration process.

"The Federal government is responsible for meeting those requests from the state – both during the disaster and in its aftermath. As we saw during Katrina, that includes logistical support for search and rescue, providing food, water and ice, establishing disaster centers and processing federal disaster claims, and participating in short- and long-term public works projects – such as debris removal and infrastructure rebuilding. This is the basic framework." (DHS, *Remarks as Prepared for Delivery by Homeland Security Secretary Michael Chertoff at the National Hurricane Conference*, April 12, 2006)

Principles of Emergency Management:

1. **Comprehensive** – emergency managers consider and take into account all hazards, all phases, all stakeholders and all impacts relevant to disasters.
2. **Progressive** – emergency managers anticipate future disasters and take preventive and preparatory measures to build disaster-resistant and disaster-resilient communities.
3. **Risk-driven** – emergency managers use sound risk management principles (hazard identification, risk analysis, and impact analysis) in assigning priorities and resources.
4. **Integrated** – emergency managers ensure unity of effort among all levels of government and all elements of a community.
5. **Collaborative** – emergency managers create and sustain broad and sincere relationships among individuals and organizations to encourage trust, advocate a team atmosphere, build consensus, and facilitate communication.
6. **Coordinated** – emergency managers synchronize the activities of all relevant stakeholders to achieve a common purpose.
7. **Flexible** – emergency managers use creative and innovative approaches in solving disaster challenges.

8. **Professional** – emergency managers value a science and knowledge-based approach based on education, training, experience, ethical practice, public stewardship and continuous improvement. (**Emergency Management Roundtable**, Sep. 11, 2007, p. 4)

Principles of Homeland Security: "Guiding Principles:

- Make America "*Safer, Stronger, and Better*."
- Recognize the effects of all terrorist attacks occur locally.
- Maximize collective efforts to prevent terrorist attacks, reduce risks, and respond effectively to attacks that do occur.
- Assure that efforts are State based but locally focused and driven—*flexible, scalable, and adaptable*.
- Recognize that our enemy is networked and can only be defeated by a networked system – therefore homeland defense must resemble networked PCs rather than a mainframe computer.
- Ensure that our homeland security efforts do not result in significant alteration of our federalist form of government.
- Empower state and local officials' Homeland Security efforts, leveraging existing emergency preparedness and response programs and capabilities to meet emerging threats to the Nation and its citizens.
- Promote interoperable and reliable telecommunications capabilities nationwide.
- Promote integrated and collective training, exercises and evaluations.
- Facilitate the adoption of best practices from other jurisdictions.
- Enable government and private sector at all levels the ability to carry out its Homeland Security responsibilities.
- Promote citizen participation in state, local, private sector and regional homeland security efforts through volunteer service activities, preparedness, education and awareness.
- Ensure funding follows policy.
- Process matters—specific measures of performance in plans drive clarity, accountability, and success.
- The *Homeland* will be secure when *Hometowns* are secure. (**PHSAC**, *STI*. 2003, 3)

Principles of Homeland Security Strategy: "…eight principles have shaped the design of the *National Strategy for Homeland Security.*

Require responsibility and accountability…
Mobilize our entire society…
Manage risk and allocate resources judiciously…
Seek opportunity out of adversity…
Foster flexibility…
Measure preparedness…
Sustain efforts over the long term…
Constrain government spending." (**White House**, *National HS Strategy*, 2002, pp. 3-4)

Principles of the Homeland Security Enterprise, Proposed "Guiding Principles":

- **Citizen Focused** – engaging citizens to set priorities, develop plans, participate as volunteers, and demand accountability in their role as owners of our government.

- **Collaborative** – requiring leaders throughout the enterprise to work together as never before to achieve results that transcend organizational boundaries and individual egos.

- **Strategic** – articulating clear goals and measures, based on an analysis of threats and vulnerabilities; creating coordinated action plans; employing pilot programs and rigorous evaluations to identify, refine, replicate, and share best practices.

- **Innovative** – pioneering new approaches, unusual partnerships, state of the art technology, and creative thinking.

- **Trustworthy** – assuring appropriate degrees of balance, transparency, limits, and openness to build public trust in the homeland security enterprise.

- **Accountable** – setting clear performance measures against which leaders at all levels can be held publicly accountable for specific results in specific timeframes. (*Council for Excellence in* Government, *We the People: Homeland Security…* May 2004, p. 9)

Principles of Incident Response:
- Engaged partnership
- Tiered response
- Scalable, flexible, and adaptive operational capabilities
- Unity of effort through unified command
- Readiness to act. (**DHS**, *NRF*, Jan 2008, 8)

Principles of Pandemic Preparedness: "This report calls for a new paradigm for pandemic preparedness based on the following general principles:

1. *Health*—The goal of preparing for a pandemic is to protect the lives and health of all people in America…
2. *Justice*—Preparation for a potential pandemic (or any disaster) should ensure a fair distribution of the benefits and burdens of precautions and responses and equal respect for the dignity and autonomy of each individual.
3. *Transparency*—Pandemic preparedness requires transparent communication of accurate information among all levels of government and the public in order to warrant public trust.
4. *Accountability*—Everyone, including private individuals and organizations and government agencies and officials, should be accountable for their actions before, during and after an emergency." (**ACLU**, *Pandemic Preparedness*, 2008, 7)

Principles of Survivable Crisis Management (SCM):

- A basic emergency response capability is needed to deal with any disaster.
- Key preparedness elements are common to all emergencies.

- Every State and Territory can experience a wide range of emergencies from natural disasters to terrorism and war.
- Any jurisdiction can experience more than one severe emergency at a time.
- Any emergency may affect several jurisdictions at the same time.
- Federal, State, and local coordination is essential to comprehensive national emergency preparedness.
- To respond effectively. Governments must be able to survive and continue to direct and control emergency operations. (**FEMA**, *An Introduction to SCM*, 1992, 3)

Principles of War:

Objective
Mass
Maneuver
Offensive
Economy of Force
Unity of Command
Simplicity
Surprise
Security (**USCG** *Pub 1*, 2002, p. 64-65)

Principles of War, Strategic Level:

- **Objective**: Identify and pursue clearly defined and attainable goals whose achievement best furthers the national interest(s).
- **Initiative**: Seize, retain, and exploit the initiative.
- **Unity of Effort**: For every objective coordinate all activities to achieve unity of effort.
- **Focus**: Concentrate the elements of national power at the place and time which best furthers pursuit of the primary national objective.
- **Economy of Effort**: Allocate minimum essential resources to subordinate priorities.
- **Orchestration**: Orchestrate the application of resources at the times, places, and in ways which best further the accomplishment of the objective.
- **Clarity**: Prepare clear strategies that do not exceed the abilities of the organizations that will implement them.
- **Surprise**: Accrue disproportionate advantage through action for which an adversary is not prepared.
- **Security**: Minimize the vulnerability of strategic plans, activities, relationships, and systems to manipulation and interference by opponents. (**Johnsen**, et al, *The Principles of War in the 21st Century: Strategic Considerations,* 1995, p. iv)

Prioritization: "The ordering of critical activities and their dependencies are established during the BIA and Strategic-planning phase. The business continuity plans will be implemented in the order necessary at the time of the event." (**DigitalCare**, *State of OR BC Workshop*, 2006, p. 61)

Private Nonprofit Facility: "(A) In General - The term "private nonprofit facility" means private nonprofit educational, utility, irrigation, emergency, medical, rehabilitational, and temporary or permanent custodial care facilities (including those for the aged and disabled) and facilities on Indian reservations, as defined by the President. (B) Additional Facilities – In

addition to the facilities described in subparagraph (A), the term "private nonprofit facility" includes any private nonprofit facility that provides essential services of a governmental nature to the general public (including museums, zoos, performing arts facilities, community arts centers, libraries, homeless shelters, senior citizen centers, rehabilitation facilities, shelter workshops, and facilities that provide health and safety services of a governmental nature), as defined by the President." (**Stafford Act**, June 2006 (FEMA 592), p. 15)

Private Sector Senior Advisory Committee (PVTSAC): "The Secretary of Homeland Security established the PVTSAC as a subcommittee of the HSAC [Homeland Security Advisory Committee] to provide the HSAC with expert advice from leaders in the private Sector." (**HHS,** *NIPP*, 2006, p. 27)

PRND: Preventable Radiological Nuclear Detection. (**DHS/OIG**, *DNDO Progress*, 2007, 39)

Probable Maximum Flood (PMF): "…the flood that may be expected from the most severe combination of critical meteorologic and hydrologic conditions that are reasonably possible in the drainage basin under study." (**USACE**, *Engineering Pamphlet EP 1165-2-1*, 1999)

Probable Maximum Precipitation (PMP): "Theoretically, the PMP is the greatest depth of precipitation for a given duration that is physically possible over a given size storm area at a particular geographical location during a certain time of the year. Development of the PMP considers all storms of record and the observed precipitation is increased by maximizing the moisture inflows to the storm system. Generalized depth-area-duration and seasonal relationships for the continental U.S. are published by the National Weather Service in a series of hydrometeorological reports." (**USACE**, *Water Resources Policies and Authorities*, 1999, 13-2)

Probability: "The likelihood that an event will occur." (**FEMA**, *Hazards Analysis for Emergency Management (Interim Guidance)*, CPG 1-101, September 1983, p. 5)

Probability: "Extent to which an event is likely to occur." (**ISO 22399**, 2007, 5)

Probability: The likelihood of a specific outcome, measured by the ratio of specific outcomes to the total number of possible outcomes. Probability is expressed as a number between 0 and 1, with 0 indicating an impossible outcome and 1 indicating an outcome is certain. (**Standards Australia/New Zealand** 1995)

Probability Analysis: The derivation of both the likelihood of incidents occurring and the likelihood of particular outcomes (or effects) should those events occur. (**NSW** 1989)

Probability and Frequency: "Probability and Frequency means a measure of how often an event is likely to occur. Frequency can be expressed as the average time between occurrences or exceedances (non-exceedances) of an event or the percent chance or probability of the event occurring or being exceeded (not exceeded) in a given year or a longer time period." (**FEMA**, *Multi Hazard Identification and Risk Assessment*, 1997, p. xxv)

Problem-Based Learning (PBL): "Problem-based learning (PBL) is an instructional method that challenges students to "learn to learn," working cooperatively in groups to seek solutions to real world problems. These problems are used to engage students' curiosity and initiate learning the subject matter. PBL prepares students to think critically and analytically, and to find and use appropriate learning resources." (**Barbara Dutch**, *Problem-Based Learning*, Univ. of Delaware)

Procedural Flow (ProFlow): "The ProFlow is an exercise document that outlines a sequential flow of actions anticipated from *participating* organizations in response to a hypothetical situation. The ProFlow allows *controllers* and *evaluators* to track and monitor expected actions to ensure their completion at designated times. (Note: The ProFlow differs from the *MSEL* in that it contains only expected player actions such as establishing decontamination, triage, treatment, and transport.) Typically, ProFlows are only produced for large-scale, complex exercises." (**FEMA**, *Homeland Security Exercise & Evaluation Program Glossary*, 2008)

Processing and Exploitation: "Converting raw information/data into formats that can be efficiently and effectively used by executives, managers, analysts and investigators. Examples of Processing and Exploitation include:

- Imagery interpretation
- Data conversion and correlation
- Document and eavesdropping translations
- Key Word searches on seized data
- Facial Recognition searches involving image capture systems, records, databases, etc
- Data Mining in seized or open source databases
- Decryption of seized or intercepted data" (**FEMA**, *IIFOG Version 3 Draft*, 2008, 39)

Proclamation 7463: *Declaration of National Emergency by Reason of Certain Terrorist Attacks*. (**White House**, September 18, 2001)

Procurement Unit (ICS): "The unit within the Finance/Administration Section responsible for financial matters involving vendor contracts." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 56)

Production: "The documentation and creation of finished and/or raw intelligence/information including records, data, warnings, reports, briefings, bulletins, biographies, assessments, in a conventional, analog and/or digital format utilizing text, images, audios and data." (**FEMA**, *IIFOG Version 3 Draft*, 2008, 39)

Professional (Core Principle of Emergency Management): "Professional: emergency managers value a science and knowledge-based approach based on education, training, experience, ethical practice, public stewardship and continuous improvement." (**EM Roundtable**, 2007, p. 4)

Professionalism – Continuous Improvement and Accountability: "...William Jenkins, the director of Homeland Security and Justice Issues for the U.S. Government Accountability Office, told the Commission that California must take on the difficult challenge of promoting

performance. He commented that the basic steps are easy to list, but extremely difficult to complete:

- Develop a strategic plan with clear goals, objectives and milestones.
- Develop performance goals that can be used to set desired performance baselines.
- Collect and analyze relevant and reliable data.
- Assess…results of analyzing…data against performance goals to guide priority setting.
- Take action based on those results.
- Monitor the effectiveness of actions taken to achieve the designated performance goals." (**Little Hoover Com**., *Safeguarding the Golden State*, Promote Continuous Improvement and Accountability section, 2006, 60-61)

Professional Development of Architects and Engineers: "The primary and immeediate objective of this program during fiscal year 1962 was to qualify architects and engineers to help identify existing fallout shelter…. To assure this capability, knowledge gleaned from research, development, and testing is transmitted to selected faculty members of schools of architecture and engineering, who are encouraged to share their knowledge with their students and with active members of their profession by means of professional development programs." (**OCD**, *Annual Report 1962*, p. 36)

Program: "A group of related initiatives managed in a coordinated way, so as to obtain a level of control and benefits that would not be possible from the individual management of the initiatives. Programs may include elements of related work outside the scope of the discrete initiatives in the program." (**DHS**, *FCD 1*, Nov. 2007, P-8)

Program: "NFPA 1600 defines the criteria for development of a program. According to the standard, the term *program* refers to 'a system of plans, procedures, and activities designed to achieve a specific goal.' An emergency management and business continuity program typically involves many different people, systems, equipment, policies, plans, and procedures that must be identified, organized, implemented, reviewed, evaluated, and maintained. An emergency management and business continuity program should be developed following a systematic process, then implemented and periodically assessed to ensure that it meets the evolving needs of the organization." (**NFPA**, *Implementing NFPA 1600*, 2007, p. 4)

Program and Capability Enhancement Plan: "The analytical output of the Program and Capability Review will be captured in the Program and Capability Enhancement Plan. The Enhancement Plan is a comprehensive program management plan that looks at homeland security irrespective of preparedness funding streams." **(DHS**, *State Homeland Security Program and Capability Review Guidebook Vol. 1***.** October 2005, p. 5)

Program and Capability Review: "In the Program Review, States are essentially being asked to consider two high-level questions: 1) *Is the State program executing the appropriate activities to operate and manage the homeland security program?* and 2) *Has the State organized itself and established governance structures to effectively manage those activities?* To answer these questions, States will evaluate current homeland security program management capacity, baseline operations, and future program needs. An effective homeland security program requires sound program management structures that help ensure the program is capable of conducting

business across departments, agencies, and disciplines at all levels of government. Successful efforts to build capabilities hinge on effective homeland security program management and operations. Understanding program management challenges can help address homeland security needs that support statewide efforts to enhance and sustain capabilities." **(DHS**, *State Homeland Security Program and Capability Review Guidebook Vol. 1.* October 2005, p. 5)

Program Effectivness: "Program effectiveness depends on three main variables: capability, capacity and coverage.

- Capability: The program's ability to perform its role in reducing risk at the asset, team, or force package level.
- Capacity: How much capability you have. The amount of operational assets, teams or force packages available.
- Coverage: How the program's capacity is arrayed, in time and space, against the risk exposure served by the program." (**DHS**, *IPG FY 2011-2015 Draft*, p. 9)

Program for Response Options and Technology Enhancement Against Chemical/Biological Terrorism (PROTECT), Washington, DC: "A partnership was formed in 1999, between the Washington Metropolitan Area Transit Authority and several Federal agencies to include the U.S. Departments of Energy (DOE), Justice (DOJ), and Transportation (DOT) to advance the efforts to improve the safety and security of the Metrorail system against chemical or biological terrorism. The federal partners and several National laboratories offered installation direction and testing of the chemical sensor system. WMATA is utilizing a sensor system designed to act as an early warning system to safeguard first responders, employees, and customers on its subway system. WMATA is the first transit property in the United States to implement a strategic test program of this nature. The chemical detection system is performing to specifications. The system will be expanded throughout the Metrorail system to add additional technology as it becomes available. In addition to the PROTECT system, the Metro Transit Police Department has provided small, devices to its officers that they can wear in the Metrorail system that detect radiation. The devices notify the officer of the presence of radiation so further investigation may be employed. The department has also deployed hand held radiation sensor equipment to its specialized units." (**WMATA**, *PROTECT and the WMATA*) [**PROTECT** "was transitioned from DHS support in summer 2003 and has been operated by WMATA since that time." (**DHS, NCRC**, *First Annual Report, 2005*, p. 94)]

Program Management Technical Assistance: "The Program Management TA builds off the existing Program Management Handbook, incorporates the vision for preparedness outlined in the National Preparedness Goal, and provides guidance on how to apply program management concepts to multi-jurisdictional and multi-disciplinary programs. Specific components include:
• Identifying and coordinating with key stakeholders from neighboring jurisdictions and across multiple disciplines;
• Assessing programmatic and preparedness strengths and weaknesses and planning approaches;
• Developing a program staffing and budget plan that is aligned with the state's strategic plans; and
• Evaluating interdependencies and challenges specific to urban area, state or region." (DHS, *G&T Information Bulletin No. 221, Subject: Investment Planning and Program Management Technical Assistance*, October 2, 2006, pages 1-2)

Progressive (**Core Principle of Emergency Management):** "Progressive: emergency managers anticipate future disasters and take preventive and preparatory measures to build disaster-resistant and disaster-resilient communities." (**EM Roundtable**, 2007, p. 4)

Project BioShield: "On July 21, 2004, President George W. Bush signed the Project BioShield Act of 2004 (Project BioShield) into law as part of a broader strategy to defend America against the threat of weapons of mass destruction. The purpose of Project BioShield is to accelerate the research, development, purchase, and availability of effective medical countermeasures against biological, chemical, radiological, and nuclear (CBRN) agents." (**HHS**, *Project BioShield*, August 30, 2007 revision, p. 1)

Project BioShield: "During its first two years of implementation, Project BioShield acquisitions were guided by requirements derived from interagency deliberations in 2003 that involved Cabinet-level Departments and the Executive Office of the President. Under this initial strategy, HHS pursued acquisitions for those highest priority threats for which there were candidate products at relatively advanced stages of development and for which there were opportunities to have a significant impact on improving preparedness. These products included medical countermeasures for anthrax, smallpox, botulinum toxins, and radiological/nuclear agents - the four threat agents initially determined by DHS to pose a material threat to national security. Acquisitions under Project BioShield to date include the currently licensed anthrax vaccine, anthrax therapeutics (monoclonal and human immune globulin), a pediatric formulation of potassium iodide to protect against absorption of radioactive iodine, calcium and zinc diethylenetriaminepentaacetate (DTPA), chelating agents to treat ingestion of certain radiological particles, and botulinum antitoxin." (**HHS**, *HHS PHEMCE Implementation Plan for CBRN Threats*, April 2007, p. 3)

Project East River: A "broad study of the measures necessary to an effective civil defense of the United States against all forms of attack…conducted by Associated Universities, Inc…. In additon to outlining the military measures precedent to a manageable civil defense and the measures essential to caryying out reduction of urban vulnerability, Project East River analyzed the overall civil defense problem, organization, and projected program. The resulting reports contained more than 200 specific recommendations…

Project East River recommended that the following principles and concepts be accepted as the essential framework upon which an adequate civil defense system can be built:

- Civil defense must be a permanent partner in national defense….
- The civil defense program must emphasize, as a positive goal of first priority, those activities that will improve the individual citizen's chance of survival and minimize his proper damage in the case of enemy attack….
- A civilain civil defense must be developed to the maximum degree possible….
- Civil defense must be organized and operated on the principle that existing agencies and facilities should be used to the greatest extent possible….

- Civil defense must be accomplished, in the main, as an extension of the normal duties of various officials at all levels of government, assisted by volunteers and volunteer organizations….
- Dual use of equipment and facilities for civil defense should be encouraged to the maximum practical degree….
- All areas of the United States are not of equal vulnerability to the several elements of the threat and civil defense programs must be adjusted to the requirements of the individual area….
- Reduction of target vulnerability is an essential function of civil defense…." (**FCDA**, *1953 Annual Report*, pp. 62-63)

Project Impact, Building a Disaster Resistant Community: "James Lee Witt, director of the Federal Emergency Management Agency (FEMA), introduced Project Impact in 1997 [November 6][106] in an effort to "protect families, businesses, and communities by reducing the impact of natural disasters," Through its four-pronged program, Project Impact builds safe communities when individuals, businesses, and community leaders take the following steps:

- Identify and recruit Project Impact partners in the community such as local government leaders, civic and volunteer groups, businesses, and individual citizens.
- Determine the community's risk for falling victim to natural disasters.
- Set priorities and target resources to reduce impact of future disasters.
- Keep the entire community informed and focused on Project Impact's ability to reduce damage and costs of future disasters." (**FEMA**, *Project Impact: Building A Disaster-Resistant Community*, November 22, 1999)

Project Impact, Building a Disaster Resistant Community: "On November 6, the Federal Emergency Management Agency (FEMA) launched Project Impact: Building a Disaster Resistant Community, an initiative designed to challenge the country to undertake actions that protect families, businesses and communities by reducing the effects of natural disasters. We've got to change the way we deal with disasters. We have to break the damage-repair, damage-repair cycle. We need to have communities and businesses come together to reduce the costs and consequences of disasters. It is our number one priority at FEMA. Project Impact includes a national awareness campaign, the selection of pilot communities that demonstrate the benefits of hazard mitigation through a partnership approach, and an outreach effort to businesses and communities using a new guidebook that offers a formula for a community or business to follow to become disaster resistant. *Rationale*: The increasing number and severity of natural disasters the past decade demands that action be taken to reduce the threat that hurricanes, severe storms, earthquakes, floods and wildfires impose upon the economic stability, economic future and safety of the citizens of the U.S. As the federal agency responsible for emergency management, FEMA is committed to reducing disaster losses by focusing the energy of businesses, citizens, and communities in the U.S. on the importance of reducing their

[106] Witt, James Lee. "Project Impact: Building a Disaster Resistant Community." *Disaster Recovery Journal*, Winter 1998/ Accessed at: http://www.drj.com/win98/witt.htm

susceptibility to the impact of natural disasters." (**Witt**, "Project Impact: Building a Disaster Resistant Community," *Disaster Recovery Journal*, Winter 1998)

Project Impact, Building a Disaster Resistant Community, Business and Industry: "Part of what we're trying to address in the Disaster Resistant Communities process is bringing business and industry into this partnership -- not just as a vital member but, more importantly, to work with business and industry to establish some common denominators for their protection, the protection of their employees, and increased involvement in the community. There are three central elements to this process:

1. It is critical that business and industry understand the need to protect themselves. This process is made much easier once risk identification has been conducted because they can then target specific threats that could have a significant impact….

2. The second element is for business and industry to take care of their employees -- they need to provide them with information on how to protect their homes and their families and the appropriate steps to take if disaster strikes….

3. The third element is for business and industry to be involved in the community in disaster preparedness and mitigation efforts." (**Witt**, "Creating Disaster Resistant Communities." 1999)

Project Impact, Building a Disaster Resistant Community, Four Phases (Steps): "Essentially, *Project Impact* is a planning based approach that challenges and supports communities to become disaster resistant. FEMA encourages your community to participate in the four phases of the Project Impact Initiative.

Building Community Partnerships. This initiative is most effective if it draws upon the experiences, resources, and policies already in place in your community. Identify and recruit Project Impact Partners that reflect all sectors: local government leaders, civic and volunteer organizations, businesses, and individual citizens.

Assessing Risks. Identify hazards to determine which areas of your community are affected by disasters, how likely it is that the disaster may occur, and the magnitude of the disaster. Assess the vulnerability of buildings, utilities, and transportation systems serving the community.

Prioritizing Mitigation Efforts. Identify mitigation priorities and mitigation measures to address these priorities. Determine resources needed to implement these measures and identify potential sources for technical and financial assistance.

Communicating Success. Use the print, radio, and television media to build support for the *Project Impact* initiative and to bring the message of the benefits of mitigation to all residents and businesses in the community." (**FEMA**, *Disaster Prevention: A Catalyst for Change* (Chapter 2), p 13)

Project Impact, Building a Disaster Resistant Community, Rationale: "Last week I visited a subdivision of 54 homes in Wichita, Kansas. The families were going through the wreckage of

their homes...sifting through the muck and stink left when the Arkansas River overflowed its banks on Nov. 1 . People were pulling out their carpets and putting their water soaked furniture on their curb. It was a terrible scene but one I have witnessed over and over again in the past 5 years. In fact, it was a scene that had been repeated five times in recent years in this very subdivision.

The sad truth is, this scene should never have taken place much less been repeated. The fact is...we have the opportunity to cut losses...the know-how to reduce risks...and the responsibility to save lives. But it means we must change the way we think and plan and budget. It means that instead of responding to disasters...we must prevent them...instead of waiting to react, we prepare NOW for the next flood, hurricane, fire or earthquake. And that's exactly what we have been doing at FEMA through our Project Impact initiative to build disaster resistant communities. We are working with our State and local partners in 57 communities all across America...and we are changing the face of emergency management in this country...we are shifting to proactive prevention….

These days, disasters are becoming daily occurrences. Regardless of whether you believe the cause is global warming or natural changes in weather patterns, there is no disagreement that the frequency and severity of what we call "weather events" are on the rise." (**Witt**, *Disaster Recovery Journal*)

Project Impact, Building a Disaster Resistant Community, Three Primary Tenets: "There are three primary tenets of the Project Impact initiative:

- Mitigation is a local issue. It is best addressed through a local partnership involving government, business and private citizens.
- Private sector participation is essential. Disasters threaten the economic and commercial growth of our cities, towns, villages and counties. Without the participation of the private sector, comprehensive solutions will not be developed.
- Mitigation is a long-term effort that requires long-term investment. Disaster losses will not be eliminated overnight. (**Witt**, "Project Impact: Building a Disaster Resistant Community," *Disaster Recovery Journal*, Winter 1998)

Proposed Statement of Work (PSOW): "A <u>preliminary</u> statement of work prepared by the Primary Department/Agency (D/A) of an Emergency Support Function prior to an event (e.g., major disaster or emergency). The key components of a PSOW are the scope of work (e.g., specific tasks to be performed, requirements or criteria to be followed) and a projected cost estimate. Preparation of the PSOW is the first step in the development of a Pre-Scripted Mission Assignment." (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 2007, p. 58)

Proposition 127: Measure passed by California voters in 1990 which exempts seismic rehabilitation improvements to buildings from property tax reassessments. (**Financial Services Roundtable**, *Nation Unprepared for Mega-Catastrophe*, 2007, 37)

PROTECT: Program for Response Options and Technology Enhancements for Chemical Terrorism, Washington, DC. (**WMATA**, *PROTECT and the WMATA*)

Protect: "Protection operations are those geared at taking defensive steps designed to provide lines of defense to stop an attack if preventative actions are unable to preclude a terrorist or criminal operation from being initiated, and to shield or safeguard the Nation, or to keep from harm, injury or attack. Protection includes safeguarding people and their freedoms, critical infrastructure, property, and the economy of our nation from acts of terrorism, natural disasters, or other emergencies." (**DHS**, *Capstone Doctrine Pub 1 Draft*, Chapter 2, 2008, p. 2-5)

Protect: "Protect – to cover or shield from exposure, injury, or destruction." (**DHS**, *Critical Infrastructure Task Force Presentation to HSAC,* January 10, 2006)

Protect: "Actions to reduce the vulnerability of critical infrastructure or key resources in order to deter, mitigate, or neutralize terrorist attacks, major disasters, and other emergencies Source—HSPD 7, December 2003). It requires coordinated action on the part of federal, state, and local governments; the private sector; and concerned citizens across the country. Protection also includes: continuity of government and operations planning; awareness elevation and understanding of threats and vulnerabilities to their critical facilities, systems, and functions; identification and promotion of effective sector-specific protection practices and methodologies; and expansion of voluntary security-related information sharing among private entities within the sector, as well as between government and private entities. (Source – The National Strategy For The Physical Protection of Critical Infrastructures and Key Assets, February 2003)." (**DHS/ODP**, *State and Urban Area Homeland Security Strategy: Guidance*…, 2005, pp. 3-4)

Protect: "Reduce the likelihood of attack on assets or systems and limit the impact should an attack occur." (**DHS**, *Universal Task List*, *Version 2.1*, 2005, p. 38)

Protect: "The terms 'protect' and 'secure' mean reducing the vulnerability of critical infrastructure or key resources in order to deter, mitigate, or neutralize terrorist attacks." (**White House**, *HSPD-7, Critical Infrastructure Identification, Prioritization, and Protection*, December 17, 2003)

Protected Critical Infrastructure Information (PCII) Accreditation Program: "The PCII Accreditation Program was established to uphold stringent safeguards while facilitating access to vital information for homeland security professionals. Under the PCII Accreditation Program, government entities may receive access to PCII after meeting certain requirements…. Individuals in an accredited entity must complete training on proper handling and safeguarding procedures and have a need to know specific PCII in order to gain access to it." (DHS, *PCIIP Fact Sheet*)

Protected Critical Infrastructure Information (PCII) Program: "The PCII Program, part of the…DHS…is designed to encourage private industry to share its sensitive security-related business information with the Federal government. PCII is an information-protection tool that facilitates information sharing between the government and the private sector. DHS and other Federal, State and local analysts use PCII in pursuit of a more secure homeland, focusing primarily on:

Analyzing and securing critical infrastructure and protected systems,

Identifying vulnerabilities and developing risk assessments, and
Enhancing recovery preparedness measures.

Information submitted, if it satisfies the requirements of the Critical Infrastructure Information Act of 2002, is protected from public disclosure under

The Freedom of Information Act,
State and local disclosure laws, and
Use in civil litigation." (**DHS**, *Protected Critical Infrastructure Information Pgm*, 2007.

Protected Critical Infrastructure Information/Sensitive Security Information: "…an information-protection tool that facilitates information sharing between the government and the private sector, which is used by DHS and other Federal, State, and local analysts in pursuit of a more secure homeland, focusing primarily on analyzing and securing critical infrastructure and protected systems, identifying vulnerabilities and developing risk assessments, and enhancing recovery preparedness measures." (**White House**, *National Strategy for Info. Sharing*, 2007, 23)

Protection: "Dictionary definitions for 'protection' and 'protect' are: 'Protection: the act of protecting; the state of being protected…Protect: to cover or shield from exposure, injury, or destruction…' The use of 'protect' in HSPD-7 [Homeland Security Presidential Directive] is aligned with the dictionary definition in that it maintains the defensive focus…The CITF [Critical Infrastructure Task Force] believes that protection, in isolation, is a brittle strategy. We cannot protect every potential target against every conceivable attack; we will never eliminate all vulnerabilities. Furthermore, it is virtually impossible to define a desired end-state – to quantify how much protection is enough – when the goal is to reduce vulnerabilities. In contrast, a dictionary definition for 'resilience' is: 'Resilience: an ability to recover from or adjust easily to misfortune or change'." (**Critical Infrastructure Task Force, HSC,** 2006, 4)

Protection: "Protection instills a defender's view (i.e. from the inside out) and lessens the ability to see and effectively anticipate what the enemy may see looking from the outside in – what has been termed the 'predator's view'." (**Critical Infrastructure Task Force, HSC,** 2006, 15)

Protection: "Protection – the act of protecting." (**DHS**, *Critical Infrastructure Task Force Presentation to HSAC,* January 10, 2006, slide 7)

Protection: "Definition: actions or measures taken to cover or shield from exposure, injury, or destruction. "Extended Definition: includes such actions and measures needed to ensure protective reactions do not unnecessarily interfere with citizen's freedoms and liberties. "Annotation: To take defensive steps designed to provide the last line of defense to stop an attack if preventative actions are unable to preclude a terrorist or criminal operation from being initiated; to shield or safeguard; to keep from harm, injury or attack. To safeguard our people and their freedoms, critical infrastructure, property and the economy of our nation from acts of terrorism, natural disasters, or other emergencies." (**DHS**, *DHS Lexicon*, Oct. 2007, pp. 20-21)

Protection: "Actions to mitigate the overall risk to CI/KR assets, systems, networks, or their interconnecting links resulting from exposure, injury, destruction, incapacitation, or exploitation. In

the context of the NIPP, protection includes actions to deter the threat, mitigate vulnerabilities, or minimize consequences associated with a terrorist attack or other incident. Protection can include a wide range of activities, such as hardening facilities, building resiliency and redundancy, incorporating hazard resistance into initial facility design, initiating active or passive countermeasures, installing security systems, promoting workforce surety, and implementing cyber security measures, among various others." (**DHS**, *NIPP***,** 2006, p. 104)

Protection: [Note: The following definition from the *National Preparedness Guidelines* cites HSPD-7 on Critical Infrastructure as its "Source." Nothing remotely resembling the following definition is to be found in that document. Note, instead, the definition of "Protect." The "definition" below is repeated word for word, including source citation, in FEMA's November 2007 Strategic Goals document in the glossary section. Thus far the earliest usage of the wording below I have been able to find is from a "Revised Illinois Homeland Security Strategy" document dated September 30, 2005, which, under the heading of "Goal 4: Protecting Against a Major Event," contains the exact paragraph below, providing no specific citation. In that the December 2005 draft of the *National Preparedness Goal* contains the same paragraph as the definition of "Protection" I suspect that an earlier version of the NPG was the Illinois source. The December 2005 NPG also incorrectly cites HSPD-7, December 2003 as its source.]

"Actions to reduce the vulnerability of critical infrastructure or key resources in order to deter, mitigate, or neutralize terrorist attacks, major disasters, and other emergencies. It requires coordinated action on the part of Federal, State, and local governments, the private sector, and concerned citizens across the country. Protection also includes continuity of government and operations planning; awareness elevation and understanding of threats and vulnerabilities to their critical facilities, systems, and functions; identification and promotion of effective sector-specific protection practices and methodologies; and expansion of voluntary security-related information sharing among private entities within the sector as well as between government and private entities. (Source: HSPD-7, December 17, 2003). (**DHS**, *National Preparedness Guidelines*, 2007, p. 42)

Protection: "1. Preservation of the effectiveness and survivability of mission-related military and nonmilitary personnel, equipment, facilities, information, and infrastructure deployed or located within or outside the boundaries of a given operational area. 2. Measures that are taken to keep nuclear, biological, and chemical hazards from having an adverse effect on personnel, equipment, or critical assets and facilities. Protection consists of five groups of activities: hardening of positions; protecting personnel; assuming mission-oriented protective posture; using physical defense measures; and reacting to attack." (**DoD**, *DOD Dictionary of Military and Related Terms*, 2007)

Protection: "The protection function focuses on conserving the joint force's fighting potential in four primary ways — **active defensive** measures that protect the joint force, its information, its bases, necessary infrastructure, and lines of communications from an adversary's attack; **passive defensive** measures that make friendly forces, systems, and facilities difficult to locate, strike, and destroy; applying technology and procedures to reduce the risk of fratricide; and **emergency management and response** to reduce the loss of personnel and capabilities due to

accidents. It includes, but extends beyond, FP [force protection] to encompass protection of US noncombatants; the forces, systems, and civil infrastructure of friendly nations; and other government agencies, IGOs [intergovernmental organizations] and NGOs. The protection function applies domestically in the context of HD." (**DOD**, *Homeland Defense*, 2007, p. JP 3-27 (31))

Protection: "The Protection mission area includes actions to reduce the vulnerability of critical infrastructure or key resources in order to deter, mitigate, or neutralize terrorist attacks, major disasters, and other emergencies. Protection focuses on deterrence, mitigation, and *response*-oriented activities to prevent an attack from occurring, whereas prevention centers on the recognition of threats via information sharing and intelligence analysis." (**FEMA**, *Homeland Security Exercise and Evaluation Program Glossary*, 2008)

Protection: "Protection is the ability to protect critical infrastructure and key resources (CI/KR) and is vital to the national security, public health and safety, economic vitality, and way of life of the United States. It preserves life and property during a natural disaster or terrorist attacks. Protection safeguards citizens and their freedoms, critical infrastructure, property and the economy from acts of terrorism, natural disasters, or other emergencies.[107]

- Protection includes actions to mitigate the overall risk to CI/KR assets, systems, networks, functions, or their interconnecting links resulting from exposure, injury, destruction, incapacitation, or exploitation.[108] It involves actions or measures taken to cover or shield from exposure, injury, or destruction. Protective actions may occur before, during, or after an incident and are designed to prevent, minimize, or contain the impact of an incident.[109]

- Protection planning will address structures and processes that are adaptable to incorporate lessons learned and best practices and adjust quickly within the time constraints of a fast-moving crisis or threat environment. This planning should manage risk and address known and potential threats and hazards.[110]

(**FEMA**, *(Interim) Integrated Planning System (IPS) for Homeland Security (Draft Version 2.3)*, July 3, 2008 copy, pp. 2-6 through 2-7)

Protection: "Protection includes all activities to identify CI/KR, assess vulnerabilities, prioritize CI/KR, and develop protective programs and measures, since these activities lead to the final act of implementing such protective strategies to reduce vulnerability. **Protective actions** include detection mechanisms or programs (e.g. surveillance systems that indicate a potential threat), deterrence actions (e.g., enhanced security that reduces the aggressor's likelihood of success and interest in the target); defensive actions (e.g., physical hardening or buffer zones, that prevent or delay an attack); and actions that reduce the value or incentive to an aggressor to attack (e.g., creating redundancies in a system and recovery programs that minimize consequences). Strategies for response and recovery are also important." (**NIST**, "CIP Instructions," June 2004)

[108] National Infrastructure Protection Plan (NIPP), 2006.
[109] DHS Lexicon Terms and Definitions, Approved October 23, 2007.
[110] National Infrastructure Protection Plan, 2006.

Protection: "(e) Protection. The Office [Homeland Security] shall coordinate efforts to protect the United States and its critical infrastructure from the consequences of terrorist attacks. In performing this function, the Office shall work with Federal, State, and local agencies, and private entities, as appropriate, to:

(i) strengthen measures for protecting energy production, transmission, and distribution services and critical facilities; other utilities; telecommunications; facilities that produce, use, store, or dispose of nuclear material; and other critical infrastructure services and critical facilities within the United States from terrorist attack;

(ii) coordinate efforts to protect critical public and privately owned information systems within the United States from terrorist attack;

(iii) develop criteria for reviewing whether appropriate security measures are in place at major public and privately owned facilities within the United States;

(iv) coordinate domestic efforts to ensure that special events determined by appropriate senior officials to have national significance are protected from terrorist attack;

(v) coordinate efforts to protect transportation systems within the United States, including railways, highways, shipping, ports and waterways, and airports and civilian aircraft, from terrorist attack;

(vi) coordinate efforts to protect United States livestock, agriculture, and systems for the provision of water and food for human use and consumption from terrorist attack; and

(vii) coordinate efforts to prevent unauthorized access to, development of, and unlawful importation into the United States of, chemical, biological, radiological, nuclear, explosive, or other related materials that have the potential to be used in terrorist attacks." (**White House**, *EO 13228, Establishing Office of Homeland Security*, October 8, 2001)

Protection of Radio Stations Program: "A fallout shelter program for selected radio stations was started in fiscal year 1962. The purpose of this program is to enable these stations to operate in a radioactive fallout environment in disseminating official information during a postattack period." (**OCD**, *Annual Report 1962*, p. 35)

Protective Action: "Definition: step taken before, during, or after an incident designed to prevent, minimize, or contain impact of incident

"Extended Definition: methods for selecting the best actions within the time constraints of a fast-moving emergency; measures describe preparations taken before an emergency situation to ensure implementation is possible during an emergency; includes decision-making and implementation issues to rapidly reduce the effects of an emergency situation or contamination

"Annotation: Protective action involves actions taken to protect lives and property. It involves applying intelligence and other information to a range of activities that may include such countermeasures as deterrence operations; heightened inspections; improved surveillance and security operations; investigations to determine the full nature and source of the threat; public

health and agricultural surveillance and testing processes; immunizations, isolation, or quarantine; and, as appropriate, specific law enforcement operations aimed at deterring, preempting, interdicting, or disrupting illegal activity and apprehending potential perpetrators and bringing them to justice." (**DHS,** *Lexicon: Terms and Definitions*, October 19, 2007, p. 21)

Protective Action Guide (PAG): "The projected dose to reference man, or other defined individual, from an accidental release of radioactive material at which a specific protective action to reduce or avoid that dose is warranted." (**EPA**, *Manual of Protective Action Guides and Protective Actions For Nuclear Incidents*, 1991, p. A. 3, Glossary)

Protective Action Implementation: "Definition: Guard the public from potentially hazardous effects of an emergency, including evacuation, shelter-in-place and isolation." (**DHS**, *Universal Task List 2.1*, 2005, p. 80)

Protective Action Zone: "The **Protective Action Zone** defines an area DOWNWIND from the incident in which persons may become incapacitated and unable to take protective action and/or incur serious or irreversible health effects. The Table provides specific guidance for small and large spills occurring day or night." (**DOT**, *Emergency Response Guidebook*, 2004, p. 295)

Protective Actions: "Protective Actions are those steps taken to preserve the health and safety of emergency responders and the public during an incident involving releases of dangerous goods.." (**DOT**, *Emergency Response Guidebook*, 2004, p. 298)

Protective Measures Target List (PMTL): "RMD [Risk Management Division] derived the initial 1,849 BZPP [Buffer Zone Protection Program] sites from the Protective Measures Target List developed by DHS at the request of Congress in 2003." (**DHS/OIG**, *Review of the Buffer Zone Protection Program*, July 2007, p. 6)

Protective Security Advisor (PSA): "…the Department's [DHS] infrastructure protection work is not performed only in Washington, DC; rather, it takes place across the country via the Protective Security Advisor (PSA) cadre. PSAs are in place in communities throughout the Nation to assist with local efforts to protect critical assets, providing a Federal resource to communities and businesses. During natural disasters and contingency events, PSAs work in State and local Emergency Operations Centers. PSAs also provide real-time information on facility significance and protective measures to facility owners and operators, as well as State and local representatives. Typically, PSAs are engaged to support the planning and execution of National Special Security Events (NSSEs), led by the U.S. Secret Service, as well as non-NSSEs, led by the Department's Office of Operations Coordination and Planning…" (**DHS**, *Statement for the Record, Robert B. Stephan, Assistant Secretary, Infrastructure Protection, National Protection and Programs Directorate…, before the Committee on Homeland Security*, July 9, 2008, page 3)

PTE: Potential Threat Element. (**DHS**, *Intelligence and Information Sharing Initiative* (Final Report), December 2004, slide 29)

PTEE PCC: Plans, Training, Exercises and Evaluations Policy Coordination Committee, HSC. (**OMB**, *Detailed Information on FEMA Grants and Training Office NEP Assessment,* 2007)

Public Assistance Coordinator (PAC): "The Public Assistance Coordinator is a subsection of the Public Assistance Team (PAT). The PAC is assigned to work with a Public Assistance (PA)

applicant from declaration to funding approval." (**FEMA**, *Typed Resource Definitions: Incident Management Resources* (FEMA 508-2), p. 29)

Public Assistance (PA) Program, FEMA Disaster Relief: "Supplementary Federal assistance provided pursuant to a Presidential Declaration of emergency or major disaster under the Stafford Act to State and local governments or certain private, not-for-profit organizations other than assistance for the direct benefit of individuals and families." (**FEMA**/EMI 1996) "FEMA's public *assistance program is typically the largest source of disaster relief." (***GAO***, Disaster Assistance: Federal Aid to the New York City Area Following the Attacks of September 11,*th 2003, p. 5)

Public Assistance (PA) Program, FEMA Disaster Relief: "Under a major disaster declaration, Public Assistance may be approved to fund a variety of projects, including:

- Debris clearance, when in the public interest, on public or private lands or waters.
- Emergency protective measures for the preservation of life and property.
- Repair or replacement of public roads, streets, and bridges.
- Repair or replacement of public water control facilities (dikes, levees, irrigation works, and drainage facilities).
- Repair or replacement of public buildings, utilities, and related equipment.
- Repair or restoration of public recreational facilities and parks." (**FEMA**, *Disaster Basics* (IS-292), May 24, 2007 update, p. A-9, Glossary)

Public Assistance (PA) Program, FEMA Disaster Relief: "Under the PA Program, which is authorized by the Stafford Act, FEMA awards grants to assist State and local governments and certain Private Nonprofit (PNP) entities with the response to and recovery from disasters. Specifically, the program provides assistance for debris removal, emergency protective measures, and permanent restoration of infrastructure. The Federal share of these expenses typically cannot be less than 75 percent of eligible costs. The program also encourages protection from future damage by providing assistance for hazard mitigation measures during the recovery process. The PA Program encourages planning for disaster recovery, but PA Program funds may not be used for the costs of planning. The costs incurred implementing the plans are eligible for reimbursement only if they meet PA Program eligibility criteria. The PA Program is based on a partnership of FEMA, State, and local officials.

"FEMA is responsible for managing the program, approving grants, and providing technical assistance to the State and applicants.

"The State, in most cases, acts as the Grantee for the PA Program. FEMA, the State, and the Applicant are all responsible for grants awarded under the PA program. The State educates potential applicants, works with FEMA to manage the program, and is responsible for

implementing and monitoring the grants awarded under the program. In some instances, the State may take a more active role in overall management of certain disasters, as discussed later in this chapter under State Management of Disasters. Some State regulations prohibit the State from acting as Grantee for an Indian Tribe. In such cases, or upon the Tribe's choice, a Tribal government may act as its own Grantee.

"Local officials are responsible for identifying damage, providing sufficient data for FEMA to develop an accurate scope and cost estimate for doing the work and approving grants, and managing the projects funded under the PA Program.

"The PA Program staff consists of management and field personnel who assist the applicant during the recovery process. These staff members include a Public Assistance Group Supervisor (Public Assistance Officer), Public Assistance Coordination Crew Leader (Public Assistance Coordinator), Public Assistance Project Specialist (Project Officer), and Public Assistance Technical Specialists (Specialists)." (**FEMA**, *Public Assistance Program* (FEMA 322), 2007)

Public Assistance (PA) Program, FEMA Disaster Relief, PA Group Supervisor: "The PA Program is managed at the JFO [Joint Field Office] by the PA Group Supervisor. As the program manager, the PA Group Supervisor advises the FCO [Federal Coordinating Officer] on all PA Program matters; manages the operation of PA Program staff and any coordination between the PA Program and other arms of the Federal disaster recovery effort; works with State counterparts; and ensures that the PA Program is operating in compliance with all laws, regulations, and policies." (**FEMA**, *Public Assistance Program* (FEMA 322), June 2007)

Public Assistance (PA) Program, FEMA Disaster Relief, PA Coordination (PAC) Crew Leader: "At the beginning of the disaster recovery process, FEMA, in coordination with the State, assigns a PAC Crew Leader to each applicant. The PAC Crew Leader is a customer service manager who works with the applicant to resolve disaster-related needs and ensure that the applicant's projects are processed as efficiently and expeditiously as possible. By being involved from the declaration to the obligation of funds, the PAC Crew Leader ensures continuity of service throughout the delivery of the PA Program. A PAC Crew Leader generally has responsibility for more than one applicant." (**FEMA**, *Public Assistance Program*, 2007)

Public Assistance (PA) Program, FEMA Disaster Relief, PA Project Specialists and Technical Specialists: "Project and Technical Specialists are resources for the applicant. Typically, Project Specialists are responsible for assisting with the development of projects and cost estimates. While a Project Specialist is generally knowledgeable with regard to the PA Program, a Technical Specialist usually has a defined area of expertise that a Project Specialist may call upon in the development of a specific project. Technical Specialists assigned to a JFO may have experience in such areas as roads and bridges, utility infrastructure, debris removal and disposal, environmental and historic preservation compliance, insurance, and cost estimating." (**FEMA**, *Public Assistance Program* (FEMA 322), June 2007)

Public Awareness: "The process of informing the community as to the nature of the hazard and actions needed to save lives and property prior to and in the event of disaster." (**UNDHA**, *DM Glossary*, 1992, 60)

Public Disaster Communications: FEMA program. "…nearly $1 million will be set aside for Public Disaster Communications. FEMA will assume a leadership position as coordinator of all hazards messaging to the American public during peacetime and disasters, leading the national campaign for greater personal and community preparedness. Specifically, the funding requested will support FEMA's efforts to strengthen interagency incident communications systems and capabilities to ensure coordinated public information efforts across all hazards. By working one-on-one with State, local, and major urban area jurisdictions to build knowledge and capability for public information efforts and conducting planning, training, and exercises to ensure integrated crisis communication strategies and messaging FEMA will facilitate public discourse, outreach, and adoption of a national culture of personal preparedness and mitigation that will have a direct impact on reducing the loss of life and property. Through effective public communications and outreach programs, FEMA will ensure the general public is provided with and has access to vital disaster preparedness and planning information including those with special needs and multilingual and multicultural populations." (**FEMA**, *Opening Statement of Paulison, House Appropriations HS Subcommittee*, March 9, 2007, p. 17)

Public Education: "Public education is the process of making the public aware of risks and how they can prepare for all hazards in advance…. Public education may be accomplished through events (safety fairs) or products such as media releases or packets and the distribution of brochures. Examples of public education campaigns include:

- hurricane preparedness;
- personal preparedness and developing family or business emergency plans;
- hazardous materials awareness;
- tornado and severe weather awareness; and
- special needs population awareness." (**FEMA**, *FEMA 517*, Nov 2007, 4)

Public Education: See Citizen Disaster Education.

Public Facility: "`Public facility' means the following facilities owned by a State or local government: (A) Any flood control, navigation, irrigation, reclamation, public power, sewage treatment and collection, water supply and distribution, watershed development, or airport facility. (B) Any non-Federal-aid street, road, or highway. (C) Any other public building, structure, or system, including those used for educational, recreational, or cultural purposes. (D) Any park." (**Stafford Act**, June 2006 (FEMA 592), p, 15)

Public Health: "…the committee adopted the definition of public health from the landmark 1988 IOM [Institutes of Medicine] report *The Future of Public Health*, which defined public health as "what we, as a society, do collectively to assure the conditions in which people can be healthy" (IOM, 1988, p. 1)." (**Altevogt**, et al. (Editors). *Research Priorities in Emergency Preparedness and Response for Public Health Systems: A Letter Report*, Jan 2008, 10)

Public Health (PH): "Individuals who prevent epidemics and the spread of disease, protect against environmental hazards, promote healthy behaviors, respond to disasters and assist in recovery, as well as assure the quality and accessibility of health services." (**FEMA**, *TIE/TO Course Catalog*, 2008, p. 3)

Public Health: "The term 'public health' means the science and practice of protecting and improving the overall health of the community through disease prevention and early diagnosis, control of communicable diseases, health education, injury prevention, sanitation, and protection from environmental hazards." (**White House**, *HSPD 21*, October 18, 2001)

Public Health and Medical Preparedness: "The term 'public health and medical preparedness' means the existence of plans, procedures, policies, training, and equipment necessary to maximize the ability to prevent, respond to, and recover from major events, including efforts that result in the capability to render an appropriate public health and medical response that will mitigate the effects of illness and injury, limit morbidity and mortality to the maximum extent possible, and sustain societal, economic, and political infrastructure." (**White House**, *HSPD 21*, October 18, 2001)

Public Health and Medical Preparedness Critical Components: "…the four most critical components of public health and medical preparedness are

- biosurveillance,
- countermeasure distribution,
- mass casualty care, and
- community resilience.

Although those capabilities do not address all public health and medical preparedness requirements, they currently hold the greatest potential for mitigating illness and death and therefore will receive the highest priority in our public health and medical preparedness efforts. Those capabilities constitute the focus and major objectives of this Strategy." (**White House**, *HSPD 21*, October 18, 2001)

Public Health and Medical Preparedness Principles: "This Strategy draws key principles from the *National Strategy for Homeland Security* (October 2007), the *National Strategy to Combat Weapons of Mass Destruction* (December 2002), and *Biodefense for the 21st Century* (April 2004) that can be generally applied to public health and medical preparedness. Those key principles are the following:
(1) preparedness for all potential catastrophic health events;
(2) vertical and horizontal coordination across levels of government, jurisdictions, and disciplines;
(3) a regional approach to health preparedness;
(4) engagement of the private sector, academia, and other nongovernmental entities in preparedness and response efforts; and
(5) the important roles of individuals, families, and communities." (**WH**, *HSPD 21*, 18Oct2001)

Public Health Emergency: "`Public health emergencies' have been defined by Burkle (2007)[111] as those `that adversely impact the public health system and/or its protective

[111] Burkle, F. M., Jr. 2007. "Public health emergencies, cancer, and the legacy of Katrina." *Prehospital Disaster Medicine*, Vol. 22, No. 4, pp. 291–292.

infrastructure (i.e., water, sanitation, shelter, food, and health), resulting in both direct and indirect consequences to
the health of a population, and occur when this protective threshold is absent, destroyed, overwhelmed, not recovered or maintained, or denied to populations'." (Quoted in **Altevogt**, et al. (Editors). *Research Priorities in Emergency Preparedness and Response for Public Health Systems: A Letter Report*, Jan 2008, 13)

Public Health Emergency: "Defined by the *Model State Emergency Health Powers Act* (MSEHPA): An occurrence or imminent threat of an illness or health condition that is believed to be caused by: (1) bioterrorism; (2) the appearance of a novel or previously controlled or eradicated infectious agent or biological toxin; (3) a natural disaster; (4) a chemical attack or accidental release; or (5) a nuclear attack or accident. It must pose a high probability of a large number of deaths in the affected population, or a large number of serious or long-term disabilities in the affected population, or widespread exposure to an infectious or toxic agent that poses a significant risk of substantial future harm to a large number of people in the affected population." (**HHS**, *Medical Surge Capacity and Capability Handbook*, August 2004, p. D-10)

Public Health Emergency Medical Countermeasures Enterprise (PHEMC), HHS: "The HHS Public Health Emergency Medical Countermeasures Enterprise (HHS PHEMCE) leads the mission to develop and acquire medical countermeasures that will improve public health emergency preparedness as well as prevent and mitigate the adverse health consequences associated with CBRN and naturally occurring threats. HHS PHEMCE is a coordinated, intra-agency effort led by the Office of the Assistant Secretary for Preparedness and Response (ASPR) and includes three HHS internal agencies: the Centers for Disease Control and Prevention (CDC), the Food and Drug Administration (FDA), and the National Institutes of Health (NIH). Additionally, HHS PHEMCE collaborates with its *ex officio* members: the Department of Defense (DOD), the Department of Homeland Security (DHS), the Department of Veterans Affairs (VA) and other interagency stakeholders as appropriate." (**HHS**, *PHEMC Implementation Plan for CBRN Threats*, April 2007, p. 2)

Public Health Emergency Medical Countermeasures Enterprise (PHEMC), HHS, Implementation Plan for CBRN Threats: "The *HHS PHEMCE Implementation Plan for CBRN Threats* addresses twelve biological threat agents, a class of chemical threats (volatile nerve agents) and radiological and nuclear threats…. The *HHS PHEMCE Implementation Plan for CBRN Threats* excludes pandemic influenza, which is addressed in the *HHS Pandemic Influenza Plan….*" (**HHS**, *PHEMC Implementation Plan for CBRN Threats*, April 2007, p. 2)

Public Health Emergency Medical Countermeasures Enterprise (PHEMCE), HHS Strategic Plan for CBRN Threats: "The *HHS PHEMCE Strategy*, published in the *Federal Register* on March 20, 2007, described a framework of strategic policy goals and objectives for identifying medical countermeasure requirements and establishing priorities for medical countermeasure evaluation, development and acquisition. These strategic policy goals and objectives were used to establish the Four Pillars upon which this *HHS Public Health Emergency Medical Countermeasures Enterprise Implementation Plan* (*HHS PHEMCE Implementation Plan*) is based….

- **Pillar One: Identify and assess CBRN threats.**
- **Pillar Two: Assess medical/public health consequences.**
- **Pillar Three: Establish medical countermeasure requirements that incorporate assessments of current levels of preparedness, concepts of utilization, and product specifications.**
- **Pillar Four: Identify and prioritize near-, mid-, and long-term development and acquisition programs informed by assessment of the maturity of the product development pipeline and estimated costs. (HHS**, *PHEMCE Implementation Plan*, 2007, p. 6)

Public Health Emergency Preparedness: "Public health emergency preparedness (PHEP) is the capability of the public health and health-care systems, communities, and individuals to prevent, protect against, quickly respond to, and recover from health emergencies, particularly those whose scale, timing, or unpredictability threatens to overwhelm routine capabilities. Preparedness involves a coordinated and continuous process of planning and implementation that relies on measuring performance and taking corrective action." (Nelson et al, *American Journal of Public Health*, 2007, p. S9; Adopted by Altevogt, *Research Priorities in EP&R…*, Jan2008, 9.

Public Health Emergency Preparedness Cooperative Agreement, CDC, HHS: "The purpose of the Division of State and Local Readiness' cooperative agreement program is to upgrade and integrate State and local public health jurisdictions' preparedness for and response to terrorism and other public health emergencies with Federal, State, local, and tribal governments, the private sector, and Non-Governmental Organizations (NGOs). These emergency preparedness and response efforts are intended to support the NRP and NIMS. Activities included in the cooperative agreement are designed to develop emergency-ready public health departments." (**DHS/ODP**, *FY 2006 EMPG Program Guidance*, November 2005, p. 11)

Public Health Information Network: "The CDC Public Health Information Network (PHIN) is a national initiative to improve the capacity of public health to use and exchange information electronically by promoting the use of standards, defining functional and technical requirements. PHIN strives to improve public health by enhancing research and practice through best practices related to efficient, effective, and interoperable public health information systems." (**CDC**, *Detailed Definition of PHIN*, Accessed November 17, 2007)

Public Health Infrastructure: "Public health infrastructure refers to essential public health services, including the people who work in the field of public health, information and communication systems used to collect and disseminate accurate data, and public health organizations at the state and local levels." (**CDC**, *The Laboratory Response Network*, 2005)

Public Health Preparedness, Key Elements: "A prepared community is one that develops, maintains, and uses a realistic preparedness plan that is integrated with routine practices and has the following components:
Preplanned and coordinated rapid-response capability
1. *Health risk assessment.* Identify the hazards and vulnerabilities (e.g., community health assessment, populations at risk, high-hazard industries, physical structures of importance) that will form the basis of planning.

2. *Legal climate*. Identify and address issues concerning legal authority and liability barriers to effectively monitor, prevent, or respond to a public health emergency.
3. *Roles and responsibilities*. Clearly define, assign, and test responsibilities in all sectors, at all levels of government, and with all individuals, and ensure each group's integration.
4. *Incident Command System (ICS).* Develop, test, and improve decision making and response capability using an integrated ICS at all response levels.
5. *Public engagement*. Educate, engage, and mobilize the public to be full and active participants in public health emergency preparedness.
6. *Epidemiology functions*. Maintain and improve the systems to monitor, detect, and investigate potential hazards, particularly those that are environmental, radiological, toxic, or infectious.
7. *Laboratory functions*. Maintain and improve the systems to test for potential hazards, particularly those that are environmental, radiological, toxic, or infectious.
8. *Countermeasures and mitigation strategies*. Develop, test, and improve community mitigation strategies (e.g., isolation and quarantine, social distancing) and countermeasure distribution strategies when appropriate.
9. *Mass health-care*. Develop, test, and improve the capability to provide mass health-care services.
10. *Public information and communication*. Develop, practice, and improve the capability to rapidly provide accurate and credible information to the public in culturally appropriate ways.
11. *Robust supply chain.* Identify critical resources for public health emergency response and practice and improve the ability to deliver these resources throughout the supply chain.
Expert and fully staffed workforce
1. *Operations-ready workers and volunteers*. Develop and maintain a public health and health-care workforce that has the skills and capabilities to perform optimally in a public health emergency.
2. *Leadership*. Train, recruit, and develop public health leaders (e.g., to mobilize resources, engage the community, develop interagency relationships, and communicate with the public).
Accountability and quality improvement
1. *Testing operational capabilities.* Practice, review, report on, and improve public health emergency preparedness by regularly using real public health events, supplemented with drills and exercises when appropriate.
2. *Performance management.* Implement a performance management and accountability system.
3. *Financial tracking.* Develop, test, and improve charge capture, accounting, and other financial systems to track resources and ensure adequate and timely reimbursement." (**Nelson** et al, *American Journal of Public Health*, 2007, p. S10; in **Altevogt**, *Research Priorities in EP&R…*, Jan 2008, pp. 11-12)

Public Health Security and Bioterrorism Preparedness and Response Act of 2002 (Bioterrorism Act): "Public Law 107-188, 42 U.S.C. 247d and 300hh, June 12, 2002, is designed to improve the ability of the United States to prevent, prepare for, and respond to bioterrorism and other public health emergencies. Key provisions of the act address the development of a national preparedness plan designed to provide effective assistance to State and local governments in the event of bioterrorism or other public health emergencies; operation of the National Disaster Medical System to mobilize and respond to public health emergencies; grant programs for the education and training of public health professionals and improving State, local, and hospital preparedness for and response to bioterrorism and other public health

emergencies; streamlining and clarifying communicable disease quarantine provisions; enhancing controls on dangerous biological agents and toxins; and protecting the safety and security of food and drug supplies." (**DHS**, *National Response Plan* (Draft #1), February 25, 2004, p. 68) [This Act can be accessed at: http://www.fda.gov/oc/bioterrorism/bioact.html]

Public Health Service Act: "The Public Health Service Act provides a general grant of authority for Federal-State cooperation and authorizes the Secretary of Health and Human Services to develop and take such action as may be necessary to implement a plan under which the personnel. Equipment, medical supplies and other resources of the Service and other agencies under the jurisdiction of the Secretary may be effectively used to control epidemics of any disease or condition and to meet other health emergencies and problems, 42 U.S.C. 243. The Secretary is further empowered to extend temporary assistance to States or localities to meet health emergencies. During an emergency proclaimed by the President, the President has broad authority to direct the services of the Public Health Service, see 42 U.S.C. 217. Under that section, the President is authorized to "utilize the [Public Health] Service to such extent and in such manner as shall in his judgment promote the public interest." Additionally, under 42 U.S.C. 264, the Surgeon General is authorized to make and enforce quarantine regulations "necessary to prevent the introduction, transmission, or spread of communicable diseases" from foreign countries into the states or possessions, or from one state or possession to another. The diseases for which a person may be subject to quarantine must be specified by the President through an Executive Order." (**DHS**, *National Response Plan* (Draft #1), February 25, 2004, p.71)

Public Health System: "The 2002 IOM [Institute of Medicine] report *The Future of the Public's Health in the 21st Century* describes the concept of a "public health system" as "a complex network of individuals and organizations that have the potential to play critical roles in creating the conditions for health" (IOM, 2002, p. 28). It also lists various factors in a public health system, and explains that they can both act individually and together to affect health… factors, which include communities, health-care delivery systems, employers and business, the media, homeland security and public safety, academia, and the governmental public health infrastructure." (**Altevogt**, Bruce M., et al. (Editors). *Research Priorities in Emergency Preparedness and Response for Public Health Systems: A Letter Report*, January 2008, p. 10)

Public Information: "The term "public information" refers to any text, voice, video, or other information provided by an authorized official and includes both general information and crisis and emergency risk communication (CERC) activities. CERC incorporates the urgency of disaster communication with risk communication to influence behavior and adherence to directives." (**DHS**, *TCL*, 2007, p. 421)

Public Information Officer (PIO): "The PIO is responsible for communicating with the public, media, and/or coordinating with other agencies, as necessary, with incident related information requirements. The PIO is responsible for developing and releasing information about the incident to the news media, incident personnel, and other appropriate agencies and organizations. Depending on the size or complexity of the incident, a lead PIO should be assigned for each incident and may have assistants, as necessary, including supporting PIOs representing other responding agencies or jurisdictions." (**FEMA**, *FEMA 517*, Nov 2007, p. 2)

Public Information Planning: "Public information efforts should begin well in advance of an incident or planned event and may involve a combination of planning, resource gathering, organizing, and training and exercises. Public information planning allows for lifesaving measures such as evacuation routes, alert systems, and other public safety information, to be coordinated and communicated to diverse audiences in a timely, consistent manner. Public education contributes to preparing citizens to respond to a variety of hazards." (**FEMA**, *FEMA 517*, Nov 2007, p. 4)

Public Information Preparedness: "Public information preparedness includes developing and maintaining plans and procedures, checklists, contact lists, and public information materials. Below are some factors a PIO should consider when developing or planning prior to an incident or planned event." (**FEMA**, *FEMA 517*, Nov 2007, 4)

Public Law 80-253: *National Security Act of 1947.*

Public Law 81-516: *Flood Control Act of 1950.*

Public Law 81-774: *Defense Production Act of 1950.*

Public Law 81-875: *Federal Disaster Act of 1950*.

Public Law 81-920: *Federal Civil Defense Act of 1950*, 12Jan1951. Repealed 1994, by PL 103-337.

Public Law 83-115: *Drought Relief.* "The 83rd Congress, 1st session…enacted Publi Law 115 in order to provide assistance by the Department of Agriculture in agricultural areas affected by drought. This action amends Publi Law 38, 81st Congress, and provides that Public Law 875 must be invoked prior to assistance being provided by the Department under sections 2 (b) and (d) of Public Law 38. Section 2 (b) of Public Law 38, as amended by Public Law 115, provides loan assistance by the Department of Agriculture in areas declared 'major disaster' by the President under authority of Public Law 875…." (**FCDA**, *1953 Annual Report*, p. 22)

Public Law 83-134: *Surplus Property*. Amended section 3 (c) of Public Law 81-875 "by rpoviding for the donation or loan of surplus Federal equipment and supplies to States for use or distibution by them under Public Law 875. Such property may be used to restore public facilities damaged or destroyed in major disaster and to rehabilitate persons in need as the result of such disaster. There is no financial outlay from Public Law 875 funds to provide such surplus. All costs must be borne by the State…" (**FCDA**, *1953 Annual Report*, p. 21)

Public Law 84-99: *Flood Control and Coastal Emergency Act, as amended*.

Public Law 84-655: *Federal Property and Administrative Services Act* "Federal surplus property became available for civil defense purposes in July 1956, when an amendment to the Federal Property and Administrative Services Act was approved." (**FCDA**, *1957 Annual Report*, 64)

Public Law 84-1016, *Federal Flood Insurance Act of 1956.* "Besides providing protection from flood loss, the law requires a study and report on insurance needs against other natural desaster perils." (**FCDA**, *1956 Annual Report*, 1957, pp. 35 & 37)

Public Law 85-606 (August 8, 1958): Amends the Federal Civil Defense Act of 1950, changing responsibilities for civil defense from primarily State and local government responsibilities to joint responsibilities of the Federal government in partnership with State and local government, and expanding the program of Federal financial assistance as well as providing for the distribution of radiological defense instruments to State and local units. (**Gessert**, *Federal Civil Defense Organization*, 1965, p. 71)

Public Law 93-288: *Robert T. Stafford Disaster Relief and Emergency Assistance Act of 1988.*

Public Law 95-124: *Earthquake Hazards Reduction Act of 1977.*

Public Law 99-149, as amended: *Superfund Amendments and Reauthorization Act of 1986.*

Public Law 99-198: *The Food Security Act of 1985.*

Public Law 101-380 (104 Stat. 484): *Oil Pollution Act of 1990.*

Public Law 103-337: *National Defense Authorization Act for Fiscal Year 1995*. (Title XXXIV – Civil Defense – Sec. 3411. "Restatement of Federal Civil Defense Authorities in the Robert T. Stafford Disaster Relief and Emergency Assistance Act." [Abolished Federal CD Act of 1950 and incorporated selected provisions into the Stafford Act.]

Public Law 103-191: *Health Insurance Portability and Accountability Act of 1996* (HIPPA).

Public Law 103-325: *National Flood Insurance Reform Act of 1994*. (**FEMA**, NFIRA)

Public Law 104-201, Title XIV: *Defense Against Weapons of Mass Destruction Act of 1996*.

Public Law 106-390: *Disaster Mitigation Act of 2000*. (**U.S. Congress**, October 30, 2000)

Public Law 107-56: *Uniting and Strengthening America By Providing Appropriate Tools Required to Intercept and Obstruct Terrorism (USA Patriot Act) Act of 2001*. October 26, 2001

Public Law 107-188: *Public Health Security and Bioterrorism Preparedness and Response Act of 2002*. June 12, 2002.

Public Law 107-197: *Terrorist Bombings Convention Implementation Act of 2002*. 25Jun2002.

Public Law 107-295 (116Stat.2064)**:** *Maritime Transportation Security Act of 2002* (MTSA).

Public Law 107-296, as amended: *Homeland Security Act of 2002* (November 25, 2002).

Public Law 107-310: *The Dam Safety and Security Act of 2002.*

Public Law 107-314. *Bob Stump National Defense Authorization Act for Fiscal Year 2003*. (U.S. Congress, December 2, 2002)

Public Law 108-7: *Consolidated Appropriations Resolution, 2003*.

Public Law 108-20: *Smallpox Emergency Personnel Protection Act of 2003*. (**U.S. Congress**)

Public Law 108-264: *The Bunning-Bereuter-Blumenauer Flood Insurance Reform Act of 2004*.

Public Law 108-276: *Project BioShield Act of 2004.*

Public Law 108-458: *Intelligence Reform and Terrorism Prevention Act of 2004*.

Public Law 109-59: *Safe, Accountable, Flexible, Efficient Transportation Equity Act; A Legacy for Users* (SAFETEA-LU), 2005.

Public Law 109-295: *DHS Appropriations Act for 2007*, October 4, 2007.

Public Law 109-295 (Title VI): *Post-Katrina Emergency Management Reform Act of 2006.*

Public Law 109-347: *Security and Accountability Act for Every (SAFE) Port Act of 2006*.

Public Law 109-364: *John Warner National Defense Authorization Act.* 2006.

Public Law 109-417 (December 2006): *The Pandemic and All-Hazards Preparedness Act.*

Public Law 110-53 (August 3, 1007): *Implementing Recommendations of the 9/11 Commission Act of 2007*. (**Library of Congress**, Thomas)

Public Law 110-114. *Water Resources Development Act of 2007*.

Public Law 110-181: *National Defense Authorization Act of 2008*. At paragraph 1068 repealed P.L. 109-364 paragraph 1076 giving the President greater authority vis-vis State Governors in disaster respone incident management.

Public-Private Sector Partnerships: "Public-private partnerships should be expanded to pursue three opportunities:

1. Access private sector assets to support response. Hurricane Katrina demonstrated that public sector emergency response capacity can be overwhelmed by large-scale catastrophes. In the Gulf States, local, state and federal government resources were not sufficient to respond to immediate needs, but effective partnerships with the private sector were lacking. Private-sector distribution of essential goods was slowed because sufficient protocols and contingency plans had not been established prior to the disaster. To bolster response capacity, public officials and private sector

leaders have called for states and local agencies to improve public-private partnerships to supplement public sector responses. To bolster state and local response capacity, the State must explore opportunities to collaborate with the private sector and leverage private sector assets for preparedness.

2. Tap private sector expertise to support preparedness. Hurricane Katrina also demonstrated that the public sector has not adopted state-of-the-art supply chain management and other strategies which could speed response. Moreover, private sector expertise in management strategies, communications, networking and other areas could further enhance public sector capacity. To ensure that emergency managers and responders are armed with cutting-edge expertise necessary to ensure quick response, the State must tap the continuously evolving knowledge of the private sector.

3. Leverage market opportunities to support preparedness. The federal government and some states have called for market-based strategies to bolster preparedness. Strategies proposed include catastrophic insurance plans and savings accounts. While some communities have put in place market-based incentives for preparedness, the State has not aggressively pursued these or other strategies – including performance-based building codes that can create incentives for buildings that exceed minimum construction standards, tax and regulatory incentives, or independent certifications of preparedness. To fully leverage the potential of private sector collaboration, the State must promote market strategies to improve household, business and public sector preparedness." (**Little Hoover Com**., *Safeguarding the Golden State*, 2006, 40)

Public Safety Communications (PSC): "Individuals who, on a full-time, part-time, or voluntary basis, through technology, serve as a conduit and put persons reporting an incident in touch with response personnel and emergency management, in order to identify an incident occurrence and help support the resolution of life-safety, criminal, environmental, and facilities problems associated with the event." (**FEMA**, *TEI/TO Course Catalog*, 2008, 3)

Public Safety Foundation of America (PSFA): "The PSFA, a 501(c)(3) charitable organization, was established in January 2002 by the Association of Public-Safety Communications Officials International (APCO). The PSFA's objective is to provide critical funding and technical support to public safety answering points (PSAPs) and local emergency response officials." (**PSFA**, *About the PSFA*, 2007)

Public Safety Interoperable Communications Grant Program (PSIC) DHS. See, also, Department of Homeland Security, PSIC.

Public Sector: "A particular element or component of government, i.e. police, fire, emergency services, public works, local, state, or federal government entity. (**Jones**, *Critical Incident* Protocol, 2000, 37)

Public Transportation Security Grants Program (TSGP): "…provides grant funding to support mass transit agencies within the Nation's key highthreat urban areas in their efforts to enhance security measures for critical transit infrastructure including bus, rail and ferry systems. This program also provides funding to Amtrak for continued security enhancements for intercity rail operations between key, high-risk urban areas throughout the United States. A risk-based

approach is used to allocate TSGP funding to eligible mass transit and intra-city bus systems on a regional basis to address priorities identified in the National Preparedness Guidelines, the NIPP and the National Strategy for Transportation Security (NSTS), with particular focus on high-risk and high consequence transit systems." (FEMA, *Statement of R. David Paulison, Administrator, on the Fiscal Year 2009 President's Budget Before the Committee on Appropriations Subcommittee on Homeland Security, U.S. House of Representatives*, March 11, 2008, p. 5)

Public Warning: "Timely and effective public warnings can save lives, reduce property losses and speed economic recovery. Public warning empowers citizens by providing them with the information they need during times of emergency to make informed decisions. The objective of a public warning system is to capture the attention of people at risk, to provide them with relevant and accurate information regarding the nature of the threat and to provide such information in time for protective actions to be taken. A truly effective public warning capability will reach those at risk regardless of their location, the time of day or night or any disabilities or special needs." (**Partnership for Public Warning**, *Protecting America's Communities*, 2004, p. 3)

Public Warning Issues – To Warn Or Not: "Officials are sometimes reluctant to communicate information to the public until the situation becomes clearer, out of a fear that public knowledge may make things worse. Experience and research show that when there is a credible threat, it is better to get information to people who can do something about it rather than to withhold it. Opening up an ongoing information flow as incident unfolds -- literally telling the story of the emergency as new facts disclose themselves -- allows initial directives to be modified as circumstances change. No one would expect directives for protective action to remain static when the emergency itself does not remain static. The public will listen to the emergency story unfold and will modify their actions as facts become clear and situations change. In many after action reviews of major emergencies, the economic, political and moral costs and liabilities of not providing information when it could have been released are often assessed as being very high. (**PPW**, *Protecting America's Communities,* 2004, 8)

Public Warning Issues – Too Much Information: "The Too-Much Information Myth:
If information is accurate, it is impossible to give the public too much information that applies directly to their safety. Warning, especially of uncertain events, is a dialog for the purpose of helping people deal constructively with that uncertainty. Fear of the known is better than fear of the unknown. An abundance of accurate information can cut down on speculation. The issues are to be direct, clear and relevant. In our free and information-rich society, people are used to processing information; they have demonstrated a desire for information. They often assume someone is trying to hide information if it is not available." (**PPW**, *Protecting America's Communities*, 2004, p. 8)

Public Warning Process and Goal: "The warning process consists of people with information communicating with people at risk and others, such as emergency responders, in advance of or during a hazardous event, with the intent that those at risk will take appropriate action to reduce casualties and losses. The goal of a warning is to prevent hazards from becoming disasters. -- the success of a warning is measured by what actions people take." (**Partnership for Public Warning**, *Protecting America's Communities*, 2004, p. 3)

Public Warning Process, Key Elements: "The key elements of the public warning process include:

1. **Data collection and analysis.** Development or collection of data regarding a potential hazard and the analysis of that data by experts as to the potential risk associated with the hazard.

2. **Deciding to issue a warning.** Review of the data and the expert analysis by the appropriate authorities and the reaching of a decision to issue a warning to the public.

3. **Framing the warning**. Creating a warning message for the public that includes pertinent information such as the nature of the hazard, the risk the affected area, and the protective actions that are recommended.

4. **Disseminating the warning.** Distribution of the warning through all appropriate and available channels. This could include sirens, the Emergency Alert System, the media and specialized warning services such as telephone dial-out. The warning is also disseminated to those with special needs (e.g. blind, deaf, non-English speaking).

5. Public Reception. Members of the public at risk hear the alert and understand the warning.

6. Validation. Before taking action most members of the public will seek to validate the warning by going to alternate information sources to see if the same message is being sent.

7. Take Action. Members of the public take appropriate protective action to protect themselves, their families and their property." (**PPW**, *Protecting America's Communities*, 2004, p. 5)

Public Warning System: "An all-hazard warning system suitable for all types of events is preferable to stand-alone, event-based systems. An effective public warning system is one that does far more than just alert citizens to an impending hazard. An effective public warning system is one that provides the ability for government authorities to communicate with citizens prior to, through and after the emergency event. In addition to alerting citizens, an effective public warning system provides information on how to prevent and protect against disasters, and information to assist in recovery efforts." (**Partnership for Public Warning**, *Protecting America's Communities*, 2004, p. 3)

Public Warning System Design: "Warning sources often seem to assume that there will be immediate reception of the warning, unlimited attention to the warning message, perfect comprehension of message content based upon accurate prior knowledge about the threat, and perfect compliance with the recommended actions. None of these conditions will occur, even though reception, attention, comprehension, and personalization increase when there is an imminent threat. Consequently, warning systems and warning strategies must be carefully designed to make it more likely that warnings will be as effective as possible.

The first step in warning system design is to define the desired message effects, especially the behavioral objectives of the system—what actions do authorities want the end-users to take? The second step is to identify any distinctively different segments of the target population—how do people differ in terms of their abilities to receive a warning, attend to it, comprehend its content, personalize the threat, choose an appropriate protective action, and implement that protective action? The third step is to identify the channels through which warning messages will be transmitted—what technologies and what intermediate sources are needed? Finally, warning system designers must define who the initial message sources will be and develop their perceived credibility by taking steps to ensure their expertise and trustworthiness." (**Partnership for Public Warning**, *Protecting America's Communities*, 2004, p. 7)

Public Warning System Development Strategy: "Developing a successful warning strategy requires three things:

• **Planning.** Long before an emergency occurs the appropriate officials should develop plans for when and how to issue public warnings. Key elements in any plan include the criteria for issuing a warning, the officials with the authority to issue a warning, standard terminology and the methods of distribution.

• **Public Education.** Just as important as the plan is educating the public. Information needs to be provided to the public that explains how they will be warned, what do warnings mean (e.g. if a siren goes off is it calling the volunteer firemen to the station or signaling that citizens should stay in their houses?), and where to get additional information, especially if the power is off.

• **Testing and Evaluation.** An effective warning system will be tested on a regular basis; both to make sure the system works and that citizens understand the purpose and the message. Evaluation of the system by emergency managers, government officials, the media, private sector and the public can be invaluable in identifying ways to improve the communication of warning messages." (**PPW**, *Protecting America's Communities*, 2004, pp. 5-6)

Public Works: "Organizations and individuals who make up the public/private infrastructure for the construction and management of these roles at the Federal level. The categories/roles include administration, technical, supervision, and craft (basic and advanced)." (**FEMA**, *TEI/TO Course Catalog*, 2008, 3)

Purchase Order: "Any unconditional agreement, contract or other commitment by a state or local government under state and local law for the acquisition of goods and services." (**FEMA**, *100% Funding for Direct Federal Assistance and Grant Assistance*, June 9, 2006)

Push-Pull Distribution Strategy: "DHS/FEMA uses a Push-Pull Strategy for distributing materiel. DHS/FEMA will develop a phasing plan for delivering material during the initial surge response to each incident scenario. Scenario-tailored resource/materiel packages will be pushed in phases so the regional logistics teams can focus on establishing the FOSA [Federal Operations Staging Area] and organizing their teams. The materiel and phased delivery plan will be coordinated for each scenario. Once the FOSA is established and the JFO [Joint Field Office] functional, the LCs [Logistics Center] will revert to a pull strategy for sustainment that waits for

the regional or JFO request before shipping resources." (**DHS**, *NRF Logistics Management Support Annex*, September 2007 Draft, p. 11)

PVK: Packaged Ventilation Kit. (**OCD**, *Abbreviations*, 1971, p. 4) [Program defunct.]

PVT RPM: Polyvinyl Toluene "(PVT)-based radiation portal monitors (RPM) that are currently deployed at the Nation's POEs, and select foreign POEs through the DOE Megaports Initiative." (**DHS**, *Opening Statement of Vayl Oxford*, March 2007, p. 3)

PW: Public Works.

Pyroclastic Flow: "High density flow of solid volcanic fragments suspended in gas which flows downslope from a volcanic vent (at speeds up to 200 km/h) which may also develop from partial collapse of a vertical eruption cone, subdivided according to fragment composition and nature of flowage into: ash flow, glowing avalanche…, pumice flow." (**UNDHA**, *DM Glossary*, 1992, 60)

Q3 Flood Data: "Q3 Flood Data are developed by digitizing existing hardcopy Flood Insurance Rate Maps (FIRMs) to create a thematic overlay of flood risks. This product is generally produced in a countywide format. Q3 Flood Data files contain only certain features from the existing hardcopy maps. Q3 Flood Data do not replace the existing hardcopy maps. They are designed to support planning activities, some Community Rating System (CRS) activities, insurance marketing, mortgage portfolio review, FEMA's Response and Recovery activities, and to assist in floodplain management activities at a local level. Base Flood Elevations are not included so its use is limited. Q3 Flood Data do not include a base map, are not used to produce a new version of the hardcopy FIRM, and are not reviewed by communities. They are for use with desk-top mapping and Geographic Information Systems technology." (**FEMA**, *FAQs: Digital Flood Data and Mapping*, 2007)

QNSR: Quadrennial National Security Review. (**Wormuth**, *Ready or Not?* 2008, ix)

QSII: Quad State Interoperability Initiative. (**DHS**, *Expanded Regional Collaboration,* 2006, 19)

Quad State Interoperability Initiative (QSII): "The QSII is a collaborative effort between the states of West Virginia, Virginia, Maryland, and Pennsylvania to establish a governance structure that will provide organization, planning, and implementation of policies, procedures, and projects to assure voice and data interoperable communications between states. This initiative will establish a governance structure, plan and coordinate a standardized quad state baseline, and implement a limited number of specific tangible projects. The purpose…is to overcome state boundaries and increase connectivity on the regional level to protect residents within the state, along its borders, and throughout the region including the National Capital Region." (**DHS/OGT**, *Expanded Regional Collaboration…FY 2004-2006*, 2006, p. 19)

Quadrennial Homeland Security Review (QHSR): From the 9/11 Act of 2007 (Public Law 110-53, August 3, 2007, Sec. 707 (6USC 347) Quadrennial Homeland Security Review): "In fiscal year 2009, and every 4 years thereafter, the Secretary shall conduct a review of the homeland security of the Nation (in this section referred to as a 'quadrennial homeland security

review'). ''(2) SCOPE OF REVIEWS.—Each quadrennial homeland security review shall be a comprehensive examination of the homeland security strategy of the Nation, including recommendations regarding the long-term strategy and priorities of the Nation for homeland security and guidance on the programs, assets, capabilities, budget, policies, and authorities of the Department [DHS]." (**9/11 Act** of 2007, p. 544)

"In each quadrennial homeland security review, the Secretary shall—
(1) delineate and update, as appropriate, the national homeland security strategy, consistent with appropriate national and Department strategies, strategic plans, and Homeland Security Presidential Directives, including the National Strategy for Homeland Security, the National Response Plan, and the Department Security Strategic Plan;
(2) outline and prioritize the full range of the critical homeland security mission areas of the Nation;
(3) describe the interagency cooperation, preparedness of Federal response assets, infrastructure, budget plan, and other elements of the homeland security program and policies of the Nation associated with the national homeland security strategy, required to execute successfully the full range of missions called for in the national homeland security strategy described in paragraph (1) and the homeland security mission areas outlined under paragraph (2);
(4) identify the budget plan required to provide sufficient resources to successfully execute the full range of missions called for in the national homeland security strategy described in paragraph (1) and the homeland security mission areas outlined under paragraph (2);
(5) include an assessment of the organizational alignment of the Department with the national homeland security strategy referred to in paragraph (1) and the homeland security mission areas outlined under paragraph (2); and
(6) review and assess the effectiveness of the mechanisms of the Department for executing the process of turning the requirements developed in the quadrennial homeland security review into an acquisition strategy and expenditure plan within the Department." (**9/11 Act** of 2007, pp. 544-545)

Qualitative Analysis: "Analysis that uses words rather than numbers to describe and measure the magnitude of potential consequences and the likelihood that those consequences will occur. These scales can be adapted or adjusted to suit the circumstances, and different descriptions may be used for different risks. Qualitative indicators are preferred as a way to engage as many parties as possible. In addition they may be used: As an initial screening activity to identify risks which require more detailed analysis Where this kind of analysis is appropriate for decisions, or Where the numerical data or resources are inadequate for a quantitative analysis. Qualitative analysis should be informed by factual information and data where available." (**UNDAP**, *Techniques Used in Disaster Risk Assessment*, 2008)

Qualitative Assessment: "The process for evaluating a business function based on observations and does not involve measures or numbers. Instead, it uses descriptive categories such as customer service, regulatory requirements, etc to allow for refinement of the quantitative assessment. This is normally done during the BIA phase of planning." (**DigitalCare**, *State of OR BC Workshop*, 2006, p. 61)

Quantitative Analysis: "Analysis that uses numerical values (rather than the descriptive scales used in qualitative and semi-quantitative analysis) for both consequences and likelihood. The quality of the analysis depends on the accuracy and completeness of the numerical values and the validity of the models used. Quantification does have limitations and clearly it is not possible to measure all human experience. One of the major criticisms regarding the creation of indicators is that they attempt to encapsulate complex and diverse processes into numerical form." (**UNDAP**, *Techniques Used in Disaster Risk Assessment*, 2008)

Quantitative Assessment: "The process for placing value on a business function for risk purposes. It is a systematic method that evaluates possible financial impact for losing the ability to perform a business function. It uses numeric values to allow for prioritizations. This is normally done during the BIA phase of planning." (**DigitalCare**, *State of OR BC Workshop*, 2006, p. 61)

Quantitative Risk Analysis: "**QUANTITATIVE RISK ANALYSIS** incorporates numerical estimates of frequency or probability and consequence. In practice a sophisticated analysis of risk requires extensive data which are expensive to acquire or often unavailable. Fortunately few decisions require sophisticated quantification of both frequency and consequences. (**DOT**, *Risk Management Definitions*, Office of Hazardous Materials Safety, 2005)

Quarantine: "Definition: prohibition or restriction on travel or passage, imposed to keep contagious diseases, or harmful chemicals/biologicals from spreading. "Annotation: Quarantine is not the same as isolation. Isolation refers to the separation of persons who have a specific infectious illness from those who are healthy and the restriction of their movement to stop the spread of that illness. Isolation allows for the focused delivery of specialized health care to people who are ill, and it protects healthy people from getting sick. In sum, isolation is for treatment of a known illness and quarantine is for observation of possible exposure to an agent." (**DHS**, *Lexicon; Terms and Definitions*, October 19, 2007, p. 21)

Quarantine: "`I'm concerned about what an avian flu outbreak could mean for the United States and the world,' he [the President] told reporters during a Rose Garden news conference…Such an event would raise difficult questions, such as how a quarantine might be enforced, he said. 'One option is the use of a military that's able to plan and move,' he said. 'So that's why I put it on the table. I think it's an important debate for Congress to have'." (**CNN.com**, *Military*, 5Oct 05)

Quarantine: A restraint upon the activities or communication (e.g., physical separation or restriction of movement within the community/work setting) of an individual(s) who has been exposed to an infection but is not yet ill to prevent the spread of disease; quarantine may be applied voluntarily (preferred) or on compulsory basis dependent on legal authority. (**HHS**, *Community Strategy for Pandemic Influenza Mitigation*, 2007, Glossary)

Quite Sentenial 07 Exercise: FEMA Continuity of Operations exercise used to review essential functions and Continuity of Operations Relocation Site Plans to determine secondary Continuity of Operations site locations should the need arise for the dispersion or social distancing of Emergency Relocation Members. Was run in conjunction with Pinnacle 07 utilizing a scenario which was a continuation of Pinnacle 05. (**FEMA**, OMA FY09, 2008, 16)

R2K: Readiness 2000. (**USACE**, *Readiness 2000 Tested By Storms*, 1998, p. 1)

R4C: Regional Four Corners Homeland Security Initiative. (**DHS**, *Expanded Regional Collaboration…FYs 2004-2006*, 2006, p. 15)

R/hr: Roentgens per hour. (**OCD**, *Abbreviations and Definitions*, 1971, p. 4)

RA: Regional Administrator, FEMA.

RAC: Regional Advisory Council (**FEMA**, "FEMA Names New England RAC," 3 Oct 2007)

RAC: Regional Assistance Committee. (**FEMA**, *Statement of Glen Cannon*, No, 15, 2007)

RACES: "The emergency communication system is backstopped with a highly organized network of 'radio hams' called Radio Amateur Civil Emergency Service (RACES). The Federal Communications Commission has approved the RACES plans of four States, organized from the State to county or community level." (FCDA, 1953 Annual Report, p. 29)

RACES: Radio Amateur Civil Emergency Service. "The Radio Amateur Civil Emergency Service (RACES) was established under the Federal Communications Commission Rules and Regulations, as part of the amateur radio service. The mission of RACES is to establish and maintain the leadership and organizational infrastructure necessary to provide amateur radio communications in support of emergency management entities throughout the United States and its territories. RACES is employed during a variety of emergency/disaster situations where normal governmental communications systems have sustained damage or when additional communications are required or desired. Situations that RACES can be used include: natural disasters, technological disasters, civil disorder, nuclear/chemical incidents, acts of terrorism or enemy attack. Through its courses and programs, USRACES.org serves as the national focal point for the development and delivery of emergency communications training and publications to enhance the Emergency Support Function 2 - Communications capabilities of federal, state, and local governments, volunteer organizations, and the public and private sectors to minimize the impact of disasters on the American public." (**USRACES**, *About RACES*, 2007)

Rad: "A unit of absorbed dose of radiation; it represents the absorption of 100 ergs of nuclear (or ionizing) radiation per gram of absorbing material, such as body tissue." (**Glasstone**, *The Effects of Nuclear Weapons*, 3rd Ed., 1977, Glossary, p. 638)

RADCON: Radiological Control. (**JCS/DOD**, *CBRNE CM*, 2006, p. III-6)

RADEF: Radiological Defense. (**OCD**, *Abbreviations and Definitions*, 1971, p. 4)

Radiation: Emission or transfer of energy in the form of electromagnetic waves or particles. (**WMO** 1992, 492)

Radiation Sickness: "An illness resulting from excessive exposure to ionizing radiation. The earliest symptoms are nausea, vomiting, and diarrhea, which may be followed by loss of hair, hemorrhage, inflammation of the mouth and throat, and general loss of energy." (**DoD**, *DOD Dictionary of Military and Related Terms*, 2007)

Radioactive Fallout: "Any nuclear blast results in some fallout. Blasts that occur near the earth's surface create much greater amounts of fallout than blasts that occur at higher altitudes. This is because the tremendous heat produced from a nuclear blast causes an up-draft of air that forms the familiar mushroom cloud. When a blast occurs near the earth's surface, millions of vaporized dirt particles also are drawn into the cloud. As the heat diminishes, radioactive materials that have vaporized condense on the particles and fall back to Earth. The phenomenon is called radioactive fallout. This fallout material decays over a long period of time, and is the main source of residual nuclear radiation.

"Fallout from a nuclear explosion may be carried by wind currents for hundreds of miles if the right conditions exist. Effects from even a small portable device exploded at ground level can be potentially deadly.

"Nuclear radiation cannot be seen, smelled, or otherwise detected by normal senses. Radiation can only be detected by radiation monitoring devices. This makes radiological emergencies different from other types of emergencies, such as floods or hurricanes. Monitoring can project the fallout arrival times, which will be announced through official warning channels. However, any increase in surface build-up of gritty dust and dirt should be a warning for taking protective measures." (**FEMA**, *Are You Ready? Nuclear Blast*, 2006)

Radioactive Fallout Threat: "On September 28, 1954, the FCDA made public certain of the facts about radioactive fallout and provided beginning information on civil defense measures to cope with this threat." (**FCDA**, *1954 Annual Report*, pp. 1-2)

Radioactive Material: "material which spontaneously emits ionizing radiation as a consequence of radioactive decay." (**Commonwealth of Australia**, *Recommendations for Limiting Exposure to Ionizing Radiation*, 1995, Glossary, p. r-36)

Radiological Accident: "A loss of control over radiation or radioactive material that presents a hazard to life, health, or property or that may result in any member of the general population exceeding exposure limits for ionizing radiation." (**DoD**, *DoD Response to Radiological Accidents*, 1996, p. 10)

Radiological and Nuclear Countermeasure System Architectures Analysis (RNCSAA): "The Radiological and Nuclear Countermeasure System Architectures Analysis (RNCSAA) program was initiated in February 2004 to address the threat of terrorist use of a radiological dispersal device, improvised nuclear device, or nuclear weapon in the U.S. through a comprehensive systems approach that emphasizes early detection and effective intervention capabilities at the federal, State and local levels." (**DHS**, *NCRC First Annual Report*, 2005, 81)

Radiological Assistance Program (RAP): "The U.S. Department of Energy (DOE) created the Radiological Assistance Program (RAP) in the 1950s to make DOE resources and expertise available to organizations responding to incidents involving radioactive materials. Management responsibilities and direction for the RAP are primarily contained in DOE Order 5530.3. RAP provides resources (trained personnel and equipment) to evaluate, assess, advise, and assist in the mitigation of actual or perceived radiation hazards and risks to workers, the public, and the environment. RAP is divided into eight geographical regions, each managed by a Regional Coordinating Office. Each region has one or more RAP response teams… Regional coordination is intended to provide a timely response capability and to foster a working relationship between DOE and the emergency response elements of other federal agencies, states, and tribes." (**DOE**, *RAP Program Information*, Accessed November 16, 2007).

Radiological Defense Program: "A Radiological Defense (RADEF) Program is essential to minimize effects of radiation hazards in the event of a nuclear attack and to facilitate recovery efforts. RADEF provides:
(1) Shelter monitoring to assess and evaluate protection of occupants against radiation.
(2) Radiological monitoring for self-protection of personnel engaged in emergency services functions, operation of primary facilities, and in recovery operations.
(3) Recovery techniques including decontamination and related countermeasures." (**USACE**, *Planning and Operations Guidelines, Annex B: Emergency Relocation Sites*, 1985, p. B-6)

Radiological Dispersion/Dispersal Devise (RDD): "A Radiological Dispersion Devise, or "dirty bomb", is a mix of explosives with radioactive powder or pellets. When it explodes the blast scatters radioactive material.

- A dirty bomb is not the same as an atomic bomb, which produces an atomic mushroom cloud.
- A dirty bomb cannot create an atomic blast. It uses dynamite or other explosives to scatter radioactive materials which cause radioactive contamination….

The terrorists' purpose is to spread fear. The main danger from a dirty bomb is the explosion, which can cause serious injuries and damage. The radioactive materials in a dirty bomb would probably not lead to enough radiation exposure to cause serious illness immediately, except to those people who are very close to the blast site. However, the radioactive dust and smoke that spreads could be dangerous to health if they are inhaled." (**FEMA**, "Fact Sheet – Dirty Bombs" (FEMA 573), NIMS Integration Center, June 2007, p. 1)

Radiological Dispersion/Dispersal Devise (RDD): "The RDD is a device or mechanism that spreads radioactive material over an area with intent to cause harm, from the detonation of conventional explosives or other means. It is very difficult to construct an RDD that would deliver radiation doses high enough to cause immediate health effects or fatalities in a large number of people. However, if these materials are stolen or otherwise acquired, whether in the US or abroad, they could be used in an RDD to contaminate facilities, urban areas, or places where people live, disrupting lives and livelihood causing fear and anxiety, and leading to significant social and economic damage. The cost to clean up and recover following a moderately large RDD has been estimated to be billions of dollars. An RDD could effectively

cause an area to be inaccessible for a long period of time." (**FEMA**, *Statement for the Record, Glenn M. Cannon*, 2007, p. 2)

Radiological Dispersion/Dispersal Devise (RDD): "Radiological dispersal devices (RDDs) are devices, other than a nuclear explosives device, designed to disseminate radioactive material in order to cause destruction, damage, area denial, or injury.

"(a) RDDs are designed to disperse radiation and/or contamination. One design, called "dirty bombs," uses explosives to disperse radioactive contamination. A dirty bomb typically generates its immediate casualties from the direct effects of the conventional explosion (i.e., blast injuries and trauma). The main purpose of a dirty bomb is to frighten people by contaminating their environment with radioactive materials and threatening large numbers of people with exposure. Their use may also result in area denial and costly cleanup or decontamination.

"(b) By scattering the radiological material, the RDD may create a large area of radiological contamination. The actual dose-rate will be dependent upon the type and quantity of radioactive material spread over the area. This may not be uniformly distributed. As an area denial weapon, an RDD can generate significant public fear and economic impact since the area affected may involve loss of use during a lengthy and costly decontamination process. The contaminated area poses a danger to individuals by external or internal radiological contamination. External contamination on individuals can usually be removed by surface cleaning, and by removing contaminated clothing. Internal contamination is much more dangerous and occurs when contaminants are ingested and/or inhaled and concentrate in tissue. This may result in prolonged, high intensity local radiation exposure." (**JCS/DOD**, *CBRNE CM,* 2006, pp. I-7 and I-8)

Radiological Emergency: A radiological incident that poses an actual, potential, or perceived hazard to public health or safety or loss of property. (**FRERP**, *Appendix B*)

Radiological Emergency Preparedness (REP).

Radiological Emergency Preparedness Program (REPP): "The Federal Emergency Management Agency (FEMA) established the REP Program to ensure the public health and safety of citizens living around commercial nuclear power plants by protecting them in the event of a nuclear power station accident and informing and educating the public about radiological emergency preparedness. It helped contribute to the *HSEEP* methodology." (**FEMA**, *Homeland Security Exercise and Evaluation Program,* 2008)

Radiological Emergency Preparedness Program (REPP): "We will assist State, local, and tribal governments in the development of offsite radiological emergency preparedness plans within the emergency planning zones of Nuclear Regulatory Commission (NRC) licensees of commercial nuclear power facilities. REPP will continue to support the development of offsite radiological emergency preparedness plans for the emergency planning zones of NRC licensees of commercial nuclear power facilities." (**FEMA**, *Vision for New FEMA*, 12Dec2006, pp. 24-25)

Radiological Emergency Response Teams (RERT's): "Teams provided by EPA's Office of

Radiation and Indoor Air to support and respond to incidents or sites containing radiological hazards. These teams provide expertise in radiation monitoring, radionuclide analyses, radiation health physics, and risk assessment." (**USCG**, *IM Handbook*, 2006, Glossary 25-20)

Radiological Survey: "The directed effort to determine the distribution and dose rates of radiation in the area." (**DA**, *WMD-CST Operations*, December 2007, Glossary-16)

Radiological Terrorist Event: "For the purposes of this position statement a radiological terrorist event is defined as the intentional release of radioactive material to the environment or use of a source of radiation for the purpose of harming the health or safety of the public. It includes any type of device or method used to disperse radioactive material, including conventional explosive materials (i.e., a dirty bomb) and improvised nuclear weapons." (**Health Physics Society**, *Guidance for Protective Actions Following a Radiological Terrorist Event*, 2004, p. 3)

RADM: Real Admiral. (**FEMA**, *Region III Annual Report FY 2007*, 2008, 30)

RadNet: "RadNet is a national network of monitoring stations that regularly collect air, precipitation, drinking water, and milk samples for analysis of radioactivity. The RadNet network, which has stations in each State, has been used to track environmental releases of radioactivity from nuclear weapons tests and nuclear accidents. Future uses of this network might include monitoring waste disposal and radioactive cleanup sites. RadNet also documents the status and trends of environmental radioactivity; these data are published by NAREL in a quarterly report entitled *Environmental Radiation Data*." (**EPA**, *RadNet – Tracking Environmental Radiaton Nationwide*, February 13, 2009 Update)

RAMCAP: Risk Analysis and Management for Critical Asset Protection. (**DHS,** *NIPP* 2006, 102)

RAMONT: Radiological Monitoring. (**OCD**, *Abbreviations*, 1971, p. 4) [Program defunct]

RAMP: Remedial Action Management Plan/Program. (**DHS**, *NRF Logistics Management Support Annex*, 2007 Draft, p. 4)

RAP: Radiological Assistance Program, DOE.

RAP: Resource Allocation Plan. DHS 2008

RAPID: Risk Assessment Process for Informed Decision-making. (**DHS**, *IPG FY 2011*, 9)

RapidCom: "In May 2004, former DHS Secretary Ridge announced the launch of RapidCom, an initiative to help improve capabilities for immediate, incident-level, interoperable emergency communications in ten high-threat urban areas. The SAFECOM program led the effort, working in cooperation with federal partners such as the DHS Office for Domestic Preparedness (ODP), Department of Justice (DOJ) 25 Cities program, and the National Institute of Justice CommTech program to provide assistance to the following urban areas:

- Boston, Massachusetts

- Chicago, Illinois
- Houston, Texas
- Jersey City, New Jersey
- Los Angeles, California
- Miami, Florida
- National Capital Region
- New York, New York
- Philadelphia, Pennsylvania
- San Francisco, California

Program Description – RapidCom has provided assistance to incident commanders to improve their abilities to adequately communicate with each other and their respective command center within one hour of a major incident. RapidCom NCR's main function was to provide emergency-level communications interoperability assistance." (**DHS**, *National Capital Region Coordination First Annual Report*, 2005, p. 82)

Rapid Deepening: "A decrease in the minimum sea-level pressure of a tropical cyclone of 1.75 mb/hr or 42 mb for 24 hours." (**NHC**, *Glossary of NHC Terms*, 2007)

Rapid Needs Assessment (RNA) Teams: "These teams deploy to assess damages in the affected area as soon as possible. The team is a composite of State and Federal interagency personnel that are organized and controlled by the State Coordinating Officer and the Federal Coordinating Officer—or Emergency Response Team-Advance team leader if an Federal Coordinating Officer has not been appointed." (**FEMA**, *Federal Interim Contingency Plan – Predecisional Draft: NMSZ*, December 15, 2007, p. 21)

RCBAP: Residential Condominium Building Association Policy. (**FEMA**, *Call for*…, 2000, xxiii)

RCP: Regional Catastrophic Preparedness Grant Program. (**DHS**, *Fact Sheet FY08 PrepGrants*)

RCPGP: Regional Catastrophic Preparedness Grant Program. (**FEMA**, *RCPGP*, 1 Feb 2008)

RCS: Regional Communications System. (EG&G, *San Diego County Firestorms AAR*, Feb08, 42)

RDD: Radiological Dispersion Device. (**DHS**, *TCL*, 2007 Draft, p. 274)

RDDs: Radiological Detection Devices. (**DHS**, *NCRC, First Annual Report*, 2005, p. F-40 (80))

RDECOM: United States Army Research, Development and Engineering Command

RDO: Radiological Defense Officer. (**DCPA**, *On-Site Assistance Appendices*, 1974) [defunct]

RDPC: Rural Domestic Preparedness Consortium. (**EKU**, *RDPC Launched*, 28 May 2007)

RDSTF: Regional Domestic Security Task Force, Florida.

RDTE: Research, Develop, Test, and Evaluate. (**FEMA**, *Compendium of Federal Terrorism Training Courses*, 2003, p. 12)

Readiness: "…an overall judgment concerning the probability that the organization could successfully perform some specified task if asked to do so" (**Campbell**, John S. "On the Nature of Organizational Effectiveness," in *New Perspectives on Organizational Effectiveness,* ed. Paul S. Goodman and Johannes M. Pennings and Associates (San Francisco: Jossey Bass, 1977), 39, as quoted in Banerjee and Gillespie, "Linking Disaster Preparedness," 131; quoted in Light, *Predicting Organizational Crisis Readiness*, 2008, p. 13)

Readiness: "Readiness is the ability of an organization to respond to an incident." (**DHS**, *FCD 1*, November 2007, p. 4)

Readiness: "Definition: condition of being prepared and capable to act or respond as required." (**DHS**, *Lexicon: Terms and Definitions*, October 19, 2007, p. 22)

Readiness: "The definition of *readiness,* as found in the *Oxford English Dictionary,* focuses on more than the obvious "quality, state or condition of being ready." It also suggests "promptness in voluntary action," "quickness or facility with which something is done," and "a state or preparation" or "the condition or fact of being ready or fully prepared." (**Oxford English Dictionary,** 2nd ed., s.v. "readiness."**;** cited in Light, *Predicting Organizational Crisis Readiness*, 2008, 13)

Readiness and Emergency Management for Schools Technical Assistance Center (REMS TA Center), DOE: "The U.S. Department of Education's Office of Safe and Drug-Free Schools (OSDFS) began administering the REMS (formerly, Emergency Response and Crisis Management) discretionary grant program in October 2003 to help school districts develop comprehensive plans for any emergency or crisis, including natural disasters, pandemic influenza, violent incidents, and terrorist acts. A primary service coordinated by the Center is the provision of responses to emergency planning questions and technical assistance needs. Requests for assistance could range from example REMS plans; to strategies and materials to help with staff trainings; to tips for creating buy-in with stakeholders; to help evaluating REMS plans. Center staff collaborate with a network of local and national crisis planning experts to provide answers to REMS-related questions and to meet any specific technical assistance needs." (DOE, *REMS TA*, Folsom, CA (http://rems.ed.gov/), Accessed April 25, 2008)

Readiness Reporting System (RRS): "Department of Homeland Security program to collect and manage continuity capability data and assessments of executive branch departments and agencies and their status to perform their Priority Mission Essential Functions (PMEFs) in support of the National Essential Functions (NEFs). The RRS will be used to conduct assessments and track capabilities at all times under all conditions, to include natural disasters, manmade incidents, terrorism, and war." (**Homeland Security Council**, *NCPIP*, 2007, p. 67)

Readiness To Act – 5th of Five Key National Response Framework Principles: "Effective response requires readiness to act balanced with an understanding of risk. From individuals, households, and communities to local, tribal, State, and Federal governments, national response

depends on the instinct and ability to act. A forward-leaning posture is imperative for incidents that have the potential to expand rapidly in size, scope, or complexity, and for no-notice incidents…. Well-developed public information, education strategies, and communication plans help to ensure that lifesaving measures, evacuation routes, threat and alert systems, and other public safety information are coordinated and communicated to numerous diverse audiences in a consistent, accessible, and timely manner." (**DHS**, *NRF*, Jan 2008, 11-12)

Rebuilding and Revitalization: "Rebuilding and revitalization efforts are distinguished from shorter-term recovery efforts not only by the length of time involved, but also by the scope and nature of the incident, the complexity of efforts required to regenerate infrastructure, and the effect on the social fabric of the community and region….

The majority of reconstruction efforts will occur beyond the Federal Government's purview. However, the Federal Government, in collaboration with all stakeholders, will draw upon and apply the field's most innovative thinking, lessons learned, and best practices to create a comprehensive framework for our Nation that fully appreciates free markets and the vast power of incentives and empowers individuals, businesses, and non-profit groups in the decisions about the future of their communities. In order to develop this new framework, our Nation must continue to assess the challenges in this area and provide recommendations to improve our ability to rebuild and revitalize areas following a catastrophic natural or man-made disaster. We must determine how Federal, State, local, and Tribal governments, the private and non-profit sectors, and communities can improve collaboration and develop recommendations that further economic renewal and help stabilize and reconstruct communities. In addressing these challenges, Federal, State, local, and Tribal governments, the private and nonprofit sectors, and communities must be focused on citizens – and not on bureaucracy or processes – and be guided by the concepts of compassion, speed, efficiency, common sense, and the devolution of as many decisions as reasonably possible to individual citizens, businesses, and communities." (**White House**, *National Strategy for Homeland Security*. Washington, DC: Homeland Security Council, October 2007, p. 37-38)

RECA: Residual Capability Assessment. (**DoD**, *MSCA* (Directive 3025.1), 1993, p. 22)

Reception Area (NIMS): "This refers to a location separate from staging areas, where resources report in for processing and out-processing. Reception Areas provide accountability, security, situational awareness briefings, safety awareness, distribution of IAPs, supplies and equipment, feeding, and bed down." (**DHS**, *NIMS*, 2004, p. 136)

Reconstitute Government Services: "Definition: Reinstate government services and operations interrupted by, or in response to, an incident." (**DHS**, *UTL 2.1*, 2005, p. 110)

Reconstitution: "The process by which surviving and or replacement agency personnel resume normal agency operations from the original or replacement primary operating facility." (**DHS**, *FCD 1*, Nov. 2007, P-9)

Reconstitution Operations: "Agencies must identify and outline a plan to return to normal operations once agency heads or their successors determine that reconstitution operations for resuming normal business operations can be initiated. Agencies must

1. Provide an executable plan for transitioning back to efficient normal operational status from continuity of operations status, once a threat or disruption has passed
2. Coordinate and preplan options for agency reconstitution regardless of the level of disruption that originally prompted the agency to implement its continuity of operations plan. These options must include moving operations from the continuity or devolution location to either the original operating facility or, if necessary, to a new operating facility
3. Outline the necessary procedures, whether under a standard continuity of operations scenario or under a devolution scenario, for conducting a smooth transition from the relocation site to a new facility." (**DHS**, *FCD 1*, Nov. 2007, p. M-1)

Reconstruction: "Actions taken to re-establish a community after a period of rehabilitation subsequent to a disaster. Actions would include construction of permanent housing, full restoration of all services, and complete resumption of the pre-disaster state." (**UNDHA**, *DM Glossary*, 1992, 61; cites OFDA)

Reconstruction: "Actions taken under the surviving command authority to reestablish a damaged or destroyed headquarters staffed by survivors of the attack." (**USACE**, *Planning and Operations Guidelines, Annex V: Definitions and Common* Terms, 1985, p. V-4)

Recover: "Activities that include the development, coordination, and execution of service- and site-restoration plans; the reconstitution of government operations and services; individual, private- sector, nongovernmental, and public-assistance programs to provide housing and to promote restoration; long-term care and treatment of affected persons; additional measures for social, political, environmental, and economic restoration; evaluation of the incident to identify lessons learned; post-incident reporting; and development of initiatives to mitigate the effects of future incidents (Source—NIMS, March 2004)." (**DHS/ODP**, *State and Urban Area Homeland Security Strategy: Guidance on Aligning Strategies with the NPG*, 2006, p. 4)

Recover: "Definition of Recover: Develop, coordinate, and execute service- and site-restoration plans and reconstitute government operations and services through individual, private-sector, nongovernmental, and public assistance programs." (**DHS**, *Universal Task List 2.1*, 2005, p. 99)

Recovery: (See, also, "Response and Recovery" (FEMA 1996).)

Recovery: "The recovery mission is the sustained commitment to return an impacted population and geographic area to a sustainable standard of living following an incident. This supports the goal of creating resilient populations and communities. Whereas response is focused primarily on minimizing immediate impacts, minimizing immediate consequences, and setting the conditions for long-term success, recovery is focused on restoring societies. Without a commitment to that restoration, resiliency is not possible." (**DHS**, *Capstone Doctrine Pub 1 Draft*, Chapter 2, 2008, p. 2-6)

Recovery: "The implementation of prioritized actions required to return an organization's processes and support functions to operational stability following an interruption or disaster." (**DHS**, *FCD 1*, Nov. 2007, P-9)

Recovery: "Recovery involves actions, and the implementation of programs, needed to help individuals and communities return to normal. Recovery programs are designed to assist victims and their families, restore institutions to sustain economic growth and confidence, rebuild destroyed property, and reconstitute government operations and services. Recovery actions often extend long after the incident itself. Recovery programs include mitigation components designed to avoid damage from future incidents. Typical recovery actions may include:

1. Repair and replacement of disaster damaged public facilities (roads, bridges, municipal buildings, schools, hospitals, qualified non-profits);
2. Debris cleanup and removal;
3. Temporary housing and other assistance for disasters victims and their families;
4. Low-interest loans to help individuals and businesses with long-term rebuilding and mitigation measures;
5. Restoration of public services (electric power, water, sewer, telephone);
6. Crisis counseling and mental health;
7. Disaster unemployment; and
8. Planning and programs for long-term economic stabilization, community recovery and mitigation." (**DHS**, *National Response Plan* (Draft #1), Feb. 25, 2004, p. 16)

Recovery: "The development, coordination, and execution of service- and site-restoration plans for impacted communities and the reconstitution of government operations and services through individual, private sector, nongovernmental, and public assistance programs that identify needs and define resources; provide housing and promote restoration; address long-term care and treatment of affected persons; implement additional measures and techniques, as feasible; evaluate the incident to identify lessons learned; and develop initiatives to mitigate the effects of future incidents." (**DHS,** *NIPP*, 2006, p. 104)

Recovery: "Implementing the prioritized actions required to return the processes and support functions to operational stability following an interruption or disaster." (**DigitalCare**, *State of OR BC Workshop*, 2006, p. 61)

Recovery: The coordinated process of supporting emergency-affected communities in reconstruction of the physical infrastructure and restoration of emotional, social, economic and physical well-being. (**EMI Australia** 1996)

Recovery: Those long-term activities and programs beyond the initial crisis period of an emergency or disaster and designed to return all systems to normal status or to reconstitute these systems to a new condition that is less vulnerable. (**FEMA**, **1992**)

Recovery: "Recovery is the effort to restore infrastructure and the social and economic life of a community to normal, but it should incorporate mitigation as a goal. For the short term, recovery may mean bringing necessary lifeline systems (e.g., power, communication, water and sewage, and transportation) up to an acceptable standard while providing for basic human needs (e.g., food, clothing, and shelter) and ensuring that the societal needs of individuals and the

community are met (e.g., maintain the rule of law, provide crisis counseling, demonstrate that people do care and that help is becoming available). Once some stability is achieved, the jurisdiction can begin recovery efforts for the long term, restoring economic activity and rebuilding community facilities and family housing with attention to long-term mitigation needs." (**FEMA,** *Guide For All-Hazard Emergency Operations Planning* (SLG 101), **1996**, p. 9)

Recovery: Activities traditionally associated with providing Federal supplemental disaster recovery assistance under a Presidential major disaster declaration. These activities usually begin within days after the event and continue after the response activities' cease. Recovery includes individual and public assistance programs, which provide temporary housing assistance, grants and loans to eligible individuals and government entities to recover from the effects of a disaster. (**FEMA** *FRP***, 1999**, Appendix B)

Recovery: "Rebuilding communities so individuals, businesses, and government infrastructure can function on their own, return to normalcy, and are protected against future hazards." (**FEMA**. *A Nation Prepared – FEMA Strategic Plan – Fiscal Years 2003-2008*, **2002**, p. 59 (Glossary))

Recovery: "The Recovery mission area is the development, coordination, and execution of service- and site-restoration plans for impacted communities and the reconstitution of government operations and services through individual, private-sector, non-governmental, and public assistance programs that: identify needs and define resources; provide housing and promote restoration; address long-term care and treatment of affected persons; implement additional measures for community restoration; incorporate mitigation measures and techniques, as feasible; evaluate the incident to identify *lessons learned*; and develop initiatives to mitigate the effects of future incidents." (**FEMA**, *Homeland Security Exercise & Eval Pgm Glossary*, 08)

Recovery: "The development, coordination, and execution of service− and site-restoration plans; the reconstitution of government operations and services; individual, private sector, nongovernmental, and public assistance programs to provide housing and to promote restoration; long-term care and treatment of affected persons; additional measures for social, political, environmental, and economic restoration; evaluation of the incident to identify lessons learned; postincident reporting; and development of initiatives to mitigate the effects of future incidents." (**DHS**, *National Preparedness Goal*, December 2005 draft {citing NIMS March 2004); **FEMA**, *National Incident Management System* (FEMA 501/Draft), August 2007, pp. 156-157)

Recovery: "…recovery is considered as: 'the coordinated process of supporting the reconstruction of physical infrastructure and the restoration of economic, physical and emotional well being. Through this process, it is preferable that individuals and communities are supported in the management of their own recovery as they know best what their needs are, and this approach is most likely to build community capacity and sustainability.'" (**Gov. of South Australia**, *Collaboration is the Key*, 2005, p. 3)

Recovery/Remediation: "The ability to restore essential services, businesses, and commerce; cleanup the environment and render the affected area safe; compensate victims; provide long-term mental health and other services to victims and the public; and restore a sense of well-being in the community." (**Homeland Security Council**, *National Planning Scenarios*, 2006 Final, p. vi)

Recovery: "The phase beyond response that addresses physical and financial restoration of the impacted population and area, including developing and implementing strategic plans for full restoration, improvement and growth. Activities include development, coordination, and execution of service- and site-restoration plans; the reconstitution of government operations and services; individual, private-sector, and public-assistance programs to provide housing and to promote restoration; long-term care and treatment of affected persons; additional measures for social, political, environmental, and economic restoration; evaluation of the incident to identify lessons learned; and post-incident reporting." (**HHS**, *Medical Surge Capacity and Capability Handbook*, August 2004, p. D-10, Glossary)

Recovery: "At the onset of an emergency, emergency management officials begin recovery efforts. Recovery is both short-term activity intended to restore vital life -support systems, and long-term activity designed to return infrastructure systems to pre-disaster conditions. Recovery also includes cost recovery efforts." (**Little Hoover Com**., *Safeguarding Golden State*, 2007, 6)

Recovery: "The process of rebuilding, restoring and rehabilitating the community following an emergency." (**London Resilience**, *London Recovery Management Protocol,* 2008, 2; citing *Emergency Response and Recovery Guidance*, HM Government)

Recovery: "The process of restoring community infrastructure and social and economic systems following an emergency or disaster." (**Michigan DEM**, 1998, 7)

Recovery: "Activities and programs designed to return conditions to a level that is acceptable to the entity." (**NFPA 1600**, 2007, p. 8)

"Recovery programs are designed to assist victims and their families, restore institutions to suitable economic growth and confidence, rebuild destroyed property, and reconstitute government operations and services. Recovery actions often extend long after the incident itself. Recovery programs include mitigation components designed to avoid damage from future incidents." (**NFPA 1600**, 2007, p. 11-12)

Recovery: "Recovery activities continue until all systems return to normal or better. They include two sets of activities: Short-term recovery activities return vital life-support systems to minimum operating standards (for example, cleanup, temporary housing). Long-term recovery activities may continue for a number of years after a disaster. Their purpose is to return life to normal, or improved levels (for example, redevelopment loans, legal assistance, and community planning)." (**NGA**, *Comprehensive Emergency Management Governors' Guide*, 1979, p. 13)

Recovery: "…recovery measures encompass what has traditionally been called reconstruction and recovery; ultimately the rebuilding of the disaster-impacted community." (**Peterson and Perry** 1999, 242; citing Drabek, 1986)

Recovery: "…rebuilding communities so individuals, businesses, and governments can function on their own, return to normal life, and protect against future hazards." (**Post-Katrina Emergency Management Reform Act of 2006**, p. 1399)

Recovery: "Decisions and actions taken after a disaster with a view to restoring or improving the pre-disaster living conditions of the stricken community, while encouraging and facilitating necessary adjustments to reduce disaster risk." **World Health Organization**, *Mass Casualty Management* Systems, April 2007, p. 31)

Recovery: "As an essential component of homeland security, the United States will build and maintain various financial, legal, and social systems to recover from all forms of terrorism. We must, therefore, be prepared to protect and restore institutions needed to sustain economic growth and confidence, rebuild destroyed property, assist victims and their families, heal psychological wounds, and demonstrate compassion, recognizing that we cannot automatically return to the pre-attack norm." (**White House**, *National Strategy for HS*, 2002, 3)

Recovery, Long Term: "Long-term recovery, which is outside the scope of the *Framework* [NRF] may involve some of the same actions but may continue for a number of months or years, depending on the severity and extent of the damage sustained. For example, long-term recovery may include the complete redevelopment of damaged areas." (**DHS**, *NRF,* 2008, p. 45)

Recovery (Short Term): "Short-term recovery is immediate and overlaps with response. It includes actions such as providing essential public health and safety services, restoring interrupted utility and other essential services, reestablishing transportation routes and providing food and shelter for those displaced by the disaster. Although called "short term," some of these activities may last for weeks." (**DHS,** *National Response Framework -- Federal Partner Guide* (Comment Draft), September10, 2007, p. 18)

Recovery (Short Term): "Even as the immediate imperatives for response to an incident are being addressed, the need to begin recovery operations emerges. In an almost imperceptible evolution, response efforts will transition to short-term recovery operations, such as the restoration of interrupted utility services, reestablishment of transportation routes, and the provision of food and shelter for those displaced by the disaster – actions that will help individuals, communities, and the Nation return to a general state of normalcy. While short-term recovery efforts are the primary responsibility of States and communities, they also involve significant contributions from all sectors of our society – Federal, State, local, and Tribal governments, the private sector, nonprofit partners, as well as individual citizens. As the priorities and needs of an incident evolve, people, assets, and resources will be reassigned or demobilized to provide a flexible and scalable response, evolving as needs evolve, changing as the incident priorities change. As immediate life-saving and life-sustaining activities subside, and short-term recovery decisions are made over a period of weeks or even months, we must recognize that these efforts are steps to an effective transition to long-term rebuilding and revitalization efforts." (**White House**, *National Strategy for Homeland Security*, Homeland Security Council, October 2007, p. 37)

Recovery Exit Strategy: "Just what is included in the recovery phase is open to question. This paper does not address "exit criteria." The recovery phase must have pre-existing exit criteria which are used to generate goals that indicate when success has been achieved during the recovery phase. Otherwise, as with post-Katrina, success is a moving target and the questions of

how much recovery is needed and how much can be afforded leave the operational realm and enter the political realm." (**Perkins**, *Shaping DHS Doctrine…*, 2007, p. 21, footnote13)

Recovery Objectives (DHS):

"*Objective 5.1 Strengthen nationwide recovery plans and capabilities.* We will work with our partners to ensure the Nation's capability to recover from multiple or simultaneous disasters, including terrorist use of weapons of mass destruction, other man-made hazards and natural disasters, through the development and maintenance of short- and long-term plans and capabilities." (**DHS**, *Strategic Plan 2004*, p. 32)

"*Objective 5.2 Provide scalable and robust all-hazard recovery assistance:* We will lead the Nation's recovery from the impacts of disasters and emergencies. We will deliver timely and appropriate assistance to individuals and families following acts of terrorism, natural disasters and other emergencies, acknowledging the unique requirements of recovery from catastrophic disasters and weapons of mass destruction events. We will provide help to restore services and public facilities, and provide states and other partners with professional, readily deployable, trained and certified leaders and staff to manage all levels and types of disasters. We will make assistance available to states and local governments for the management, mitigation and control of local hazards and emergencies, which threaten to become major disasters." (**DHS**, *Strategic Plan 2004*, p. 32)

Recovery Plan: "A plan developed by each State, with assistance from the responding Federal agencies, to restore the affected area." (**USG**, *USG Interagency Domestic Terrorism CONPLAN*, Appendix B: Definitions, 2001)

Recovery Planning (Successful Steps): "

- Take advantage of the window of opportunity to develop an overall recovery strategy**.** The outside funding and technical assistance that becomes available after a disaster can help your community make progress on its long-term goals.
- **Establish community goals and objectives.** Take the time and effort to unite the community behind agreed-upon goals and objectives.
- **Consider the planning process as well as the plan itself.** Structure the planning process so that it is open and participatory, but also quickly leads to agreement on a broad framework for recovery.
- **Employ multi-objective planning.** Look for opportunities to reap multiple benefits when incorporating hazard mitigation and sustainable redevelopment concepts into your recovery efforts.
- **Be flexible.** The recovery process evolves rapidly and flexibility is mandatory. Keep your options open and take advantage of unexpected opportunities.
- **All sources of funding are fair game.** Don't overlook non-disaster related grant programs. If expertise is not locally available, seek experienced grant writing assistance from other sources, such as regional or State agencies and the private sector.
- **Maximize community stakeholder involvement.** Recruit local corporations, foundations, and nonprofit or civic organizations to participate in the planning process.
- **Maximize the use of non-traditional partners.** Marshal local nonprofit groups and organizations to supplement Federal and State agency support.

- **Stay out of the weeds.** The recovery plan should be brief. Prioritize immediate, short-term, and long-term recovery actions; detailed design, architectural, and engineering plans can follow later." (**FEMA**, *Rebuilding For A More Sustainable Future: An Operational Framework*, November 1, 2000, p. 3-3

Recovery Point Objective (RTO): "From a business perspective RPO is the maximum amount of data loss the business can incur in an event. The targeted point in time to which systems and data must be recovered after an outage as determined by the business unit." (**DigitalCare**, *State of OR BC Workshop*, 2006, p. 62)

Recovery Principles:
- timely and responsive;
- leadership;
- people focus;
- locally and community driven;
- partnerships;
- coordination;
- integration and sustainability;
- fair and transparent administration;
- communication;
- information management;
- planning; and
- efficient and effective management. (**Gov. of South Australia**, *Collaboration is the Key*, 2005, pp. 3-4)

Recovery Site: "A designated site for the recovery of business unit, technology, or other operations, which are critical to the enterprise. Related Terms: Alternate Site, Cold Site, Hot Site, Interim Site, Internal Hot Site, and Warm Site." (**DigitalCare**, *State of Oregon BC Workshop*, 2006, p. 62)

Recovery Strategy: "The recovery strategy should include provisions for the return of the following services, as applicable:

(1) Critical infrastructure (water, gas, electricity, and waste management)
(2) Telecommunications and cyber systems
(3) Distribution systems or networks for essential goods (food, clothing, personal supplies, and services)
(4) Transportation systems, networks and infrastructure
(5) Built environment (including residential, commercial, and industrial uses)
(6) Psychosocial services
(7) Health services
(8) Continuity of governance systems." (**NFPA 1600**, 2007, p. 16)

Recovery Time Objective (RTO): "The period of time within which systems, applications, or functions must be recovered after an outage (e.g. one business day). RTO's are often used as the basis for the development of recovery strategies, and as a determinant as to whether or not to

implement the recovery strategies during a disaster situation. Similar Terms: Maximum Allowable Downtime." (**DigitalCare**, *State of Oregon Business Cont. Workshop*, 2006, p. 62)

Recovery Time Objective (RTO): "Time goal for the restoration and recovery of functions or resources based on the acceptable down time in case of a disruption of operations." (**ISO 22399**, *Societal Security*…, 2007, 5)

RECP: Regional Emergency Coordination Plan.

Red Book: *Interagency Standards for Fire and Aviation Operations,* NIFC Boise, ID.

Red Team/Red Teaming: "Analytical Red Teaming uses an adversary perspective to advance security by providing an alternative view of threats, vulnerabilities, and countermeasures. Without testing the physical limitations of antiterrorism measures analytical red teaming can offer insight to challenge prevailing views, prevent surprise, help allocate resources, and expand the bounds of imagination. Analytical Red Teaming may occur as part of a discussion-based exercise (e.g., TTX) or as a stand-alone activity. This process indoctrinates participants into the mind-set of a specific adversary, modeled upon the results of the threat analysis. Once this perspective has been viably gained, participants use it to build a threat or attack that assaults the plan(s), policy(s), or procedure(s) under examination." **(DHS**, *HSEEP*, Vol. V, p. 43)

Red Team/Red Teaming: "a technique for assessing vulnerability that involves viewing a potential target from the perspective of an attacker to identify its hidden vulnerabilities, and to anticipate possible modes of attack." (**DHS**, *The ODP Guidelines*…, 2003, Glossary, p. 3 (30)

Red Team/Red Teaming: "A group of subject-matter experts (SME), with various appropriate disciplinary backgrounds, that provides an independent peer review of plans and processes, acts as a devil's advocate, and knowledgeably role-plays the adversary, using a controlled, realistic interactive process during operations planning, training, and exercising." (**DHS**, *TOPOFF 3 FAQ,* 2005)

Red Team/Red Teaming: "Purposefully testing a system, people, and equipment to probe for weaknesses can improve their security by mimicking the techniques the adversary would use to carry out an attack. When done at the system (rather than component) level, management can identify system improvements." (**DHS**, *HSAC WEF Task Force*, January 10, 2006, p. 9)

Red Team: "The red team is a group of subject matter experts (SMEs) of various appropriate disciplinary backgrounds who provide an independent peer review of plans and processes; act as the adversary's advocate; and knowledgeably role-play the adversary, using a controlled, realistic, interactive process during operations planning, training, and exercising. In *prevention* exercises, this group of operators adapt to player decisions and actions according to the prescribed adversary's motivations and tactics, which often provide players with instant feedback." (**FEMA**, *Homeland Security Exercise & Evaluation Program Glossary*, 2008)

Red Team Handbook: "The Red Team Handbook is used solely *in operations-based prevention* exercises that employ *red teams*. This document aids red team operators, *safety*

controllers, and *evaluators* in the conduct of safe and valid red team exercise activity. It also provides essential information (not included in any other exercise documents) to red team operators, which enables them to understand their roles in exercise execution." (**FEMA**, *Homeland Security Exercise & Evaluation Program Glossary*, 2008)

Red Team Operators: "Red team operators portray the physical entity of the adversary in an *operations-based prevention* exercise. Also called the Opposition Force (OPFOR)." (**FEMA**, *Homeland Security Exercise & Evaluation Program Glossary*, 2008)

Red Zone: See "Hot Zone."

Refugees: "According to international legislation persons having a well-founded fear of persecution for reasons of race, religion, nationality, membership of a particular social group or political opinion mostly outside the country of nationality and unable to return or avail himself of the protection of that country. Includes mass exodus of peoples for reasons of conflict and natural disasters moving outside their country of origin." (**UNDHA**, *DM Glossary*, 1992, 62)

Refuges of Last Resort: "Refuges of last resort are sites that are opened when an evacuation cannot be completed. These are not shelters and will not have the same resources available to shelterees." (**New England Center for Emergency Preparedness**, *Community Planning Guide*, 2007, p. 42)

Region: "The term 'region' means—''(A) any geographic area consisting of all or parts of 2 or more contiguous States that have a combined population of at least 1,650,000 or have an area of not less than 20,000 square miles, and that, for purposes of an application for a covered grant, is represented by 1 or more governments or governmental agencies within such geographic area, and that is established by law or by agreement 1 of 2 or more such governments or governmental agencies in a mutual aid agreement; or ''(B) any other combination of contiguous local government units (including such a combination established by law or agreement of two or more governments or governmental agencies in a mutual aid agreement) that is formally certified by the Secretary as a region for purposes 9 of this Act with the consent of—''(i) the State or States in which they are located, including a multi-State entity established by a compact between two or 13 more States; and ''(ii) the incorporated municipalities, counties, and parishes that they encompass." (**US Congress**, *Implementing the 9/11 Commission Recommendations Act of 2007*, August 7, 2007)

Regional: "A region is any area that is defined as such by resident stakeholders responsible for disaster preparedness and management. A region can be a municipality, a single state (or province), or a portion of a state and may be multi-jurisdictional or cross national borders. Regions generally have certain accepted cultural characteristics and geographic boundaries and tend to coincide with the service areas of the infrastructures that serve them." (**TISP**, *Regional Disaster Resilience*, 2006, p. 2)

Regional Administrator (RA): "The new title for the executive in charge of a Regional Office of FEMA or his/her designated representative. According to the CFR, the term Regional Director (Administrator) also means the Disaster Recovery Manager who has been appointed to

exercise the authority of the FEMA Regional Administrator for a particular emergency or major disaster. *NOTE: To date, the CFR has not been updated to reflect organizational or position title changes.*" (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 25, 2007, pp. 57-58)

Regional Approach: "A multi-disciplinary, multijurisdictional group of stakeholders within the State come together to conduct a program and capability review and develop Regional/Jurisdictional Projects." Arizona Department of Homeland Security. *Arizona Department of Homeland Security: An Overview*. December 6-12, 2006, p. 5)

Regional Assistance Committees (RACs): "The Federal Radiological Preparedness Coordinating Committee (FRPCC) is an interagency body consisting of the coordinating and cooperating agencies discussed in the Radiological Incident Annex; it is chaired by DHS/FEMA. The FRPCC provides a national-level forum for the development and coordination for radiological prevention and preparedness policies and procedures. It also provides policy guidance for Federal radiological incident management activities in support of State, local and Tribal government radiological emergency planning and preparedness activities. At the Federal regional level, Regional Assistance Committees (RACs) in the DHS/FEMA Regions serve as the primary coordinating structure. RAC membership mirrors that of the FRPCC and RACS are chaired by a DHS/FEMA regional representative. Additionally, state emergency management agencies send representatives to RAC meetings and participate in regional exercise and training activities. The RACs provide a forum for information sharing, consultation, and coordination of Federal regional awareness, prevention, response, and recovery activities. The RACs provide technical assistance to State and local governments and evaluating radiological plans and exercises." (**FEMA**, *Prepared Statement of Glen Cannon*, November 15, 2007, p. 4)

Regional Catastrophic Preparedness Grant Program (RCP): "RCP provides funding to advance catastrophic incident preparedness to Tier I and designated Tier II Urban Areas Security Initiative (UASI) Jurisdictions. The goal of RCP is to support an integrated planning system that enables regional all-hazard planning for catastrophic events and the development of necessary plans, protocols, and procedures to manage a catastrophic event.

Tier 1: Chicago, Houston, Los Angeles/Long Beach, National Capital Region, Jersey City/Newark, New York, San Francisco Bay Area

Tier 2: Boston, Honolulu, Norfolk, Seattle." (**DHS**, *Fact Sheet FY08 Prepare Grants*)

Regional Collaboration National Priority:

Regional Emergency Transportation Coordinator (RETCO): "A senior-level executive from a DOT operating administration who is predesignated by DOT order to serve as the regional representative of the Secretary of Transportation for emergency transportation preparedness and response, including oversight of ESF #1. Depending upon the nature and extent of the disaster or major incident, the Secretary may designate another official in this capacity." (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 2007, p. 59)

Regional Exercise Support Program (RESP): "The National Exercise Division, in partnership with FEMA Regional Officers, announced in January [2008] the implementation of the Regional Exercise Support Program (RESP). This marked a shift in strategy from a State-

focused approach to a regional (multi-state) approach to more effectively integrate national, regional, territorial, tribal, state, and local preparedness exercises. The primary goal of the RESP is to support and promote regionally coordinated exercise initiatives. As such, it will also serve as the mechanism through which several NEP exercises will be conducted. The RESP provides exercise support teams for all phases of design, development, conduct, and evaluation of preparedness exercises. While consideration may be given to requests for support to an individual State, territorial, tribal, and/or local exercise initiatives, priority will be given to those that support collaboration within a Region. Exercise support requests must be associated with the appropriate State/territory multi-year training and exercise plans and, as they are developed, the regional multi-year training and exercise plan. These plans should incorporate broader preparedness planning such as operational plans, State Preparedness Reports and applicable outputs from various other emergency management and homeland security program planning." (**FEMA**, *National Exercise Division, Homeland Security Exercise and Evaluation Program, Quarterly Newsletter*. Washington, DC: FEMA, Spring 2008, pp. 7-8)

Regional Four Corners Homeland Security Initiative (R4C): Description: "To develop collaboration when multiple sovereign jurisdictions are co-located in the same area as is the case in the "Four Corners" region where Arizona*, Colorado, New Mexico and Utah converge with the Navajo, Hopi, Ute Mountain Ute, Southern Ute, Jicarilla Apache, and numerous Pueblo Tribal lands. The SAA in each state, Tribes, and US DHS officials have established a collaborative partnership to support planning efforts of an all hazards approach to Homeland Security for the Four Corner States.

"The R-4C was created in collaboration with the National Native American Law Enforcement Association (NNALEA) and the National Congress of American Indians (NCAI). Outcomes: The R-4C will establish a holistic planning process resulting in the creation and implementation of standardized operating procedures, consistent response plans, and development of comprehensive training and exercise programs. This model for interstate and intrastate cooperation will serve as a national blueprint for replication in other interested regions throughout the USA." (**DHS**, *Expanded Regional Collaboration…FYs 2004-2006*, 2006, p. 15)

Regional Interagency Steering Committee (RISC): "RISCs are responsible for multi-agency coordination under the NRP on a steady-state basis. The RISCs support the national-level groups by coordinating issues and solutions that are unique to the regions. RISCs also coordinate preparedness efforts with other regional-level preparedness organizations (such as the Regional Response Teams (RRTs) that coordinate regional ESF #10 efforts). At a minimum, the RISC is comprised of representatives from each State in the region and, where appropriate, regional-level representatives from ESF primary and support agencies. RISCs meet at least quarterly and provide an operational-level forum for regional planning, interagency information-sharing, and coordination. Each RISC includes an executive-level committee that meets at least twice yearly to provide executive-level guidance and oversight." (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 2007, p. 59)

Regional Military Emergency Coordinator (RMEC): "An individual, designated on behalf of the Secretary of Defense and the DoD Executive Agent, to perform coordination, information exchange, and liaison functions on behalf of the Department of Defense with any Federal

emergency management structure established at the Region level. Alternate RMECs are designated by other DoD Components, as required, in accordance with this Directive; and the RMECs and alternates collectively are referred to as "RMEC Teams." (**DoD**, *MSCA*, 1993, 22)

Regional Operations Center: "The temporary operations facility for the coordination of Federal response and recovery activities, located at the FEMA Regional Office (or Federal Regional Center) and led by the FEMA Regional Director or Deputy Director until the DFO becomes operational. Once the ERT-A is deployed, the ROC performs a support role for Federal staff at the disaster scene." (**FEMA**, *Guide For All-Hazard Emergency Ops Planning*, 1996, GLO-9)

Regional Preparedness Committee (RPC): :The primary regional organization to assist FEMA Regional Directors with implementing national preparedness policy at the regional level. It serves as the regional counterpart to the Interagency Emergency Coordinating Group (IECG) which has been established at the national level to perform coordinating functions and provide assistance to the Director, FEMA, on national emergency preparedness matters. (**USACE**, *Planning and Operations Guidelines, Annex V: Definitions and Common* Terms, 1985, p. V-4)

Regional Rapid Support and Response Team (R-RSRT). (**DHS**, *Budget-in-Brief FY2008*, 68)

Regional Response Coordination Center (RRCC): "The RRCCs Coordinate initial regional and field activities; Deploy regional teams to assess the impact of the event, gauge immediate State needs and make preliminary arrangements to set up operational field facilities; Coordinate Federal support until a JFO is established; Establish a JIC to provide a central point for coordinating emergency public information activities." (**DHS**, *NRF Comment Draft*, 2007, 42)

Regional Response Coordination Center (RRCC): "The RRCC is the regional interagency coordination center and has primary responsibility for operations until a JFO(s) is established and operational. The RRCC may support operations in several of the States in the Region and is directly involved in the coordination and issuing of mission assignments until the JFO becomes operational. Normally, the RRCC issues the mission assignments to activate the ESFs at the regional level, establish logistical and operational support facilities, and to stage teams and resources. Close coordination is maintained with the Emergency Response Team–Advanced Element (ERT–A) to ensure that any needs identified by the State are being addressed." (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 2007, p. 4; also p. 59)

Regional Response Coordination Center (RRCC): "The RRCCs are regionally-based multi-agency coordination centers that perform a complementary role to the NRCC [National Response Coordination Center, FEMA HQ]. Operating in the ten FEMA Regions, the RRCCs provide situational awareness information, identify and coordinate response requirements, perform capabilities analysis, and report on the status of Federal disaster response operations. The RRCCs deploy liaison officers and Emergency Response Teams-Advanced (ERT-A) [Emergency Response Team] to initiate Federal support, facilitate initial delivery of goods and services to save lives and property and to stabilize local infrastructures. They facilitate prioritizing "in theater" interagency resource allocation and coordination. NRCC and RRCC activations and operations are scalable and adjustable to most effectively address the nature, scope, magnitude, and potential impacts of an incident." (**FEMA**, *Statement of Cannon*, 2007, 6)

Regional Response Coordination Centers (RRCC): "A standing facility operated by DHS/EPR/FEMA that is activated to coordinate regional response efforts, establish Federal priorities, and implement local Federal program support until a JFO is established in the field and/or the PFO, FCO or FRC can assume their NRP coordination responsibilities." (**USCG**, *IM Handbook*, 2006. Glossary 25-21)

Regional Response Teams (RRT's): "Regional counterparts to the National Response Team, the RRT's comprise regional representatives of the Federal agencies on the NRT and representatives of each State within the region. The RRT's serve as planning and preparedness bodies before a response, and provide coordination and advice to the Federal OSC during response actions." (**USCG**, *IM Handbook*, 2006, Glossary 25-20/21)

Regulatory Floodway: The area regulated by federal, state or local requirements to provide for the discharge of the base flood so the cumulative increase in water surface elevation is no more than a designated amount (not to exceed one foot as set by the National Flood Insurance Program).

Regulatory Floodway: "As defined under the NFIP, the channel of a river or other watercourse and the adjacent land areas that must be reserved in order to discharge the base flood without cumulatively increasing the water surface elevation more than a designated height." (**APA**, Planning For A Disaster-Resistant Community, 2005, p. 84)

Rehabilitation: "The operations and decisions taken after a disaster with a view to restoring a stricken community to its former living conditions, whilst encouraging and facilitating the necessary adjustments to the changes caused by the disaster." (**UNDHA** *DM Glossary*, 1992, 62)

Rehearsal: The purpose of the rehearsal is to ensure that all participants understand their tasks and to identify any changes that need to be made prior to execution of the plan. CONPLANs and OPLANs may or may not lend themselves to conducting a rehearsal. (**DHS**, 2007)

Reinsurance: Insurance for insurance companies. (**GAO**, *Natural Disasters: Public Policy Options*…, Nov. 2007, p. 12)

RELATIVE RISK ANALYSIS: "**RELATIVE RISK ANALYSIS** means that a risk is evaluated in comparison to another risk. The type of risk analysis used should be appropriate for the available data and to the exposure, frequency and severity of potential loss." (**DOT**, *Risk Management Definitions*, Office of Hazardous Materials Safety, 2005)

RELIDO: "Releasable by Information Disclosure Officer." (**FEMA** *IIFOG Ver 3 Draft*, `08, 35)

Relief: Assistance and/or intervention during or after disaster to meet the life preservation and basic subsistence needs. It can be of emergency or protracted duration. (**UNDHA,** *DM Glossary* 1992, 63)

Relief: "The provision of assistance during or immediately after a disaster to meet the life preservation and basic subsistence needs of those people affected. It can be of

an immediate, short-term, or protracted duration." (**World Health Organization**, *Mass Casualty Management* Systems, April 2007, p. 31)

REM: Roentgen Equivalent Man. "A unit of biological dose of radiation… The number of rems of radiation is equal to the number of rads absorbed multiplied by the RBE of the given radiation (for a specified effect). The rem is also the unit of dose equivalent, which is equal to the product of the number of rads absorbed and the 'quality factor' of the radiation." (**Glasstone**, *The Effects of Nuclear Weapons*, 3rd Ed., 1977, Glossary, p. 638)

Remedial Action Management Program (RAMP): A "program that will identify and remedy operational and programmatic issues encountered in disaster response and recovery operations and exercises…. it will also capture lessons learned and smart practices that will become part of a Web-based national library accessible to all levels of government…. The RAMP replaces the Disaster Corrective Action Program and involves restructured procedures and new issue-management authorities." (FEMA, *New Remedial Action Management Program Launched*. Press Release, July 23, 2003)

Remediation: "Actions taken to correct known deficiencies and weaknesses. These actions are undertaken once a vulnerability has been identified." (**DoD**, *DCIP*, DODD 3020.40, 2005, p. 13)

Remote Sensing: "Remote sensing refers to the process of recording information from sensors mounted either on aircraft or on satellites. The technique is applicable to natural hazards management because nearly all geologic, hydrologic, and atmospheric phenomena are recurring events or processes that leave evidence of their previous occurrence. The benefits of the technique are that revealing the location of previous occurrences and/or distinguishing the conditions under which they are likely to occur makes it possible to identify areas of potential exposure to natural hazards. It additionally provides comprehensive displays of disaster information to assess vulnerability, enhance mapping, and monitor threatened areas. The limitations of the technique include the requirement for expert science writers and graphics designers to translate and package the resulting information into images and explanations that can be easily understood by a wide variety of users; and while space technology has advanced rapidly in recent years, a number of countries still lack the human, technical and financial resources required to conduct even the most basic space-related activities." (**UNDAP**, *Techniques Used in Disaster Risk Assessment*, 2008)

Remote Sensing: "The observation and/or study of an area, object or phenomenon from an aerial distance, frequently using data collected by satellite." (**UNDHA**, *DM Glossary*, 1992, 63)

REMS TA Center: Readiness and Emergency Management for Schools Technical Assistance Center, DOE.

Reorganization Plan No. 1 of 1958: Sent by President Eisenhower to Congress on April 24, 1958. Transferred all responsibilities of the Federal Civil Defense Administrator and of the Director of the Office of Defense Mobilization to the President, who consolidated the FCDA and ODM into the new Office of Defense and Civilian Mobilization in the Executive Office of the President. Became law on July 1, 1958. (**Gessert**, *Federal Civil Defense Organization*, 1965, p. 70)

REP: Radiological Emergency Preparedness.

Repetitive Flood Claims (RFC) Grant Program: "The Repetitive Flood Claims (RFC) grant program provides funding to reduce or eliminate the long-term risk of flood damage to structures insured under the National Flood Insurance Program (NFIP) that have had one or more claim payments for flood damages. RFC funds may only mitigate structures that are located within a State or community that can not meet the requirements of the Flood Mitigation Assistance (FMA) program for either cost share or capacity to manage the activities. The long-term goal of the RFC program is to reduce or eliminate flood claims under the NFIP through mitigation activities that are in the best interest of the National Flood Insurance Fund (NFIF)." (**FEMA**, *Repetitive Flood Claims Program Guidance* (Fiscal Year 2008), October 30, 2007, p. 4)

Repetitive Loss: "Under the National Flood Insurance Program, the payment of at least $1,000 twice or more since 1978 for flood damages to the same property. Thus, such a property would be a repetitive loss property; a community with one or more such properties is a repetitive loss community. Repetitive loss projects are mandatory for such communities when participating in CRS." (**APA**, *Planning For A Disaster-Resistant Community*, 2005, p. 84)

Repetitive Loss: "Repetitive loss refers to an NFIP-insured property where two or more claim payments of more than $1,000 have been paid within a 10-year period since 1978. About 20 to 25 percent of repetitive loss properties are rated as being in B, C, or X Zones." (FEMA, *Reducing Damage from Localized Flooding – A Guide for Communities*, 2005, viii)

REPM: Regional Emergency Planning Model. (**ORNL**, *SERRI Research*. REPM, 2007)

Reportable Quantity (RQ): "The quantity of a hazardous substance that triggers reporting under CERCLA; if a substance is released in a quantity that exceeds its RQ, the release must be reported to the National Response Center (NRC), as well as to the State emergency response commission (SERC) and the community emergency coordinator for areas likely to be affected by the release." (**EPA**, *Technical Guidance for Hazards Analysis*, 1987, p. A-7)

REPP: Radiological Emergency Preparedness Program.

RERO: Radiological Emergency Response Operations. (**FEMA**, *Compendium of Federal Terrorism Training Courses*, 2003, p. 290)

Rescue Street: In 1952 the civil defense training center in Olney, MD "was reorganized and equipped for basic and advanced rescue training for wardens, firemen, and rescue squads…. Trainees learn rescue methods and perform actual rescue operations in five buildings build to duplicate conditions of collapse or ruin such as might result from enemy attack or natural disaster…Exercised performed by the students include rescue of 'victims' from upper stories of multistory buildings, from flooded basements, and from beneath collapsed floors and piles of rubble. Rescue methods under special hazards such as fire and exposed live electric wires also are studied." (**FCDA**, *Annual Report for 1952*, p. 69)

R-ESFs: Regional Emergency Support Functions.

Residual Capability Assessment (RECA): "An assessment of the effects of a nuclear or conventional attack on U.S. resources, or of a major peacetime disaster that results in the declaration of a national security emergency. Such an assessment is made (through all appropriate means) to determine the remaining capabilities of the United States with emphasis on military preparedness." (**DoD**, *MSCA* (Directive 3025.1), 1993, p. 22)

Residual Market Facilities (Insurance): "The intensity and frequency of hurricanes has led some states to establish certain insurance facilities to fund hurricane losses. Some of these facilities provide primary coverage directly to homeowners who cannot or will not purchase coverage from private insurers in the 'voluntary market.' These state-sponsored plans are known as 'residual markets' facilities."[112] (**FinancialServicesRoundtable**, *Nation Unprepared* 2007,46)

"There are at least two policy problems posed by these facilities, however. One issue relates to the fact that residual market insurers tend to offer catastrophe coverage at subsidized rates, which means that states (and thus taxpayers) can be frequently called upon to pay a portion of the claims losses that exceed the insurer's reserves. In addition, subsidized rates reduce incentives for mitigation (since they typically do not reward such investments with actuarially appropriate insurance premium discounts). A second issue is one of fairness: typically, anyone can purchase insurance from the residual facility, which in the past has meant that some homeowners who could easily afford coverage in the voluntary market have been able to take advantage of subsidized rates in the residual market." (Ibid, p. 49)

Residual Nuclear Radiation: "Nuclear radiation, chiefly beta particles and gamma rays, which persists for some time following a nuclear (or atomic) explosion. The radiation is emitted mainly by the fission products and other bomb residues in the fallout, and to some extent by earth and water constituents, and other materials, in which radioactivity has been induced by the capture of neutrons." (**Glasstone**, *The Effects of Nuclear Weapons*, 3rd Ed., 1977, Glossary, p. 638)

Residual Risk: "Risk remaining after risk treatment." (**ISO 22399**, *Societal Security*, 2007, 5)

Resilience: "Resiliency is defined as the capability of a system to maintaining its functions and structure in the face of internal and external change and to degrade gracefully when it must." (**Allenby and Fink** 2005, 1034)

Resilience: "Resilience refers to the capability to prevent or protect against significant multihazard threats and incidents and to expeditiously recover and reconstitute critical services with minimum damage to public safety and health, the economy, and national security." (**American Society of Civil Engineers**, *Critical Infrastructure Definitions*, 2006)

Resilience: "…the ability of social units (e.g., organizations, communities) to mitigate hazards, contain the effects of disasters when they occur, and carry out recovery activities in ways that minimize social disruption and mitigate the effects of future disasters." (**Bruneau**, et al, *A Framework to Quantitatively Assess and Enhance… Seismic Resilience…*, 2003)

---

[112] See Florida Hurricane Catastrophe Fund (FHCF) as an example.

Resilience: The capacity to recover successfully from loss and damage. The central features of resilience appear to be access to resources (particularly finance), access to information and services, the capacity to manage one's own affairs and the capacity to deal with the stress and emotions generated by the disaster. (**Buckle** 1995, 13)

Resilience: "The capacity of a system, community or society potentially exposed to hazards to adapt, by resisting or changing in order to reach and maintain an acceptable level of functioning and structure." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 57)

Resilience: "Coutu's review of the resilience literature[113] suggests that there are three key elements to resilience: (1) "a staunch acceptance of reality," "a deep belief, often buttressed by strongly held values, that life is meaningful," and "an uncanny ability to improvise."" (Light, *Predicting Organizational Crisis Readiness: Perspectives and Practices toward a Pathway to Preparedness*, 2008, p. 16)

Resilience: "…a dictionary definition [Merriam-Webster Online Dictionary] for 'resilience' is: 'an ability to recover from or adjust easily to misfortune or change'. Strategies based on resilience accept that efforts to prevent attacks (reduce threats) and to defend against those attacks (reduce vulnerabilities), albeit necessary, will inevitably prove insufficient. Strategies based on resilience address all three components of the risk equation in an integrated fashion." (**Critical Infrastructure Task Force** 2006, 4-5).

Resilience: "Definition: the ability to recover from, or adjust to, adversity or change. "Extended definition: the ability of systems, infrastructures, government, business, and citizenry to absorb and/or quickly recover from an adverse event or series of events caused by attack or natural disaster which may cause harm, destruction, or loss of national significance and to restore minimum essential operations and reduce the consequences of its degradation or failure regardless of its cause. "Annotation: Resilience is determined by the degree to which the social system is capable of organizing itself to increase its capacity for learning from past disasters for better future protection and to improve risk reduction measures. Includes: 1) immediate efforts to coordinate, execute, and plan to restore operations and services for various reasons, and 2) immediate evaluation of an incident to identify lessons learned, post incident reporting and development of initiatives to mitigate the effects of future incidents. (**DHS**, *Lexicon*, October 19, 2007, p. 23)

Resilience: Question: "The House Homeland Security Committee has devoted its hearings to the subject of resilience and has had a number of hearings so far. Would you have a comment - I don't think you've testified or were intending to testify on this - the department has offered some comments on resilience being either one of two things: part and parcel the strategy as it already is or actually a distraction from what's more important, and that is focusing on prevention and emergency response.

Secretary Chertoff: Resilience is part of the strategy because resilience is part of response and what resilience means - let's go back to having the food and water. Having the food and water,

[113] Diane L. Coutu, "How Resilience Works," *Harvard Business Review* 80, no. 5 (2002): 46–51.

having the capability to sustain yourself until things get better, that is resilience. Backing up your records on a back-up server is resilience. Having the capability to replace power lines that are down or having a back-up generator, that's resilience. That is something that is at the core of what we think is an appropriate response. I remember a couple of years ago in the latter of 2006 I wrote - the Secretary of Energy and I wrote the CEOs of the various oil companies and said to them you really have the responsibility to make sure that your distributors, your franchisees have generators at the gas stations so when the power goes down you can start up the gas pumps, fill up the trucks so the workers can go to the power plants so they can start the power up again. So we have always viewed resiliency as an important part of the strategy. That doesn't mean you don't try to prevent. It just means that you recognize that 100 percent prevention is not something that you can count on. (**DHS**, *Remarks by… Chertoff... at a Blogger Roundtable.…*, 20May2008)

Resilience: "…Resilience is key [to a determination of vulnerability] since it refers to our coping capacity to absorb events, adapt, and respond to and recover from its effects." (**DHS**, *TCL*, 2007, p. 13)

Resilience: "The ability of an organization to absorb the impact of a business interruption, and continue to provide a minimum acceptable level of service." (**DigitalCare**, *State of Oregon Business Cont. Workshop*, 2006, p. 62)

Resilience: "In this Code, the word 'Resilience' is to be interpreted in the broadest sense as the ability of an organization, resource or structure to be resistant to a range of internal and external threats, to withstand the effects of a partial loss of capability and to recover and resume its provision of service with the minimum reasonable loss of performance." (**Electronic Communications Resilience & Response Group.** *EC-RRG Resilience Guidelines for Providres of Critical National Telecommunications Infrastructure*. June 3, 2008, p. 3)

Resilience: "Defined as the ability of a system to withstand to and recover from adversity, resilience is increasingly applied to larger social and technical systems. Stress and adversity are experienced not only by individuals and groups, but also by organizations and institutions. In the context of increasing natural and man-made threats and vulnerabilities of modern societies, the concept seems particularly useful to inform policies that mitigate the consequences of such events." (**George Mason University** School of Law, CIPP, *Critical Thinking: Moving from Infrastructure Protection to Infrastructure Resilience*, May 2006)

Resilience: "The ability at every level to detect, prevent, prepare for and if necessary handle and recover from disruptive challenges." (**Great Britain** 2004, 1)

Resilience: "Ability of an organization to resist being affected by an event." (**ISO 22399**, *Societal Security.…*, 2007, 5)

Resilience: "Simply stated, resilience is the ability to rapidly respond to and recover from a catastrophic event…Enhancing resilience recognizes that not every disaster can be averted. It is imperative that our national security policy place as much attention to resilience as it does to prevention so that we employ the proper resources towards preparedness and contingency planning." (**Kelly, Robert W**., *Reform Institute Applauds Congressional Focus*…, May 6, 2008)

Resilience: "Resilience: a community or region's capability to prepare for, respond to, and recover from significant multi-hazard threats with minimum damage to public safety and health, the economy, and national security.
•Prevents and mitigates cascading failures, often characteristic of critical infrastructure impacts
•Minimizes disruption to life and economies." (**ORNL**, *SERRI) Community and Regional Resilience Initiative: Resilient Communities, Resilient Regions* (Slide Pres.), 13Aug07, slide 3)

Resilience: "Resilience as a concept was initially used in ecology to describe the ability of ecosystems to resist and recover from external negative impacts (Blaikie and Brookfield, 1985). The term is increasingly used in the disaster management sphere and reflects a trend towards a holistic and proactive approach that has the community, and its ability to resist and recover as its focus. The term resilience brings together the components of the disaster cycle – response, recovery, mitigation and preparedness, utilizing a range of structural and non-structural approaches." (**O'Brien and Read** 2005, 354)

Resilience: "In examining the attributes and determinants of resilience, MCEER investigators [Bruneau et al, above] developed the R4 framework of resilience:

- *Robustness* – the ability of systems, system elements, and other units of analysis to withstand disaster forces without significant degradation or loss of performance;
- *Redundancy* – the extent to which systems, system elements, or other units are substitutable, that is, capable of satisfying functional requirements, if significant degradation or loss of functionality occurs;
- *Resourcefulness* – the ability to diagnose and prioritize problems and to initiate solutions by identifying and mobilizing material, monetary, informational, technological, and human resources; and
- *Rapidity* – the capacity to restore functionality in a timely way, containing losses and avoiding disruptions." (**Tierney and Bruneau**, 2007, p. 15)

Resilience: "Many attempts have been made to define 'resilience'. The variety of academic definitions and concepts can be confusing. For operational purposes it is more useful to work with broad definitions and commonly understood characteristics. Using this approach, system or community resilience can be understood as:

- capacity to absorb stress or destructive forces through resistance or adaptation
- capacity to manage, or maintain certain basic functions and structures, during disastrous events
- capacity to recover or 'bounce back' after an event.

'Resilience' is generally seen as a broader concept than 'capacity' because it goes beyond the specific behaviour, strategies and measures for risk reduction and management that are normally understood as capacities. However, it is difficult to separate the concepts clearly. In everyday usage, 'capacity' and 'coping capacity' often mean the same as 'resilience'.

A focus on resilience means putting greater emphasis on what communities can do for themselves and how to strengthen their capacities, rather than concentrating on their vulnerability to disaster or their needs in an emergency.

The terms 'resilience' and 'vulnerability' are opposite sides of the same coin, but both are relative terms. One has to ask what individuals, communities and systems are vulnerable or resilient to, and to what extent." (**Twigg**, *Characteristics of a Disaster-resilient* Community, August 2007, p. 6)

Resilience: "UK doctrine which centres on the ability to handle disruptive challenges that can lead to crisis, and withstand the consequences of any terrorist incident or disaster, e.g. by sustaining services in spite of damage. Resilience is underpinned by extensive preparation, including scenario exercises." (**UK Cabinet Office**, *Media Emergency Forum: Joint Glossary of Official and Media Terms and* Acronyms, August 2004, p. 19)

Resilience: "The ability of the community, services or infrastructure to withstand the consequences of an incident. (Cabinet Office: '*Emergency Preparedness/Emergency Response and Recovery*')." (**UK**, Chiefs of Staff. *Joint Doctrine Publication 02 (2nd Ed.): Operations in the UK: The Defence Contribution to Resilience*. September 2007, lexicon-13)

Resilience/Resilient: "The capacity of a system, community or society to resist or to change in order that it may obtain an acceptable level in functioning and structure. This is determined by the degree to which the social system is capable of organizing itself, and the ability to increase its capacity for learning and adaptation, including the capacity to recover from a disaster." (**UN/ISDR** 2002, 24)

Resilience, Business: "The ability to rapidly adapt and respond to risks and opportunities in order to maintain continuity of business operations, remain a trusted partner and enable growth." (**iJET** Intelligent Risk Systems, "Business Resiliency for the Global Marketplace: Transorming Operating Risk into Competitive Advantage," 2008)

Resiliency: "Resiliency is defined as the capability of a system to maintain its functions and structure in the face of internal and external change and to degrade gracefully when it must."[114] (**DHS**, *Critical Infrastructure Task Force Presentation to HSAC,* January 10, 2006, slide 7)

Resiliency: "In the context of the NIPP, resiliency is the capability of an asset, system, or network to maintain its function during or to recover from a terrorist attack or other incident." (**DHS, NIPP** 2006, p. 104)

Resiliency, Coastal: "Coastal resiliency refers to the ability of coastal cities, towns, and communities to adapt and recover from natural hazards, including hurricanes, tsunamis, floods, and disease epidemics." (**Abbott**, "Floods, Flood Insurance, Litigation, Politics," 2008, p. 129)

Resilient Community: "A resilient community is prepared to help prevent or minimize the loss or damage to life, property and the environment and more quickly return citizens to work, reopen

[114] Cites *Science*, August 12, 2005.

businesses, and restore essential services needed for a full and swift economic recovery." (**ORNL**, "ORNL 'Resilience Plan to Help TN, Miss., SC Communities Beat Disaster." 4Oct07)

Resistance: "The ability to resist or withstand impacts so that inevitable damage from an extreme event does not reach 'disastrous' proportions." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 57)

Resistance, Disaster: "Disaster resistance emphasizes the importance of predisaster mitigation measures that enhance the performance of structures, infrastructure elements, and institutions in reducing losses from a disaster." (**Tierney and Bruneau**, "Conceptualizing and Measuring Resilience," *TR News*, May/June 2007, p. 14) [Note: See "Resilience.]

Resource Analysis: The systematic identification and analysis of available resources and authorities for managing these potential resources in an emergency.

Resource Conservation and Recovery Act (RCRA), 1976: "First enacted by Congress in 1976, RCRA established the "cradle to grave" regime for tracking toxic and hazardous substances from their manufacture to their transport to their usage to their disposal. Its orientation is thus on the present and future management of such substances, and it devolves a very substantial amount of implementation and enforcement authority to state government." (**Burton**, "The Constitutional Roots of All-Hazards Policy, Management…" 2008, p. 12)

Resource Evaluation: "Resource evaluation (formerly termed 'damage assessment') is a process of determining the effects of enemy attack uopon the human and material resources of the Nation and establishing the amount and location of the remaining resources so that intelligent decisions for the survival and recovery of the Nation can be made. Both electronic and manual methods are used in thes process. The National Resource Evaluation Center (formerly the National Damage Assessment Center), with its electronic computers and associated machine techniques, is designed to provide the most urgent needs of the Federal agencies for preattack estimates of attack hazards and postattack estimates of resource status." (**OCDM**, *Annual Report 1960*, p. 18)

Resource Management: "Coordination and oversight of tools, processes, and systems that provide incident managers with timely and appropriate resources during an incident…. Resources are defined as personnel and major items of equipment supplies, and facilities available for assignments to incident operations and for which status is maintained." (**DHS**, *UTL 2.1*, 2005, p. 14)

Resource Management: "Efficient emergency management and incident response requires a system for identifying available resources at all jurisdictional levels to enable timely and unimpeded access to resources needed to prepare for, respond to, or recover from an incident. Resource management under NIMS includes mutual aid agreements and assistance agreements; the use of special Federal, State, tribal, and local teams; and resource mobilization protocols." (**FEMA**, *National Incident Management System* (FEMA 501/Draft), August 2007, p. 157)

Resource Management: (NIMS 2005-2006): 3rd of five Compliance Assessment Metrics. "Resource management involves coordinating and overseeing the application of tools, processes

and systems that provide incident managers with timely and appropriate resources during an incident." (**FEMA**, *NIMSCAST Technical Users Guide Version 1.1*. April 30, 2007, p. 28)

Resource Management: "Resource management involves the systematic development of methodologies for the prompt and effective identification, acquisition, distribution, accounting, and use of personnel and major items of equipment for essential emergency functions." (**Idaho Bureau of Disaster Services**. *Local Capability Assessment for Readiness (CAR) Version 2*. January 2000, p. 5)

Resource Management: "A system for identifying available resources to enable timely and unimpeded access to resources needed to prevent, mitigate, prepare for, respond to, or recover from an incident." (**NFPA 1600**, 2007, p. 8)

A.5.6 The five key principles of resource management that underpin effective resource management are as follows:
(1) Advance Planning. Entities work together in advance of an incident to develop plans for managing and employing resources in a variety of possible emergency circumstances.
(2) Resource Identification and Ordering. Entities use standardized processes and methodologies to order, identify, mobilize, dispatch, and track the resources required to support incident management activities.
(3) Categorizing Resources. Resources are categorized by size, capacity, capability, skill, and other characteristics.
(4) Use of Agreements. Mutual aid/assistance agreements and pre-incident agreements among all parties providing or requesting resources are necessary to enable effective and efficient resource management during incident operations.
(5) Effective Management of Resources. Resource managers use validated practices to perform the following key resource management tasks systematically and efficiently:
(a) Acquisition Procedures. Used to obtain resources to support operational requirements.
(b) Management Information Systems. Used to collect, update, and process data; track resources; and display their readiness status.
(c) Ordering, Mobilization, Dispatching, and Demobilization Protocols. Used to request resources, prioritize requests, activate and dispatch resources to incidents, and return resources to normal status.

To the extent practical and feasible, an entity should type resources according to established definitions, such as utilizing the Department of Homeland Security/FEMA's National Mutual Aid and Resource Management Initiative Resource Type Definitions.

Resources for program administration as well as emergency operations should be specifically identified. These resources include, but are not limited to, the following:
(1) The locations, quantities, accessibility, operability, and maintenance of equipment (heavy duty, protective, transportation, monitoring, decontamination, response, personal protective equipment)
(2) Supplies (medical, personal hygiene, consumable, administrative, ice)
(3) Sources of energy (electrical, fuel)
(4) Emergency power production (generators)

(5) Communications systems
(6) Food and water
(7) Technical information
(8) Clothing
(9) Shelter
(10) Specialized personnel (medical, religious, volunteer organizations, emergency management staff, utility workers, morticians, and private contractors)
(11) Specialized volunteer groups [Red Cross, amateur radio, religious relief organizations, charitable agencies, VOAD (Volunteer Organization Active in Disaster), COAD (Community Organization Active in Disaster), CERT (Community Emergency Response Team)]
(12) External federal, state, provincial, tribal, territorial, and local agencies A resource should be available in a timely manner and should have the capability to do its intended function. Restriction on the use of the resource should be taken into account, and application of the resource should not incur more liability than would failure to use the resource. Finally, the cost of the resource should not outweigh the benefit." (**NFPA 1600**, 2007, pp.15-16)

Resource Mangement: "Resource management is the governmental control of the distribution, allocation, conservation, and use of essential resources and services in an emergncy so that they may be assigned to top priority activities." (**OEP**, *Organization and Planning Guide for State & Local Emergency Management of Resources*, September 1962, page 2)

Resource Management Concepts and Principles in DHS: "The core concepts and principles of resource management as taught by DHS (and as defined in the NIMS Document) incorporate the following components: Resource management involves coordination and overseeing the application of tools, processes, and systems that provide incident managers with timely and appropriate resources during an incident. Resources include personnel, teams, facilities, equipment, and supplies. Resource management involves the four primary tasks noted below.

- The establishment of systems for describing, inventorying, requesting, and tracking resources.
- The activation of these systems prior to and during an incident.
- The dispatching of resources prior to and during an incident.
- The deactivating or recalling of resources during or after an incident.

The underlying concepts that shall be included in NIMS resources management training include the following:

- Resource management provides a uniform method of identifying, acquiring, allocating, and tracking resources.
- Resource management uses effective mutual-aid and donor assistance and is enable by the standardized classification of kinds and types of resources required to support the incident management organization.
- Resource management uses a credentialing system tied to uniform training and certification standards to ensure the requested personnel resources are successfully integrated into on-going incident operations.

- Resource management coordination is the responsibility of the EOCs and/or multi-agency coordination entities, as well as specific elements of the ICS structure (e.g., the Resources Unit).
- Resource management should encompass resources contributed by the private-sector and non-governmental organizations.
- Training dealing with NIMS resource management shall describe to participants the components of resource management and establish relationships between all elements of resource management with the multi-agency coordination system under NIMS." (FEMA, *National Incident Management System National Standard Curriculum Training Development Guidance*, October 2005, pp. 25-26)

Resource Management Objectives: "…resource management objectives established shall include the following: (1) Personnel, equipment, training, facilities, funding, expert knowledge, materials, technology, information, intelligence, and the time frames within which they will be needed (2) Quantity, response time, capability, limitations, cost, and liability connected with using the involved resources (3) Resources and any needed partnership arrangements essential to the program." (**NFPA 1600**, 2007, p. 8)

Resource Management Tasks: "Resource management shall include the following tasks:
(1) Establishing processes for describing, inventorying, requesting, and tracking resources
(2) Activating these processes prior to and during an incident
(3) Dispatching resources prior to and during an incident
(4) Deactivating or recalling resources during or after incidents
(5) Contingency planning for shortfalls of resources." (**NFPA 1600**, 2007, p. 8)

Resource Tracking: "A standardized, integrated process conducted prior to, during, and after an incident by all emergency management/response personnel and their associated organizations." (**FEMA**, *National Incident Management System Draft*, August 2007, p. 157)

Resource Typing: "Resource typing is the categorization and description of response resources that are commonly exchanged in disasters through mutual aid agreements. Use of these standard definitions enables emergency management personnel to identify, locate, request, order, and track outside resources quickly and effectively and facilitate the response of these resources to the requesting jurisdiction." (**DHS**, *TCL*, 2007, p. 8)

Resource Typing: "Categorizing by capability the resources that incident managers commonly request, deploy, and employ. Measurable standards identifying the capabilities and performance levels of resources serve as the basis for categories. Resource users at all levels identify these standards and then type resources on a consensus basis, with a national-level entity taking the coordinating lead. Resource kinds may be divided into subcategories (types) to define more precisely the resource capabilities needed to meet specific requirements. Resource typing is a continuous process designed to be as simple as possible to facilitate frequent use and accuracy in obtaining needed resources. To allow resources to be deployed and used on a national basis, the NIMS Integration Center is responsible for defining national resource typing standards." (**DHS**, *The National Incident Management System*, March 2004, pp. 45-46.)

Resource Typing: "Resource typing is categorizing, by capability, the resources requested, deployed, and used in incidents. Measurable standards identifying the capabilities and performance levels of resources serve as the basis for categories. Resource users at all levels utilize these standards to identify and inventory resources. Resource kinds may be divided into subcategories to define more precisely the resource capabilities needed to meet specific requirements. Resource typing is a continuous process designed to be as simple as possible to facilitate frequent use and accuracy in obtaining needed resources. To allow resources to be deployed and used on a national basis, the NIC (with input from Federal, State, tribal, local, private sector, NGOs, and national professional organizations) is responsible for facilitating the development and issuance of national standards for the typing of resources and ensuring that these typed resources reflect operational capabilities." (**FEMA**, *NIMS Draft*, Aug. 2007, p. 41)

Resource Typing (Measures): "Measures are standards. The measures used will depend on the kind of resource being typed. The mission envisioned determines the specific measure selected. The measure must be useful in describing a resource's capability to support the mission. Measures should identify capability and/or capacity. As an example, one measure for a disaster medical assistance team is the number of patients it can care for per day. An appropriate measure for a hose might be the number of gallons of water per hour that can flow through it." (**FEMA**, *National Incident Management System* (FEMA 501/Draft), August 2007, p. 42)

Resource Typing (National Categories):

Transportation
Communications
Public Works and Engineering
Firefighting
Information and Planning
Law Enforcement and Security
Mass Care
Resource Management
Health and Medical
Search and Rescue
Hazardous Materials Response
Food and Water
Energy
Public Information
Animals and Agricultural Issues
Volunteers and Donations

(**FEMA**, *National Incident Management System* (**FEMA** *501/Draft*), August 2007, p. 41)

Resource Typing Standards: "Categorization and description of response resources that are commonly exchanged in disasters through mutual aid agreements. The FEMA/NIMS Integration Center Resource typing definitions provide emergency responders with the information and terminology they need to request and receive the appropriate resources during an emergency or disaster." (**FEMA**, *NIMS Compliance Metrics Terms of Reference* (FY 2007), Oct. 23, 2006, p8)

Resources: "The personnel and major items of equipment that are available or potentially available for assignment to incident tasks on which status is maintained. (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 57)

Resources Unit: "The unit within the Planning Section responsible for recording the status of resources that are committed to the incident." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 57)

RESP: Regional Exercise Support Program, FEMA, National Exercise Division.

Respond: "Response operations are those taken in advance of and upon the onset of an incident to save lives, protect property, and meet basic human needs. They are tiered efforts designed to be managed at the lowest possible jurisdictional level and supported by additional response capabilities when needed. During major incidents with significant consequences, DHS plays a leadership role in ensuring that State and local community response efforts receive the support they need to achieve their objectives." (**DHS**, *Capstone Doctrine Pub 1 Draft*, Ch. 2, 2008, 2-6)

Respond: "Activities that address the short-term, direct effects of an incident. Response includes immediate actions to save lives, protect property, and meet basic human needs. Response also includes the execution of emergency operations plans and of mitigation activities designed to limit the loss of life, personal injury, property damage, and other unfavorable outcomes. As indicated by the situation, response activities include applying intelligence and other information to lessen the effects or consequences of an incident; increased security operations; continuing investigations into nature and source of the threat; ongoing public health and agricultural surveillance and testing processes; immunizations, isolation, or quarantine; and specific law enforcement operations aimed at preempting, interdicting, or disrupting illegal activity, and apprehending actual perpetrators and bringing them to justice (Source—NIMS, March 2004)." (**DHS/ODP**, *State and Urban Area Homeland Security Strategy Guidance on Aligning Strategies with the NPG*, 2005, p. 4)

Respond: "Definition of Respond: Implement immediate actions to save lives, protect property, and meet basic human needs." (**DHS**, *Universal Task List 2.1*, 2005, p. 61)

Respond to Hazard: "Definition: Reduce or eliminate risks to persons or to lessen the actual or potential effects or consequences of an incident, including removing contamination to acceptable levels from individuals, animals, equipment, and facilities." (**DHS**, *UTL 2.1*, 2005, p. 73)

Responder Knowledge Base (RKB): "Created to provide Emergency Responders, purchasers, and planners with a trusted, integrated, on-line source of information on products, standards, certifications, grants, and other equipment-related information."

"The RKB is funded through the FEMA National Preparedness Directorate, U.S. Department of Homeland Security (DHS). The RKB features data items from other DHS-sponsored sites, such as the System Assessment and Validation for Emergency Responders (SAVER) site, the Lessons Learned Information Sharing (LLIS) system, and the ANSI Homeland Security Standards Database (HSSD). (RKB, 2008. https://www.rkb.us/)

Response: "Response includes activities to address the immediate and short-term actions to preserve life, property, environment, and the social, economic, and political structure of the community. Response activities include:

1. Emergency shelter, housing, food, water and ice;
2. Search and rescue;
3. Emergency medical and mortuary services;
4. Public health and safety;
5. Decontamination following a chemical, biological or radiological attack;
6. Removal of threats to the environment;
7. Emergency restoration of critical services (electric power, water, sewer, telephone);
8. Transportation, logistics, and other emergency services;
9. Private sector provision of needed goods and services through contracts or donations; and
10. Secure crime scene, investigate and collect evidence." (**DHS**, *National Response Plan* (Draft #1), February 25, **2004**, p. 16)

Response: "Activities that address the short-term, direct effects of an incident, including immediate actions to save lives, protect property, and meet basic human needs. Response also includes the execution of emergency operations plans and incident mitigation activities designed to limit the loss of life, personal injury, property damage, and other unfavorable outcomes. As indicated by the situation, response activities include applying intelligence and other information to lessen the effects or consequences of an incident; increased security operations; continuing investigations into the nature and source of the threat; ongoing surveillance and testing processes; immunizations, isolation, or quarantine; and specific law enforcement operations aimed at preempting, interdicting, or disrupting illegal activity, and apprehending actual perpetrators and bringing them to justice." (**DHS**, *NIMS*, 2004, p. 136; **DHS,** *National Infrastructure Protection Plan*, **2006**, pp. 104-105)

Response: "Activities that address the short-term, direct effects of an incident. Response includes immediate actions to save lives, protect property, and meet basic human needs. Response also includes the execution of emergency operations plans and of mitigation activities designed to limit the loss of life, personal injury, property damage, and other unfavorable outcomes. As indicated by the situation, response activities include applying intelligence and other information to lessen the effects or consequences of an incident; increased security operations; continuing investigations into nature and source of the threat; ongoing public health and agricultural surveillance and testing processes; immunizations, isolation, or quarantine; and specific law enforcement operations aimed at preempting, interdicting, or disrupting illegal activity, and apprehending actual perpetrators and bringing them to justice." (**DHS**, *National Preparedness Goal*, December 2005 draft, p. A-3 (citing *NIMS*, March 2004); also **HHS**, *Medical Surge Capacity and Capability Handbook*, August 2004, p. D-10, Glossary (citing **DHS**, *NPG*; **FEMA**, *NIMS Draft*, August 2007, p. 157)

Response: "The term 'response' as used in this *Framework* includes immediate actions to save lives, protect property and meet basic human needs. Response also includes the execution of emergency operations plans, actions to support short-term recovery and some short-term mitigation activities. The *Framework* is always in effect and can be implemented as needed on a flexible, scalable basis that can help improve response. Response does not include prevention, protection or long-term recovery and restoration activities needed by communities to rebuild their way of life." (**DHS**, *National Response Framework* Comment Draft, September **2007**, p. 7)

Response: "The term "response" as used in this *Framework* includes immediate actions to save lives, protect property and the environment, and meet basic human needs. Response also includes the execution of emergency plans and actions to support short-term recovery. The *Framework* is always in effect, and elements can be implemented as needed on a flexible, scalable basis to improve response." (**DHS,** *NRF*, Jan 2008, 1)

Response: "The reaction to an incident or emergency to assess the damage or impact and to ascertain the level of containment and control activity required. In addition to addressing matters of life safety and evacuation, Response also addresses the policies, procedures and actions to be followed in the event of an emergency. . SIMILAR TERMS: Emergency Response, Disaster Response, Immediate Response, and Damage Assessment." (**DigitalCare**, *State of Oregon Business Continuity Workshop*, 2006, p. 62)

Response: "The efforts to minimize the risks created in an emergency by protecting the people, the environment, and property, and the efforts to return the scene to normal pre-emergency conditions." (**EPA**, *Technical Guidance for Hazards Analysis*, 1987, p. A-7)

Response: "Conducting emergency operations to save lives and property, including positioning emergency equipment and supplies; evacuating potential victims; providing food, water, shelter, and medical care to those in need; and restoring critical public services." (**FEMA**, *A Nation Prepared – FEMA Strategic Plan – Fiscal Years 2003-2008*, **2002**, p. 59 (Glossary))

Response: "Those activities and programs designed to address the immediate and short-term effects of the onset of an emergency or disaster." (**FEMA**, *Federal Response Plan*, 1992; See also, **USG** *CONPLAN*, 2001))

Response: "The Response mission area focuses on activities that address the short-term, direct effects of an incident. Response includes immediate actions to save lives, protect property, and meet basic human needs. Response also includes the execution of EOPs and of incident mitigation activities designed to limit loss of life, personal injury, property damage, and other unfavorable outcomes. As indicated by the situation, response activities include: applying intelligence and other information to lessen the effects or consequences of an incident; increasing security operations; continuing investigations into the nature and source of the threat; conducting ongoing public health and agricultural surveillance and testing processes; performing immunizations, isolation, or quarantine; and conducting specific law enforcement operations aimed at preempting, interdicting, or disrupting illegal activity, and apprehending actual perpetrators and bringing them to justice." (**FEMA**, *Homeland Security Exercise & Evaluation Program Glossary*, 2008)

Response and Recovery: "Response and recovery efforts include those of many State and other Federal agencies, private, public, and non-profit organizations, and individuals, coordinated by FEMA. The extensive response effort initially ensures safe water, food, and shelter to disaster victims and assists in the restoration of basic community services from electricity to telephone service. The complex recovery effort assists in the long-range restoration of services including contributing to the rebuilding of roads, bridges, and hospitals. FEMA's response and recovery

activities together reduce human suffering and work toward the restoration of the community. Through such means as pre-positioned capabilities, community outreach, the teleregistration process, information centers, and town meetings, FEMA signifies its commitment to provide to the fullest extent it can human and financial support to its customers. This is accomplished by response and recovery actions to:

- Collect and provide information to the President in the determination of a disaster declaration;
- Conduct emergency operations to save lives and property by positioning emergency equipment, supplies, and personnel;
- Provide accurate, timely public information;
- Gather, analyze, and use data for the determination of applicant eligibility;
- In collaboration with its partners, provide individual and public assistance for immediate needs and long-term recovery;
- Manage loan and grant application, approval, and disbursement;
- Assist in the restoration of communities so that individuals, businesses, and governments can function on their own; and,
- Manage response and recovery operations to assure compliance with laws and regulations." (**FEMA**, *Strategic Plan FY 1988 – FY 2002*, 1997, p. 27)

Response: "The onset of an emergency creates a need for time-sensitive actions to save lives and property, as well as for action to begin stabilizing the situation so that the jurisdiction can regroup. Such response actions include notifying emergency management personnel of the crisis, warning and evacuating or sheltering the population if possible, keeping the population informed, rescuing individuals and providing medical treatment, maintaining the rule of law, assessing damage, addressing mitigation issues that arise from response activities, and even requesting help from outside the jurisdiction." (**FEMA**, *Guide For All-Hazard Emergency Operations Planning* (SLG 101), September **1996**, p. 1-4)

Response: Activities to address the immediate and short-term effects of an emergency or disaster. Response includes immediate actions to save lives, protect property, and meet basic human needs. Based on the requirements of the situation, response assistance will be provided to an affected State under the Federal Response Plan using a partial activation of selected Emergency Support Functions (ESF's) or the full activation of all 12 ESF's to meet the needs of the situation. (**FEMA**, *FRP*, **1999**, Appendix B)

Response: "Those actions taken to save lives and protect property during an emergency event." (**Little Hoover Commission**, *Safeguarding the Golden State*…, 2006, p. 6)

Response: "Carrying out time-sensitive actions to save lives and protect property during an emergency or disaster. In addition to managing the response, actions can include fire fighting, protective actions by law enforcement, warning, evacuation, mass care, emergency public information, search and rescue, health and medical care, resource management, and other activities." (**Michigan DEM** 1998, 7)

Response: "That portion of incident management in which personnel are involved in controlling (defensively or offensively) a hazardous materials incident. The activities in the response portion of a hazardous materials incident include analyzing the incident, planning the response, implementing the planned response, and evaluating progress." (**NFPA 471**, 1997, p. 8)

Response: "Immediate and ongoing activities, tasks, programs, and systems to manage the effects of an incident that threatens life, property, operations, or the environment." (**NFPA 1600**, 2007, p. 8)

"The response of an entity to a disaster or other significant event that might impact the entity. Activities, tasks, programs, and systems can include the preservation of life, meeting basic human needs, preserving business operations, and protecting property and the environment. An incident response can include evacuating a facility, initiating a disaster recovery plan, performing damage assessment, and any other measures necessary." (**NFPA 1600**, 2007, p. 8)

Response: "Response activities follow an emergency or disaster. Generally, they are designed to provide emergency assistance for casualties (for example, search and rescue, emergency shelter, medical care, mass feeding). They also seek to reduce the probability of secondary damage (for example, shutting off contaminated water supply sources, cordoning off and patrolling looting-prone areas) and to speed recovery operations (for example, damage assessment)." (**NGA**, *Comprehensive Emergency Management Governors Guide*, 1979, p. 13)

Response: "Response refers to actions undertaken immediately before and during impact to reduce primary and secondary negative effects." (**Peterson and Perry** 1999, 242)

Response: "…emergency operations to save lives and property through positioning emergency equipment, personnel, and supplies, through evacuating potential victims, through providing food, water, shelter, and medical care to those in need, and through restoring critical public services." (**Post-Katrina Emergency Management Reform Act of 2006**, p. 1399)

Response: "Within this *Strategy*, "response" refers to actions taken in the immediate aftermath of an incident to save lives, meet basic human needs, and reduce the loss of property." (**White House**, *National Strategy for Homeland Security*, Homeland Security Council, Oct. 2007, p. 31)

Response (and Recovery): "Response and Recovery. The Office [Homeland Security] shall coordinate efforts to respond to and promote recovery from terrorist threats or attacks within the United States. In performing this function, the Office shall work with Federal, State, and local agencies, and private entities, as appropriate, to:

(i) coordinate efforts to ensure rapid restoration of transportation systems, energy production, transmission, and distribution systems; telecommunications; other utilities; and other critical infrastructure facilities after disruption by a terrorist threat or attack;

(ii) coordinate efforts to ensure rapid restoration of public and private critical information systems after disruption by a terrorist threat or attack;

(iii) work with the National Economic Council to coordinate efforts to stabilize United States financial markets after a terrorist threat or attack and manage the immediate economic and financial consequences of the incident;

(iv) coordinate Federal plans and programs to provide medical, financial, and other assistance to victims of terrorist attacks and their families; and

(v) coordinate containment and removal of biological, chemical, radiological, explosive, or other hazardous materials in the event of a terrorist threat or attack involving such hazards and coordinate efforts to mitigate the effects of such an attack." (**White House**, *EO 13228*, 2001)

Response Asset Inventory (NIMS): "An inventory of the jurisdiction's resources that have been identified and typed according to NIMS Resource Typing Standards. Development of a Response Asset Inventory requires resource typing of equipment, personnel, and supplies identified in the inventories of State resources." (**FEMA**, *NIMS Compliance Metrics Terms of Reference* (For Fiscal Year 2007), October 23, 2006, p. 9)

Response Assets: Resources that include equipment, personnel and supplies that are used in activities that address the effect of an incident. (**FEMA**, *NIMS Compliance Metrics Terms of Reference* (For Fiscal Year 2007), October 23, 2006, p. 9)

Response Doctrine: "*Our national response doctrine defines basic roles, responsibilities and operational concepts for incident response across all levels of government and with the private sector.* The overarching objective of response activities centers upon saving lives and protecting property. Five elemental principles of operations animate incident response actions in support of the nation's response mission. Taken together, these five principles of operation constitute *national response doctrine*.

*Our response doctrine is rooted in America's federal system and our Constitution's division of responsibilities between Federal and State governments***.** Because this doctrine reflects the history of emergency management and the distilled wisdom of first responders and leaders at all levels, it gives elemental form to the *Framework.*

But our response doctrine "evolves in response to changes in the political and strategic landscape, lessons learned from operations, and the introduction of new technologies. Doctrine influences the way in which policy and plans are developed, forces are organized and trained, and equipment is procured. It promotes unity of purpose, guides professional judgment and enables [first responders] to fulfill their responsibilities."[115] (**DHS**, NRF Draft, Sep 2007, p. 8)

Response Doctrine (NSF): Key Principles: (DHS, *Introducing the NRF*, 2007, p. 4)

Engaged Partnerships. Leaders at all levels must communicate and actively support engaged partnerships to develop shared goals and align capabilities so that none allows the other to be overwhelmed in times of crisis.

---

[115] United States Coast Guard: America's Maritime Guardian, Coast Guard Publication 1 (Washington, DC: January 2002, second printing), p. 3. The term "doctrine" has clear and rich meaning as a guide to action within the military services. See also U.S. Department of Defense's Joint Operations Planning and Execution System, an overview of which is available at http://www.dtic.mil/doctrine/jel/other_pubs/jopes.pdf.

Tiered Response. Incidents must be managed at the lowest possible jurisdictional level and supported by additional response capabilities when needed.

Scalable, Flexible and Adaptable Operational Capabilities. As incidents change in size, scope and complexity, the response must adapt to meet requirements.

Unity of Effort Through Unified Command. Effective unified command is indispensable to all response activities and requires clear understanding of the roles and responsibilities of each participating organization.

Readiness To Act. Effective incident response requires readiness to act balanced with an understanding of risk. From individuals, families and communities to local, State and Federal agencies, national response depends on the instinct and ability to act.

Response Essentials: "The disasters of 1953 demonstrated that, although in an emergency people are willing and anxious to offer their help, they must have **leadership, training, and organization** to be of benefit. Civil defense can provide that leadership, training, and organization. The catastrophes of 1953 clearly showed that the same mena nd women who are organized, equipped, and trained to counteract an atomic blast can be effective on the homefrot in times of flood, earthquakes, tornadoes, and other natural disasters." (**FCDA**, *1953 Annual Report*, p. 17)

Response Management Plan (RMP): National Guard Bureau plan for National Guard Weapons of Mass Destruction Civil Support Team Operations. (**DA**, *WMD CST Ops*, 2007)

Response Planning Criteria For Measuring Key Aspects For Success: "The *Framework* [NRF] employs common criteria to measure key aspects of response planning:

Acceptability. A plan is acceptable if it can meet the requirements of anticipated scenarios, can be implemented within the costs and timeframes that senior officials and the public can support, and is consistent with applicable laws.

Adequacy. A plan is adequate if it complies with applicable planning guidance, planning assumptions are valid and relevant, and the concept of operations identifies and addresses critical tasks specific to the plan's objectives.

Completeness. A plan is complete if it incorporates major actions, objectives, and tasks to be accomplished. The complete plan addresses the personnel and resources required and sound concepts for how those will be deployed, employed, sustained, and demobilized. It also addresses timelines and criteria for measuring success in achieving objectives, and the desired end state. Completeness of a plan can be greatly enhanced by including in the planning process all those who could be affected.

Consistency and Standardization of Products. Standardized planning processes and products foster consistency, interoperability, and collaboration.

Feasibility. A plan is considered feasible if the critical tasks can be accomplished with the resources available internally or through mutual aid, immediate need for additional resources from other sources (in the case of a local plan, from State or Federal partners) are identified in detail and coordinated in advance, and procedures are in place to integrate and employ resources effectively from all potential providers.

Flexibility. Flexibility and adaptability are promoted by decentralized decisionmaking and by accommodating all hazards ranging from smaller-scale incidents to wider national contingencies.

Interoperability and Collaboration. A plan is interoperable and collaborative if it identifies other plan holders with similar and complementary plans and objectives, and supports regular collaboration focused on integrating with those plans to optimize achievement of individual and collective goals and objectives in an incident." (**DHS**, *NR*F, 2008, 74-75)

Response Planning Guide: "Purpose: This regulation establishes policy, provides planning guidance and assigns responsibilities to ensure timely execution of ESF #3, Public Works and Engineering, in support of the Federal Response Plan (FRP), and for high impact, low probability catastrophic events, as determined by Headquarters, USACE (HQUSACE). USACE is the lead Federal agency for execution of planning and ESF #3 missions." (**USACE**, E*mergency Employment of Army and Other Resources Response Planning Guide...*, 1995, p. 1-1)

Response Process: Four key actions typically occur in support of a response:
(1) gain and maintain situational awareness;
(2) activate and deploy key resources and capabilities;
(3) effectively coordinate response actions; then, as the situation permits,
(4) demobilize.
These response actions are illustrated in Figure 3 [titled "The Response Process"]." (**DHS**, *National Response Framework*, Jan 2008,, Jan 2008)

Response Program: "Plan, processes, and resources to perform the activities and services necessary to preserve and protect life, property, operations, and critical assets. Note: Response steps generally include incident recognition, notification, assessment, declaration, plan execution, communications, and resources management." (**ISO 22399**, *Societal*…, 2007, 5)

Response, DHS Response Objectives:

Objective 4.1 Reduce the loss of life and property by strengthening nationwide response readiness: "The Nation must have a vigorous capability to respond when disaster strikes. We will strengthen the national capability to respond to disasters of all types, including terrorism, through the integration of Department of Homeland Security response systems and teams and the completion of catastrophic all-hazard plans for the Nation's most vulnerable communities and geographic areas, including tactical elements to ensure coordinated response operations, logistics and support. We will provide health and medical response readiness through integrated planning, surge capacity to address health and medical emergencies or acts of terrorism and will develop the logistical capacity to provide intermediate emergency housing to large displaced populations following major disasters." (**DHS**, *Strategic Plan 2004*, p. 28)

Objective 4.2 Provide scalable and robust all-hazard response capability: The Nation will know it can rely on us to respond in time of need. We will provide and coordinate a quick and effective response when state, local and tribal resources are overwhelmed by disasters and emergencies. We will bring the right people and resources to bear where and when they are needed most, including medical, urban search and rescue, and incident management capabilities, and will

assist all mariners in peril. We will provide integrated logistical support to ensure a rapid and effective response and coordinate among Department of Homeland Security and other federal, state and local operations centers consistent with national incident command protocols. We will work with our partners to create and implement a National Incident Management System and a single, all-discipline National Response Plan that will strengthen the Nation's ability to respond to catastrophic events of all types, including terrorism. (**DHS**, *Strategic Plan 2004*, p. 29)

Response, Roles and Responsibilities of Key Actors: "Disaster response has traditionally been handled by State, local, and Tribal governments, with the Federal Government and private and non-profit sectors playing supporting and *ad hoc* roles, respectively. A lack of clarity regarding roles and responsibilities across these levels can lead to gaps and seams in our national response and delay our ability to provide life-saving support when needed. Accordingly, we must better articulate how roles, responsibilities, and lines of authority for all response stakeholders are fulfilled across all levels of government and among the private and nonprofit sectors so that each understands how it supports the broader national response. We will continue to base our Federal planning and response efforts on the premise that the vast majority of incidents will be handled at the lowest jurisdictional level possible, with the Federal Government anticipating needs and assisting State, local, and Tribal authorities upon request, when their capabilities are insufficient, or in special circumstances where Federal interests are directly implicated. Public-private partnerships also are essential, and we will work together to better define the roles that the private and non-profit sectors can play, particularly in their local communities, to achieve a more successful response." (**White House**, *National Strategy for Homeland Security*, Homeland Security Council, October 2007, p. 32)

Response, Six Essential Activities for Responding (also noted as "The Preparedness Cycle")

- Plan
- Organize
- Train
- Equip
- Exercise
- Evaluate and Improve (**DHS**, *NRF*, Jan 2008, 27)

Restoration: "Process of planning for and/or implementing procedures for the repair of hardware, relocation of the primary site and its contents, and returning to normal operations at the permanent operational location." (**DigitalCare**, *State of OR BC Workshop*, 2006, p. 63)

Restore Lifelines: "Definition: Ensure the restoration of service for any public utility interrupted by, or in response to an incident." (**DHS**,, *UTL 2.1*, 2005, p. 114)

Restricted Zone (Hazardous Materials Incident): See "Hot Zone."

Resumption: "The process of planning for and/or implementing the restarting of defined business processes and operations following a disaster. This process commonly addresses the most critical business functions within BIA specified timeframes." (**DigitalCare**, *State of OR BC Workshop*, 2006, p. 63)

Retrofit: "Strengthening an existing structure to improve its resistance to the effects of earthquakes." (**USGS**, *Putting Down Roots in Earthquake Country*, 2007, Glossary)

Retrofitting: "Reinforcement of structures to become more resistant and resilient to the forces of natural hazards.

Retrofitting involves consideration of changes in the mass, stiffness, damping, load path and ductility of materials, as well as radical changes such as the introduction of energy absorbing dampers and base isolation systems. Examples of retrofitting includes the consideration of wind loading to strengthen and minimize the wind force, or in earthquake prone areas, the strengthening of structures." (**UN/ISDR**, *Terminology: Basic Terms of Disaster Risk Reduction*, March 31, 2004)

Retrograde Operations: "*Retrograde operations* refers to any movement of a command to the rear or away from the enemy. In the context of a WMD-CST response, a retrograde operation is a movement away from the source of contamination, the spread of contamination, or another hazard. A commander primarily executes retrograde operations to preserve the force and avoid hazards. There are many factors that may cause a WMD-CST to relocate after initial occupation of the WMD-CST footprint. Situations that may result in retrograde operations include substantial wind direction shifts or the expansion of the hazard area around an incident." (**Dept, of the Army**, *WMD-CST Operations*, December 2007, p. 5-8)

Reunification Services Unit (RSU: "The Reunification Services Unit (RSU) serves as the coordinating unit at the Federal level in support of the reunification of separated family members and the location of missing children. They ensure the coordination of information exchange for reunification purposes among Federal, State, local, Tribal and private sector entities and develop & implement programs and processes to comply with NRF and Post-Katrina Emergency Management Reform Act requirements, as well as managing the National Emergency Family Registry & Locator System (NEFRLS) and coordinating with the National Emergency Child Locator Center (NECLC)." (**FEMA**, *Statement of Paulison, Hearing on: "Nuclear Terrorism: Providing Medical Care and Meeting Basic Needs in the Aftermath…",* June 26, 2008, p. 13)

RFA: Request for Assistance. (**DA**, *WMD CST Operations*, 2007, p. 2-4)

RFC: Repetitive Flood Claims. (**FEMA**, *FEMA Region III FY 2007 Annual Report*, 2008, 25)

RFI: Request for Information. (**DA**, *WMD CST Operations*, 2007, p. 2-4; Figure G-2)

Richter Scale: "A logarithmic scale for measuring the magnitude of an earthquake through the measurement of seismic waves recorded by seismographs at a point 60 miles from the epicenter. This measurement is very different from the severity of an earthquake's effects, measured on the Modified Mercalli Scale (defined above). Magnitude is related to wave amplitude and is recorded on a logarithmic scale. Each single-unit jump in magnitude reflects a 32-fold increase in seismic energy generated by the event." (**APA**, *Planning For A Disaster-Resistant Community*, 2005, p. 84)

Richter Scale: Logarithmic magnitude scale of earthquake energy, illustrated by typical impacts.

Energies of earthquakes (Richter-scale Magnitude):

Magnitude		**Energies (TNT)**
1	=	1.7 Kg
2	=	5.9 Kg
3	=	180 Kg
4	=	6 tons
5	=	199 tons
6	=	6,270 tons
7	=	100,000 tons
8	=	6,270,000 tons
9	=	199,000,000 tons (**Reference Center** 1998)

RID: Register of Interpreters for the Deaf. (**CDC**, *Reaching At Risk Populations*, 2007, p. 16)

RIO: Regional Investment Officers, FEMA. (**FEMA**, *Regional-National CONOPS*, 8Feb2008, 6)

RIP: Rehabilitation and Inspection Program, USACE. (**USACE**, *Fact Sheet: National Levee Safety Program*. February 1, 2007, 2)

RISC: Regional Interagency Steering Committee. (**FEMA**, *Mission Assignment* SOPs, 2007, 59)

Risk: A measure of the probability of damage to life, property, and/or the environment, which could occur if a hazard manifests itself, including the anticipated severity of consequences to people. (**Unknown source**)

Risk: "Risk is the product of hazard (H) and vulnerability (V) as they affect a series of elements (E) comprising the population, properties, economic activities, public services, and so on, under the threat of disaster in a given area….Risk is estimated by combining the probability of events and the consequences (usually conceptualized as losses) that would arise if the events take place." (**Alexander**, No Date, 1)

Risk: "The economics literature is intrinsically important to articulating an epistemological definition of risk in its characterization of risk being something different from uncertainty. The idea is that risk and uncertainty both relate to the unknown, but that risk is an attempt to 'control' the unknown by applying knowledge based on the orderliness of the world. Uncertainty, on the other hand, represents the totally random unknown and thus cannot be controlled or predicted." (**Althaus** 2005, 568)

Risk: Risk = Likelihood x Consequence. (**Ansell and Wharton** 1992, 100)

Risk: Risk is defined as: Risk = Hazard x Vulnerability divided by Disaster Management, where "Risk is defined as the scope of consequences (loss of life, damage to property or the environment…. Hazard is defined as the 'Punch of Nature' (external forces)…Vulnerability is defined as the weakness/strength of the element at risk…Disaster Management is defined as a comprehensive strategy based on a set of activities to reduce the risk by: 1. Reduction of the vulnerability of the elements at risk. 2. Ensuring that adequate measures are implemented before

disaster strikes. 3. Responding as efficiently and effectively as possible to disasters when they occur. 4. Assuring a sustainable development of the region stricken." (**Benouar and Mimi** 2001, 6)

Risk: "Risk is nothing more than the consequences of hazard." (**Bezek** 2002)

Risk: "We…need to identify and understand the links between risk, vulnerability, resilience and capacity that go beyond the iconic (though simplistic and misleading) formula of Risk = Vulnerability multiplied by Resilience and divided by Hazard." (**Buckle** 2004, 8)

Risk: "…risk is when you know the possible range of things that may happen following a choice; uncertainty is when you don't….Risk in its general form is when it is possible, at least in principle, to estimate the likelihood that an event (or set of events) will occur; the specific forms of those estimates are the probabilities of adverse consequences." (**Clarke** 1999, 11)

Risk: The possibility of suffering harm from a hazard. (**Cohrssen and Covello** 1989, 7)

Risk: "…the three components of risk: threat, vulnerability, and consequence." (**Critical Infrastructure Task Force** 2006, p. 4).

Risk: "…the measure of likelihood of occurrence of the hazard" (**Cutter** 1993, 2).

Risk: "*Risk* is the probability of an event occurring, or the likelihood of a hazard happening (Presidential/Congressional Commission on Risk Assessment and Risk Management 1997). Risk emphasizes the estimation and quantification of probability in order to determine appropriate levels of safety or the acceptability of a technology or course of action. Risk is a component of hazard." (**Cutter** 2001, 3)

Risk: The probability that a hazardous event will occur and the expected loss of lives and goods due to vulnerability to prevailing hazards. (**D&E** Reference Center 1998)

Risk: The possibility of suffering harm from a hazard. (**Deyle**, et al. 1998, 121)

Risk: "Risk is the product of threat, vulnerability, consequences, and likelihood of occurrence." (**DHS**, *National Preparedness Goal*, December 2005 Draft, p. A-3)

Risk: "Risk is generally defined as the combination of the frequency of occurrence, vulnerability, and the consequence of a specified hazardous event." (**DHS,** *NIPP*, 2006, p. 29)

Risk: "A measure of potential harm that encompasses threat, vulnerability, and consequence. In the context of the NIPP, risk is the expected magnitude of loss due to a terrorist attack, natural disaster, or other incident, along with the likelihood of such an event occurring and causing that loss." (**DHS**, *National Infrastructure Protection Plan*, 2006, p. 105)

Risk: "…Congress directed the Department of Homeland Security to identify and secure those chemical facilities that present the greatest security risk. Security risk is a function of the following:

- the consequence of a successful attack on a facility (consequence),
- the likelihood that an attack on a facility will be successful (vulnerability), and

the intent and capability of an adversary in respect to attacking a facility (threat)." (**DHS**, "Risk for Chemical Facility Anti-Terrorism Standards (CFATS), November 2, 2007)

Risk: "When I say risks I mainly talk about three elements. One is the threat itself. The second is our vulnerability to the threat; and the final is the consequence if the threat actually comes to pass and we're not able to avert it or protect ourselves against it." **(DHS,** *Secretary Michael Chertoff… "Addressing 21st Century Threats: The U.S. Prevention Strategy,"* June 5, 2008)

Risk: "Risk is a combination of credible threat, vulnerability, and consequence." (**DHS**, *Target Capabilities List*, 2007, p. 10)

Risk: "Probability and severity of loss linked to threats or hazards." (**DOD**, *DCIP*, 2005, p. 13)

Risk: "**RISK** is the combination of the likelihood and the consequence of a specified hazard being realized. It is a measure of harm or loss associated with an activity." (**DOT**, *Risk Management Definitions*, Office of Hazardous Materials Safety, 2005)

Risk: "Potential for exposure to loss. Risks, either man-made or natural, are constant. The potential is usually measured by its probability in years." (**DigitalCare**, *State of OR BC Workshop*, 2006, p. 63)

Risk: "A measure of the probability that damage to life, property, and/or the environment will occur if a hazard manifests itself: this measure includes the severity of anticipated consequences to people." (**EPA**, *Technical Guidance for Hazards* Analysis, 1987, p. A-7)

Risk: "…the potential losses associated with a hazard and, defined in terms of expected probability and frequency, exposure, and consequences" (**FEMA** 1997, *Multi Hazard…Risk Assessment,* xxi).

Risk: The estimated impact that a hazard would have on people, services, facilities, and structures in a community; the likelihood of a hazard event resulting in an adverse condition that causes injury or damage. Risk is often expressed in relative terms such as a high, moderate, or low likelihood of sustaining damage above a particular threshold due to a specific type of hazard event. It also can be expressed in terms of potential monetary losses associated with the intensity of the hazard (**FEMA** 2001 (August), a-6)

Risk (flood example): "There are two sides to this risk: the probability of flooding, and the consequences that would follow. An area could have a high probability of flooding but minimal consequences because the area subject to flooding is forested and contains no infrastructure or people, so the risk is low. Conversely, a highly urbanized community that has a moderate or low probability of flooding would be considered high risk, because the consequences of a flood in

that location (loss of life, livelihood, property, health and human suffering) would be very high. We manage the probability side of risk with levees and other structures to control flooding. We manage the consequences side by making land-use decisions that keep infrastructure out of harm's way, or by reducing the consequences to existing infrastructure using a multitude of floodplain management methods." (**Galloway**, *A California Challenge*, 2007, iii)

Risk: "DHS uses an evolving risk-based methodology to identify the urban areas eligible for homeland security grants and the amount of funds states and urban areas receive. DHS designed the methodology to measure the relative risk of a given state or urban area using a risk analysis model that defined *Risk* as the product of *Threat* times *Vulnerability* and *Consequences* (R = T * (V & C)). Given the uncertainties inherent in risk assessment, the methodology uses a combination of empirical data (e.g., population, asset location) and policy judgment (e.g., the nature of the threat for specific areas and the weights to be assigned to specific variables in the model such as critical infrastructure, population, and population density)." (**GAO**, *Homeland Security*: *DHS Improved its Risk-Based Grant Programs' Allocation and Management Methods, But Measuring Programs' Impact on National Capabilities Remains a* March 11, 2008, p. i)

Footnote 9, page 4: "For this formula, DHS defined *Threat* as international threat of terrorism to locations and critical assets in the United States, *Vulnerability* as the susceptibility of an area to successful attack, and *Consequences* as the personal, physical, and economic consequences to an area of a successful attack." (Ibid, p.4)

"Because we have imperfect information for assessing risks, there is a degree of uncertainty in the information used for risk assessments (e.g., what the threats are and how likely they are to be realized). As a result, it is inevitable that assumptions and policy judgments must be used in risk analysis and management. It is important that key decision makers understand the basis for those assumptions and policy judgments and their effect on the results of the risk analysis and the resource decisions based on that analysis." (Ibid, 5-6)

"Since fiscal year 2006, DHS has applied a three-step process which incorporates analyses of risk and effectiveness, to select eligible urban areas and allocate UASI and SHSP funds…:

1. Implementation of a risk analysis model to calculate scores for states and urban areas, defining relative Risk, as the product of Threat, Vulnerability, and Consequences.

2. Implementation of an effectiveness assessment, including a peer review process, to assess and score the effectiveness of the proposed investments submitted by the eligible applicants.

3. Calculation of a final allocation of funds based on states' and urban areas' risk scores as adjusted by their effectiveness scores." (Ibid, p. 6)

Risk: Risk "is the probability that a hazard will occur during a particular time period." (**Godschalk** 1991, 132)

Risk: The potential for realization of unwanted, adverse consequences to human life, health, property, or the environment; estimation of risk is usually based on the expected result of the

conditional probability of the event occurring times the consequence of the event given that it has occurred. (**Gratt** 1987, 244)

Risk: "The expected number of lives lost, persons injured, damage to property, and disruption of economic activity due to a particular natural phenomenon, and consequently the product of specific risk and elements at risk – UNDRO." (**Gunn** 1990, 374.

Risk: Risk is an expression or possible loss over a specific period of time or number of operational cycles. It may be indicated by the probability of an accident times the damage in dollars, lives, or operating units. (**Hammer** 1972)

Risk: "Risk can be defined as the combination of the probability of an event and its Consequences." (**IRM**, *A Risk Management Standard*, 2002, 2; citing **ISO/IEC Guide 73**)

Risk: "Combination of the probability of an event and its consequences. Note 1: The term 'risk' is generally used only when there is at least the possibility of negative consequences. Note 2: In some situations, risk arises from the possibility of deviation from the expected outcome or event." (**ISO 22399**, *Societal Security*…, 2007, 5)

Risk: "A disaster risk is the probability of injury, loss of life, damage to property, disruption of services and activities, and negative environmental effects. The extent to which risk either increases or decreases is the result of interactions within a multiple chain of events." (**Jegillos** 1999, 12)

Risk: "…a measure of the probability of deviation from the expected." (**Kloman** 2001, 24)

Risk: "The western approach defines risk as the probability of physical harm due to technological or natural processes. However, we know that physical risks are always created and effected in social systems. Therefore, understanding risk means considering the social systems within which risk occur. Furthermore, within a social system, individuals do not necessarily share the same perceptions or risk and underlying risk factors.… In the expert knowledge system, disasters are seen as being driven primarily by hazard patters. By contrast, in a people-centered approach, the emphasis shifts from the hazard to a focus on socioeconomic vulnerability." (**Kotze** 1999, 35)

Risk: "Risk refers to the probability that death, injury, illness, property damage, and other undesirable consequences will stem from a hazard" (**Lerbinger** 1997, 267).

Risk: "There are as many definitions of 'vulnerability' and 'risk' as there are agencies in federal, state, and local governments combined….Currently, there is no universally accepted definition of the most basic measures of criticality – vulnerability and risk.

"For example, the intelligence community typically defines 'risk' as R = T + V 9Threat plus Vulnerability). The FBI says 'risk' is R = I x T x V (probability of an incident times threat times vulnerability).[116] A number of other methodologies use arbitrary metrics to gauge risk. The most popular method of gauging criticality of an asset such as a port, telecommunications center, water treatment plant, or transportation terminal is to assign numbers to each asset and then add them

[116] Dean, W. "Risk Assessments and Future Challenges." *FBI Law Enforcement Bulletin*, July 2005.

together. In ranked ordering systems such as the U.S. Coast Guard's port security and risk assessment tool, risk is computed by summing assigned numbers to various properties such as damage, casualties, vulnerability, and threat. These numbers are provided by subject matter experts who, in turn, rely on their individual judgment when rating 'vulnerability' and 'risk'. The port asset with the highest total is declared the most critical.

"The validity of this approach relies on subject matter experts, which does not address the problem of inconsistency across experts. This leads to uneven ranking, because every expert has a different idea of how to assign numbers. It also leads to meaningless totals, because of the different interpretations of what the numbers mean.

"The intelligence community's risk equation is difficult to apply because it is not clear how one compares a low-threat, high-vulnerability asset with a high-threat, low-vulnerability asset. If we add threat and vulnerability together and get the same total, what is the difference? Clearly, a high-threat condition deserves closer scrutiny than a low-threat condition, regardless of the vulnerability, and yet R = T + V produces indistinguishable totals….

"We need a standard, scientifically exact method of assessing vulnerability and risk. Only then will we be able to define vulnerability and risk. A standard definition means that states and localities will be able to compare apples to oranges, and that the result of vulnerability analysis will mean something – across the 50 states….

"Suppose for example, 'vulnerability' is defined as the *probability that an attack will succeed* and 'risk' is defined as the *expected value of the damage caused by a successful attack* Vulnerability is a probability (a number from zero to 100% and risk is a cost (a number that represents the impact of an attack on an asset or entire sector). Mathematically, risk is V x D, where V = vulnerability and D is typically in units of dollars, casualties, or some other loss." (**Lewis and Darken** 2005, 4-5)

Risk: "There are three components of risk – the magnitude of loss, the chance of loss, and the exposure of loss." (**MacCrimmon and Wehrung** 1986, 10)

> "The main definition of the verb 'risk' in the *Oxford English Dictionary*, is 'to expose to the chance of injury or loss.' …First, it is necessary that there be a potential loss of some amount (we will use 'loss' as a general expression to include 'injury'). Second, there must be a chance of loss. A sure loss is not a risk. Third, the notion 'to expose' means that the decision maker can take actions that can increase (or decrease) the magnitude or chance of loss. Therefore 'to risk' implies the availability of choice." (MacCrimmon and Wehrung 1986, 9)

Risk: Risk is when there is "accurate knowledge of a probability distribution of the consequences that will follow on each alternative." (**March and Simon**, 1993)

Risk: Risk can be related directly to the concept of disaster, given that it includes the total losses and damages that can be suffered after a natural hazard: dead and injured people, damage to property and interruption of activities. Risk implies a future potential condition, a function of the

magnitude of the natural hazard and of the vulnerability of all the exposed elements in a determined moment. (**Maskrey** 1989, 1)

Risk: "The term 'risk' is used in two ways. The first is to identify what is **at risk** from the threats generated by the hazard. The second is to identify **the probability** of losing community assets…" (**May**, *Concepts and Terminology*, 2000. p. 6)

Risk: The probability of an event or condition occurring. (**Mileti**, *Disasters By Design*, 1999, 106)

Risk. "A measure of the probability and severity of adverse effects that result from an exposure to a hazard." (**NFPA 1561**, 2002, p. 8)

Risk: Technical definition as follows: Risk (consequence/unit time) = Frequency (events/unit time) x Magnitude (consequence/event). (**Nuclear Regulatory Commission**, *Reactor Safety Study* 1975)

Risk: "The probability, based on available data and scientific knowledge, of a disaster occurring in a particular place." (**Pearce** 2000, Chapter 5, p. 27)

Risk: Defined in three ways:

1. With regard solely to the occurrence probability of the damaging event – a statistical concept.

2. With regard to both event probability and the degree and type of damage or potential damage (here, risk is seen as the product of event probability and severity of impact).

3. With regard to the distribution of power within society as well as to the distribution of costs and benefits. In other words, who bears and who imposes the risk? (**Penning-Rowsell** and Handmer 1990, 6; cited in Pearce 2000, Chapter 2, 20)

Risk: A function of two major factors: (a) the probability that an event, or series of events of various magnitudes, will occur, and (b) the consequences of the event(s). (**Petak and Atkinson** 1982)

Risk: (From **Risky Thinking**, *Risk Glossary*, 2007)

(ISO/IEC Guide 73). The combination of the probability of an event and its consequences.

(Business Continuity). The probability that an asset will be harmed due to a specific cause.

(Insurance). An asset which is insured. For example, if you have a life assurance policy and a homeowner's policy, the industry considers you and your house to be *risks*.

Risk: The potential for unwanted negative consequences of an event or activity. (**Rowe** 1997)

Risk: "…three components…make up a standard risk equation – scenario, probability and consequence…the first component, scenario, challenges the imagination; and the second, probability, defies knowledge. But the third component of risk – consequence – is the outcome of the first two and the most important place to focus one's energy." (**Scalet** 2006)

Risk: The potential losses associated with a hazard, defined in terms of expected probability and frequency, exposure, and consequences. (**Schwab**, et al. 1998, 329)

Risk: For engineering purposes, risk is defined as the expected losses (lives lost, persons injured, damage to property, and disruption of economic activity) caused by a particular phenomenon. Risk is a function of the probability of particular occurrences and the losses each would cause. Other analysts use the term to mean the probability of a disaster occurring and resulting in a particular level of loss. A societal element is said to be at "risk", or "vulnerable", when it is exposed to known disaster hazards and is likely to be adversely affected by the impact of those hazards if and when they occur. The communities, structures, services, or activities concerned are described as elements at "risk". Also, the FEMA damage and casualty production model for simultaneously handling multiple nuclear attacks to produce the spectrum of likely attack results and determine their associated possibilities. A pre-attack planning tool. (**Simeon Institute** 1992)

Risk: Risk is an integral part of life. Indeed, the Chinese word for risk "weij-ji" combines the characters meaning 'opportunity/chance' and 'danger' to imply that uncertainty always involves some balance between profit and loss. Since risk cannot be completely eliminated, the only option is to manage it. (**Smith** 1996, 54)

Risk: The probability per unit time of the occurrence of a unit cost burden. The cost burden may be measured in terms of injuries (fatalities or days of disability) or other damage penalties (expense incurred) or total social costs (including environmental intangibles). Risk thus involves the integrated combination of (a) the probability of occurrences, (b) the spectrum of event magnitudes, and (c) the spectrum of resultant personal injuries and related costs. (**Starr**, Rudman, Whipple, 1976)

Risk: The product of probability and consequences. (**Tarrant** 1997–98, 20)

Risk: "…the chance that some event that affects us adversely will occur." (**Terry** 2001, 330) "…the chance of an adverse event happening and the consequences of that event taken together." (331)

Risk: "Expected losses (of lives, persons injured, property damaged and economic activity disrupted) due to a particular hazard for a given area and reference period. Based on mathematical calculations, risk is the product of hazard and vulnerability. (**UNDHA**, *Internationally Agreed Glossary of Basic Terms Related to Disaster Management*, 1992, p. 64)

Risk: "The probability of harmful consequences, or expected loss (of lives, people injured, property, livelihoods, economic activity disrupted or environment damaged) resulting from interactions between natural or human induced hazards and vulnerable/capable conditions.

Conventionally risk is expressed by the equation Risk = Hazards x Vulnerability/Capacity." (**UN/ISDR** 2002, 24)

Risk: The possibility of loss, injury, disadvantage or destruction; to expose to hazard or danger; to incur risk or danger. (**Webster's** 1981)

Risk: Risk if the product of the probability of the occurrence of a hazard and its societal consequences. (Pearce 2000, Chapter 2, 21; citing **Whyte** and Burton, 1980)

Risk Acceptance: "Decision to accept risk." (**ISO 22399**, *Societal Security*…, 2007, 6)

Risk, Actual: "Actual risk reflects the combination of…two factors…(1) probability, the likelihood, quantitative or qualitative, that an adverse event would occur; and (2) consequences, the damage resulting from the event, should it occur." (**GAO**, *Protection of Chemical and Water Infrastructure*, 2005, p. 24-25)

Risk Analysis: Assesses probability of damage (or injury) and actual damage (or injury) that might occur, in light of a hazard and vulnerability analysis. (**Unknown source**)

Risk Analysis: "Risk analysis involves identifying, measuring or estimating and evaluating risk. There has been considerable debate between engineers and social scientists about whether risk can profitably and successfully be quantified, indeed, whether it is necessary to quantify it al all (**Kleindorfer and Kunreuther** 1987). Engineers (e.g. **Lind** 1987) regard risk analysis as a formal means of quantitatively evaluating the possible misfunctioning of a system by assigning probabilities to a set of predicted outcomes. Social scientists (e.g. **Slovic** 1987) argue that risk need not be quantified to be analyzed and that it is often sufficient to conceptualize a risk in order to know the magnitude of a problem. In general types of risk analysis, comparisons are often more meaningful than absolute numbers or probabilities, especially when the values are quite small, as people tend not to understand likelihoods expressed as small fractions." (**Alexander**, no date, 2) "Formal risk analysis is based upon the creation of an ensemble of scenarios which express what might happen as a chain of occurrences." (**Alexander**, p. 3)

Risk Analysis: "The term risk analysis is often used synonymously with risk assessment. In this book, however, risk assessment refers to the technical assessment of the nature and magnitude of a risk. Risk analysis includes those functions, as well as methods to best use the resulting information. Risk analysis includes methods for:

- Hazard identification
- Risk assessment
- Determining the significance of risk
- Communicating risk information." (**Cohrssen and Covello** 1989, 355)

Risk Analysis: Estimates of the probability of various levels of injury and damage to provide a more complete description of the risk from the full range of possible hazard events in the area. (**Deyle**, et al. 1998, 121-122) Risk analysis makes "a quantitative estimate of damage, injuries, and

costs likely to be experienced within a specified geographic area over a specific period of time." (**Deyle**, et al. 1998, 133-134)

Risk Analysis: "…incorporates estimates of the probability of various levels of injury and damage to provide a more complete description of the risk from the full range of possible hazard events in the area" (**Deyle, French, Olshansky, and Paterson** 1998, 121–122).

Risk Analysis: Risk analysis is the most sophisticated level of hazard assessment. It involves making quantitative estimates of the damage, injuries, and costs likely to be experienced within a specified geographic area over a specific period of time. Risk, therefore, has two measurable components: (1) the magnitude of the harm that may result (defined through vulnerability assessment); and (2) the likelihood or probability of the harm occurring in any particular location within any specified period of time (risk = magnitude x probability). A comprehensive risk analysis includes a full probability assessment of various levels of the hazard as well as probability assessments of impacts on structures and populations. (**Deyle, French, Olshansky, and Paterson** 1998, 134.)

Risk Analysis: "The process by which risks are identified and evaluated." (**DHS**, *FCD 1*, Nov. 2007, P-9)

Risk Analysis: "**RISK ANALYSIS** is the study of risk in order to understand and quantify risk so it can be managed." (**DOT**, *Risk Management Definitions*, Office of Hazardous Materials Safety, 2005)

Risk Analysis: "Objective: Provide a basis to judge the relative likelihood (probability) and severity of various possible events. Risks can be expressed in qualitative terms (high, medium, low) based on subjective, common-sense evaluations, or in quantitative terms (numerical and statistical calculations)." (**EPA**, *Technical Guidance for Hazards Analysis*, 1987, p. K-9)

Risk Analysis: "Method of evaluating the probability of the adverse effects of a substance, industrial process, technology or natural process." (**European Environment Agency**, *EEA Environmental Glossary*, 2007; cites: United Nations. Glossary of Environment Statistics)

Risk Analysis: "*Risk Analysis* promotes disaster resilience by enabling individuals and communities to recover more rapidly from floods and other disasters through effective risk analysis and hazard mitigation planning. To achieve this objective, we will:

- Expand our coastal mapping activity which will improve accuracy of flood hazard maps for coastal areas as part of FEMA's Flood Map Modernization effort.

- Provide data to assist State and local officials to prepare up-to-date hurricane evacuation plans and assess the accuracy of current plans through the Hurricane Evacuation Studies Program.

- Develop tools to ensure that efforts are made to properly address the vulnerabilities associated with the Nation's at-risk dams; that States and local communities have current

information about the safety of dams affecting their localities; and that emergency action plans are in place for high-risk dams.

.

- Provide technical assistance for conducting risk assessments to evaluate all hazards impacts on communities. These risk assessments are key supporting components of local and State mitigation plans, which raise risk awareness; enable State, local, and tribal officials to take advantage of mitigation resources and the full suite of post-disaster assistance; and help them comply with the Disaster Mitigation Act of 2000 which requires each State to have an approved hazard mitigation plan to receive Hazard Mitigation Assistance." (**FEMA**, *Vision for New FEMA*, December 12, **2006**, p. 27)

Risk Analysis: "Risk Analysis applies engineering, planning, and advanced technology to determine the potential impact of natural hazard events and to develop strategies to manage the risks associated with these hazards. Risk Analysis includes assessing critical information both before and after a disaster strikes, developing and maintaining a state-of-the art inventory of flood maps, and supporting mitigation planning." (**FEMA**, "Fact Sheet – FEMA's Mitigation Directorate," August 2007, p. 1)

Risk Analysis: A detailed examination performed to understand the nature of unwanted, negative consequences to human life, health, property, or the environment; an analytical process to provide information regarding undesirable events; the process of quantification of the probabilities and expected consequences for identified risks. (**Gratt** 1987, 244)

Risk Analysis: "The analysis of an environment for risks. Each risk is evaluated according to the losses it may cause, probability of occurrence, the cost of countermeasures to mitigate the risk, and the likely loss if those countermeasures were implemented. The output from a risk analysis is typically a prioritized list of risks together with a cost/benefit analysis for possible countermeasures." (**Risky Thinking**, *Risk Glossary*. 2007.)

Risk Analysis: The systematic use of available information to characterize risk. (**Salter**, 1997–98, p. 24)

Risk Analysis: "The use of available information to estimate the risk to individuals or populations, property, or the environment, from hazards. Risk analysis generally contains the following steps: scope definition, hazard identification, and risk estimation. (**Western**, Cees van. *Disaster Risk Management*, 2005)

Risk Analysis: "Systematic use of available information to determine how often specified events may occur and the magnitude of their likely consequences." (**World Health Organization**, *Mass Casualty Management* Systems, April 2007, p. 31)

Risk Analysis and Management for Critical Asset Protection (RAMCAP): "Created and developed by ASME-ITI and adopted by DHS, RAMCAP is a framework for analyzing and managing the risks associated with terrorist attacks against critical infrastructures. The purpose of RAMCAP is to provide essential information to government decision makers about consequences and vulnerabilities in the private sector, which owns 85 percent of the nation's

critical infrastructure. RAMCAP is unique in that it facilitates the comparison of risks within a sector and across multiple sectors by employing a common terminology and standardized measurement metrics. The RAMCAP methodology is a 7-step process for assets analysis – asset characterization, threat characterization, consequence analysis, vulnerability analysis, threat assessment, risk assessment, and risk management. The process is then tailored to specific aspects of various sectors of the critical infrastructure in documents called Sector-Specific Guidance documents (SSGs). The SSGs will enable companies to identify and report on the vulnerabilities and potential consequences of terrorism by providing guidance on how to complete both preliminary and in-depth assessments." (**ASME**, *Aiding the Fight Against Terrorism*, September 14, 2006)

"RAMCAP is intended to provide asset owners and operators a means to calculate the potential consequences and vulnerability to an attack using a common and consistent system of measurements, or the means to convert the results from prior assessments performed with select approved methodologies into results that can be compared to those obtained using RAMCAP methodologies." (**DHS OIG**, *Fiscal Year 2008 Annual Performance Plan*, 2007, pp. 21-22)

Risk Assessment: "A process by which the results of a risk analysis (i.e., risk estimates) are prepared for use in decisions, either through the relative ranking of risk reduction strategies or through comparison with risk criteria." (**Center for Chemical Process Safety** 1995, xvii)

Risk Assessment: "refers to the technical assessment of the nature and magnitude of risk". (**Cohrssen** and Covello, 1989)

Risk Assessment: "…emphasizes the estimation and quantification of risk in order to determine acceptable levels of risk and safety; in other words to balance the risks of a technology or activity against its social benefits in order to determine its overall social acceptability" (**Cutter** 1993, 2).

Risk Assessment: Determination of vulnerabilities and hazards in certain location to establish risks and risk probabilities. (**D&E Reference Center** 1998)

Risk Assessment: "The identification and assessment of hazards." (**DHS**, *FCD 1*, 2007, P-9)

Risk Assessment: "The determination of risk includes identification and characterization of threats, their consequences, and our vulnerabilities. While each is important for capabilities-based planning and national preparedness, determinations of vulnerability are important since they include not only exposure and sensitivity, but resilience. Resilience is key since it refers to our coping capacity to absorb events, adapt, respond to, and recover from its effects….The completion of a risk assessment, the first step in the preparedness cycle, helps us understand the *types of threats and hazards we face*." (**DHS**, *Target Capabilities List*, 2007, p. vii and 13)

"Risk assessment does not focus on single incidents but rather assesses risk across a number of viable threats and critical assets." (**DHS**, *Target Capabilities List*, 2007, p. 52)

Risk Assessment: "A systematic examination of risk, using disciplined processes, methods, and tools. It provides an environment for decision making to continuously evaluate and prioritize risks and recommend strategies to remediate or mitigate those risks." (**DoD**, *DCIP*, 2005. p. 13)

Risk Assessment: "**RISK ASSESSMENT OR RISK CHARACTERIZATION** is determination of risk context and acceptability, often by comparison to similar risks." (**DOT**, *Risk Management Definitions*, Office of Hazardous Materials Safety, 2005)

Risk Assessment: "Risk assessment includes one or more of the following components:

- Hazard identification,
- Dose-response assessment,
- Exposure assessment,
- Risk characterization." (**Environmental Protection Agency** 1986)

Risk Assessment: "The procedure in which the risks posed by inherent hazards involved in processes or situations are estimated either quantitatively or qualitatively." (**European Environment Agency**, *EEA Environmental Glossary*, 2007)

Risk Assessment: The process of identifying the likelihood and consequences of an event to provide the basis for informed decisions on a course of action. (**FEMA**, *FRP,* **1992**)

Risk Assessment: "Risk Assessment means a process or method for evaluating risk associated with a specific hazard and defined in terms of probability and frequency of occurrence, magnitude and severity, exposure, and consequences" (**FEMA**, *Multi Hazard Identification…,* **1997**, p. xxv)

Risk Assessment: "Risk Assessment defines the potential consequences of a disaster based upon a combination of the community's hazard and vulnerability identification." (**FEMA** *Project Impact*, **1998**, 17)

Risk Assessment: "Risk assessment is the process of measuring the potential loss of life, personal injury, economic injury, and property damage resulting from natural hazards by assessing the vulnerability of people, buildings, and infrastructure to natural hazards. Risk assessment answers the fundamental question that fuels the natural hazard mitigation process: 'What would happen if a natural hazard event occurred in your community.'" A risk assessment tells you:

- "The hazards to which your state or community is susceptible;
- What these hazards can do to physical, social, and economic assets;
- Which areas are most vulnerable to damage from these hazards; and
- The resulting cost of damages or costs avoided through future mitigation projects." (**FEMA**, *Guide for All-Hazard Emergency Operations Planning* (SLG 101), **2001**, iii)

Risk Assessment: "Risk assessment, a critical step in the [risk management framework] approach, helps decision makers identify and evaluate potential risks so that countermeasures can be designed and implemented to prevent or mitigate the effects of risk. Risk assessment is a qualitative and/or quantitative determination of the likelihood of an adverse event occurring and

the severity, or impact, of its consequences. Risk assessment in a homeland security application often involves assessing three key elements—threat, criticality, and vulnerability:

• A threat assessment identifies and evaluates potential threats on the basis of factors such as capabilities, intentions, and past activities.

• A criticality or consequence assessment evaluates and prioritizes assets and functions in terms of specific criteria, such as their importance to public safety and the economy, as a basis for identifying which structures or processes are relatively more important to protect from attack.

• A vulnerability assessment identifies weaknesses that may be exploited by identified threats and suggests options to address those weaknesses.

Information from these three assessments contributes to an overall risk assessment that characterizes risks on a scale such as high, medium, or low and provides input for evaluating alternatives and management prioritization of security initiatives." (**GAO**, *Maritime Security*, Dec. 2007, p. 91)

Risk Assessment: Risk assessment estimates the probable degree of injury and property damage in a given area over a specific time interval (**Godschalk**, Kaiser, and Berke 1998, 99.)

Risk Assessment: The process, including both risk analysis and risk management alternatives, of establishing information regarding and acceptable levels of that risk for an individual, group, society, or the environment. (**Gratt** 1987, 244)

Risk Assessment: "A risk assessment is an objective scientific assessment of the chance of experiencing loss or adverse consequences when physical and social elements are exposed to potentially harmful natural and technological hazards, environmental impact, morbidity, and mortality." (**Hays and Ryland** 2001)

Risk Assessment: "Risk assessment, is a systematic characterization of the probability of an adverse event and the nature and severity of that event (Presidential/Congressional Commission on Risk Assessment and Risk Management 1997). Risk assessments are most often used to determine the human health or ecological impacts of specific chemical substances, microorganisms, radiation, or natural events….In the natural-hazards field, risk assessment has a broader meaning, and involves a systematic process of defining the probability of an adverse event (e.g., flood) and where that event is most likely to occur." (**Hill and Cutter** 2001, 15-16)

Risk Assessment: "Overall process of risk identification, analysis and evaluation. Note: Risk assessment involves the process of identifying internal and external threats and vulnerabilities, identifying the likelihood of an event arising from such threats or vulnerabilities, defining critical functions necessary to reduce exposure, and evaluating the cost of such controls." (**ISO 22399**, *Societal Security…*, 2007, 6)

Risk Assessment: "…the quantitative evaluation of the likelihood of undesired events and the likelihood of harm or damage being caused together with the value judgments made concerning the significance of the results." (**Jones** 1992, 27)

Risk Assessment: "Identification of risks to persons or property, operations, or business function or activity, and evaluation of the importance of the function to the continued business operation. Functions may be classified as critical, essential, or non-essential to their importance in continuing normal operations. May be individual assessments conducted by a particular entity or jointly conducted between the public and private sectors. The vulnerability of each function should also be evaluated. (**Jones**, *Critical Incident Protocol*, 2000, 37)

Risk Assessment: "…a basic risk assessment:

- Identifies the hazard,
- Profiles the hazard event,
- Inventories the assets that would be impacted (affected), and
- Estimates the losses that would result from events (floods) of different probability." (**Larson and Emmer** 2004, Session 16, page 11)

Risk Assessment: "The entity shall identify hazards, monitor those hazards, the likelihood of their occurrence, and the vulnerability of people, property, the environment, and the entity itself to those hazards." (**NFPA 1600**, 2007, p. 8)

"A comprehensive risk assessment identifies the range of possible hazards, threats, or perils that have or might impact the entity, surrounding area, or critical infrastructure supporting the entity. The potential impact of each hazard, threat, or peril is determined by the severity of each and the vulnerability of people, property, operations, the environment, and the entity to each threat, hazard, or peril. The risk assessment should categorize threats, hazards, or perils by both their relative frequency and severity, keeping in mind that there might be many possible combinations of frequency and severity for each. The entity should attempt to mitigate, prepare for, plan to respond to, and recover from those threats, hazards, or perils that are able to significantly impact people, property, operations, the environment, or the entity itself.

A.5.3.1 A number of methodologies and techniques for risk assessment exist that range from simple to complex. These techniques and associated amplifying information include, but are not limited to, the following: (1) "What-if": The purpose of the what-if analysis is to identify specific hazards or hazardous situations that could result in undesirable consequences. This technique has limited structure but relies on knowledgeable individuals who are familiar with the areas/operations/processes. The value of the end result is dependent on the team and the exhaustive nature of the questions they ask regarding the hazards. (2) Checklist: A specific list of items is used to identify hazards and hazardous situations by comparing the current or projected situations with accepted standards. The value of the end result is dependent on the quality of the checklist and the experience/credentials of the checklist user. (3) What-if/checklist: This technique is a combination of the what-if and checklist techniques, and uses the strength of both techniques to complete the risk assessment. The what-if questions are developed and the checklist(s) used to encourage the creativity of the what-if process, as well as fill in any

gaps in the process of developing questions. The value of the end result is dependent on the team and exhaustive nature of the questions they ask regarding the hazards. (4) Hazard and operability study (HAZOP): This technique requires an interdisciplinary team that is very knowledgeable of the areas/operations/processes to be assessed. This approach is thorough, time-consuming, and costly. The value of the end result depends on the qualifications/experience of the team, the quality of the reference material available, the ability of the team to function as a team, and strong, positive leadership. (5) Failure mode and effects analysis (FMEA): Each element in a system is examined individually and collectively to determine the effect when one or more elements fail. This is a bottom-up approach; that is, the elements are examined and the effect of failure on the overall system is predicted. A small interdisciplinary team is required. This technique is best suited for assessing potential equipment failures. The value of the end result is dependent on the credentials of the team and scope of the system to be examined. (6) Fault-tree analysis (FTA): This is a top-down approach where an undesirable event is identified and the range of potential causes that could lead to the undesirable event is identified. The value of the end result is dependent on the competence in using the FTA process, on the credentials of the team, and on the depth of the team's analysis." (**NFPA 1600**, 2007, p. 13-14)

Risk Assessment: "Risk assessment should be recognized as a process which consists of a number of steps. Whilst there is great diversity in the detailed approaches and methodologies used, all risk assessments share some common characteristics. The essential steps are hazard identification including information gathering, an estimation of consequences and frequencies, a characterizations of risk and an evaluation of the significance of the results, which then forms an input to a decision-making process." (**OECD Working Group** 1995, 12)

Risk Assessment: "Risk assessment involves the clarification of the nature of a risk, including its probability of occurrence and likely intensity, and measuring its potential impact on people, property and the environment." (**Pine and Waugh** 2005, 16-9)

Risk Assessment: A five-step process comprised of:

(1) Identification of undesired events.
(2) Analysis of the mechanisms by which undesired events could occur.
(3) Consideration of the extent of any harmful effects.
(4) Consideration of the likelihood of the undesired events and the likelihood of specific detrimental outcomes. Likelihood may be expressed as probability or frequency.
(5) Judgements about the significance of the identified hazards and estimated risks. (**Royal Society Study Group** 1983)

Risk Assessment: (sometimes Risk Analysis) The process of determining the nature and scale of the losses (due to disasters) which can be anticipated in particular areas during a specified time period. Risk assessment involves an analysis and combination of both theoretical and empirical data concerning the probabilities of known disaster hazards of particular force or intensities occurring in each area ("hazard mapping"); and the losses (both physical and functional) expected to result to

each element at risk in each area from the impact of each potential disaster hazard ("vulnerability analysis and expected loss estimation"). (**Simeon Institute** 1992)

Risk Assessment: …*[R]isk Assessment*…is undertaken to find out what the problems are. It involves evaluating the significance of a given quantitative (if necessary, qualitative) measure or risk in an integrated way…Generally speaking, risk assessment is such a complex concept that a single, scientifically repeatable, solution will rarely satisfy all the political and social realities of the decision-making process. (**Smith** 1996, 54)

Risk Assessment: "The statistical analysis of risk…based on mathematical theories of probability and scientific methods for identifying causal links between different types of hazardous activity and the resulting adverse consequences" (**Smith** 1996, 57).

> According to **Kates and Kasperson** (1983), risk assessment comprises three distinct steps:
>
> 1. An identification of hazards likely to result in disasters, i.e. what hazardous events may occur?
> 2. An estimation of the risks of such events, i.e. what is the probability of each event?
> 3. An evaluation of the social consequences of the derived risk, i.e. what is the loss created by each event?" (**Smith** 1996, 58)

Risk Assessment/Analysis: "A process to determine the nature and extent of risk by analyzing potential hazards and evaluating existing conditions of vulnerability/capacity that could pose a potential threat or harm to people, property, livelihoods and the environment on which they depend." (**UN/ISDR** 2002, 24

Risk Assessment: "The term risk analysis is often used synonymously with risk assessment. In this book, however, risk assessment refers to the technical assessment of the nature and magnitude of a risk." (**US Council on Environmental Quality**, 1989, 355)

Risk Assessment: "The process of risk analysis and risks evaluation." (**Western**, Cees van. *Disaster Risk Management*, 2005)

Risk Assessment: (See, also, "Community Risk Assessment")

Risk Assessment, National: "**The National Risk Assessment (NRA)** is a classified cross-government document which incorporates expertise from a wide range of departments and agencies. It assesses the impact and likelihood of the major risks, both hazards and threats, that the country could face over a five year period, enabling prioritisation of the UK's planning for emergencies…. Understanding the risks and determining their relative significance in terms of potential impact is the starting point for emergency planning. The key to turning this into useful planning information is remembering that it is not the risks themselves that people have to deal with when things go wrong, but their consequences." (**UK Cabinet Office**. *The Risk Register*, 2008, 4)

Risk Assessment Process for Informed Decision-making (RAPID): "RAPID is a strategic-level process that uses standardized risk calculus to gauge future risks across the full range of

DHS responsibilities and inform the annual PPBE [Planning, Programming, Budgeting and Execution] cycle. RAPID looks at risk from a broad perspective and offers a strategic view to influence resource allocations through PPBE by seeking to answer the question of what program investments would provide the most risk reduction. In doing so, RAPID will help communicate expected risk reduction performance to DHS decision makers to support priority setting for resources, and potential investment increments and decrements." (**DHS**, *IPG FY 2011*, 9)

Risk Assessment Methodology: "A Risk assessment methodology should consider all risk factors including unexpected parameters. The methodology needs to answer the following basic questions:

What do we know? What is the risk?
Do we have an incident waiting to happen?
What action can we take?
What can go wrong? What are the potential consequences? How likely is it to happen?
What is the chain of events which could lead to harm?
Can we tolerate the potential consequences at the estimated likelihood?
What are the benefits and costs of alternative technologies?" (**Western**, *Disaster Risk Management*, 2005)

Risk Assessment Process:

1. Identify Risks
2. Profile Hazards
3. Inventory Assets
4. Estimate Losses (**Tetra Tech EM Inc**, *Suffolk County*…, 2007, page ES-3)

Risk Assessment Process: "The NRA [National Risk Assessment] process uses historical and scientific data, and the professional judgements of experts to analyse the risks to the UK. There are three stages to this analysis: identification of risks; assessment of the likelihood of the risks occurring and their impact if they do; and comparison of the risks." (**UK Cabinet Office**, *National Risk Register*, 2008, 43)

Risk Assessment Process for Informed Decision-making (RAPID): "…a methodology designed to enable top-level risk-informed resource decisions." (**HSI,** HSI Report Abstracts, April 2007)

Risk Aversion: "…the value people place directly on reducing their own and others' risk of death and injury…" (**Smith** 1996, 72).

Risk-Based: "The *Guidelines* [NPG] establish a risk-based approach to preparedness. Risk is a function of three variables: threat, vulnerability, and consequence. Both threat and vulnerability are influenced by the probabilities of events that are highly uncertain. In order to compensate for that uncertainty, the *Guidelines* provide a set of National planning Scenarios that represent a range of threats that warrant national attention. The National Planning Scenarios establish common assumptions to guide planning nationwide regarding potential vulnerabilities and consequences (or impacts) of major incidents. Analysis of the range of potential impacts is essential for defining capabilities in terms of both capacity (i.e., how many are needed) and

proficiency (i.e., how well must they be able to perform). These capabilities must be reflected in emergency operations plans (for the near-term) and in preparedness strategies (for the long-term). Federal, State, local, tribal, and territorial officials supplement this approach with risk assessments that provide additional data on their specific threats, vulnerabilities, and consequences. As a result, officials can tailor their approach according to differences in risk across the Nation." (**DHS**, *National Preparedness Guidelines*, September 13, 2007, p. 3)

Risk-Based Allocation (DHS): "The risk model used for UASI, SHSP, and LETPP considers the potential risk of terrorism to people, critical infrastructure, and the economy to estimate the relative risk of terrorism faced by a given area. Risk is defined as the product of three principal variables: threat – the likelihood of an attack occurring, vulnerability – the relative exposure to attack, and consequence – the expected impact of an attack." (**DHS**, *Fiscal Year 2007 Homeland Security Grant Program*, July 18, 2007, p. 3)

Risk-Based Analysis: "The risk-based analysis framework is defined as an approach to evaluation and decision making that explicitly, and to the extent practical, analytically, incorporates considerations of risk and uncertainty. These risks and uncertainties arise from measurement errors, short data records, and from the innate variability of complex physical, social, and economic situations, particularly those dealing with future occurrences. Because it captures and quantifies the extent of the risk and uncertainty in the various planning and design components of an investment project, this approach has been found very useful. Each of the components can be examined and conscious decisions made reflecting an explicit tradeoff between risk and costs. Risk-based analysis can identify which plans are more robust and can be used to compare plans in terms of their likely physical performance and economic success." (**USACE**, *Water Resources Policies and Authorities - Digest of Water* Resources..., 1999, 13-3)

Risk Categorization (Likelihood of Event) Example:

0 = No Event
1 = Rare Event
2 = Occasional Event
3 = Frequent Event (**DigitalCare, Inc**., *State of OR BC Training Workshop*, 2006, p. 44)

Risk Characterization: "Integration of evidence, reasoning, and conclusions collected in hazard identification, dose-response assessment, and exposure assessment and the estimation of the probability, including attendant uncertainties, of occurrence of an adverse effect if an agent is administered, taken, or absorbed by a particular organism or population. It is the last step of risk assessment." (**European Environment Agency**, *EEA Environmental Glossary*, 2007)

Risk Characterization: "Risk characterization is a synthesis and summary of information about a potentially hazardous situation that addresses the needs and interests of decision makers and of interested and affected parties. Risk characterization is a prelude to decision making and depends on an interactive, analytical-deliberate process." (**National Research Council**, 1996, p. 27)

Risk Communication: "According to acclaimed risk communication experts Baruch Fischhoff, McGranger Morgan, Ann Bostrom, and Cynthia Atman, risk communication is 'communication

intended to supply laypeople with the information they need to make informed, independent judgments about risks to health, safety, and the environment'." (**Bullock & Haddow** 2005, 295)

Risk Communication: "Risk communication is a field that has flourished in the area of environmental health. Through risk communication, the communicator hopes to provide the receiver with information about the expected type (good or bad) and magnitude (weak or strong) of an outcome from a behavior or exposure. Typically, it is a discussion about an adverse outcome and the probability of that outcome occurring. In some instances, risk communication has been employed to help an individual make a choice about whether or not to undergo a medical treatment, continue to live next to a nuclear power plant, pass on genetic risks, or elect to vaccinate a healthy baby against whooping cough. In some cases, risk communication is used to help individuals adjust to the knowledge that something that has already occurred, such as an exposure to harmful carcinogens, may put them at greater risk for a negative health outcome, such as cancer, in the future. Risk communication would prepare people for that possibility and, if warranted, give them appropriate steps to monitor for the health risk, such as regular cancer screening." (**CDC**, *Crisis and Emergency Risk Communication*, 2002, p. 6)

Risk Communication: "…risk communication: the effective understanding of risks and the transfer of risk information to the public, and the transfer of information from the public to decisionmakers….Risk management decisions should not simply be made by technical experts and public officials and then imposed on, and justified to, the public after the fact. Risk Communication involves a dialogue among interested parties – risk experts, policy makers, and affected citizens." (**Committee on Risk-Based Analysis**…2000, 37)

Risk Communication: "Interactive exchange of information about risks among risk assessors, managers, news media, interested groups, and the general public." (**European Environment Agency**, *EEA Environmental Glossary*, 2007)

Risk Communication: "Exchange or sharing of information about risk between the decision-maker and other stakeholders. Note: The information can relate to the existence, nature, form, probability, severity, acceptability, treatment or other aspects of risk." (**ISO 22399**, *Societal Security*…, 2007, 6)

Risk Communication: "…an interactive process of exchange of information and opinion among individuals, groups and institutions….We construe risk communication to be successful to the extent that it raises the level of understanding of relevant issues or actions for those involved and satisfies them that they are adequately informed within the limits of available knowledge." (**NRC** 1989, 2)

> "The NRC (1989, 149) concludes that four objectives are key to improving risk communications: (1) goal setting, (2) openness, (3) balance, and (4) competence. As a means of achieving these objectives, it is important, at the start of any given project, to determine:
>
> - what the public know, believe, and do not believe about the subject risk and ways to control it;

- what quantitative and qualitative information participants need to know to make critical decisions;
- and how they think about and conceptualize the risk. (NRC 1989, 153)." (**Pearce** 2000, Chapter 3, 16)

"**Pidgeon** et al. (cited in **Horlick-Jones and Jones** 1993, 31) conclude that there are four different conceptual approaches to risk communication:

- Scientific communications – 'top-down' or one-way transmission of some message about a hazard from a particular 'expert' source to a target 'non-expert' audience.
- Two-way exchange – an interactive process that recognizes the important role that feedback plays in any complex communication.
- Wider institutional and cultural contexts stressed – communicator takes account of the actions of risk management institutions, possible conflicting messages, and the history of the hazard in question.
- Risk communication as part of a wider political process – the process as a prerequisite to the enabling and empowerment of risk-bearing groups." (**Pearce** 2000, Chapter 3, 16)

Risk Communication Principles (EPA's Seven Cardinal Rules of Risk Communication):

Risk Communication Principles: Rule 1. Accept and involve the public as a legitimate partner.
Two basic tenets of risk communication in a democracy are generally understood and accepted. First, people and communities have a right to participate in decisions that affect their lives, their property, and the things they value. Second, the goal of risk communication should not be to diffuse public concerns or avoid action. The goal should be to produce an informed public that is involved, interested, reasonable, thoughtful, solution-oriented, and collaborative.

Guidelines: Demonstrate respect for the public by involving the community early, before important decisions are made. Clarify that decisions about risks will be based not only on the magnitude of the risk but on factors of concern to the public. Involve all parties that have an interest or a stake in the particular risk in question. Adhere to highest moral and ethical standards: recognize that people hold you accountable.

Risk Communication Principles: Rule 2. Listen to the audience.
People are often more concerned about issues such as trust, credibility, control, benefits, competence, voluntariness, fairness, empathy, caring, courtesy, and compassion than about mortality statistics and the details of quantitative risk assessment. If people feel or perceive that they are not being heard, they cannot be expected to listen. Effective risk communication is a two-way activity.

Guidelines: Do not make assumptions about what people know, think or want done about risks. Take the time to find out what people are thinking: use techniques such as interviews, facilitated discussion groups, advisory groups, toll-free numbers, and surveys. Let all parties that have an interest or a stake in the issue be heard. Identify with your audience and try to put yourself in

their place. Recognize people's emotions. Let people know that what they said has been understood, addressing their concerns as well as yours. Recognize the "hidden agendas," symbolic meanings, and broader social, cultural, economic or political considerations that often underlie and complicate the task of risk communication.

Risk Communication Principles: Rule 3. Be honest, frank, and open.
Before a risk communication can be accepted, the messenger must be perceived as trustworthy and credible. Therefore, the first goal of risk communication is to establish trust and credibility. Trust and credibility judgments are resistant to change once made. Short-term judgments of trust and credibility are based largely on verbal and nonverbal communications. Long term judgments of trust and credibility are based largely on actions and performance. In communicating risk information, trust and credibility are a spokesperson's most precious assets. Trust and credibility are difficult to obtain. Once lost they are almost impossible to regain.

Guidelines: State credentials; but do not ask or expect to be trusted by the public. If an answer is unknown or uncertain, express willingness to get back to the questioner with answers.
Make corrections if errors are made. Disclose risk information as soon as possible (emphasizing appropriate reservations about reliability). Do not minimize or exaggerate the level of risk. Speculate only with great caution. If in doubt, lean toward sharing more information, not less—or people may think something significant is being hidden. Discuss data uncertainties, strengths and weaknesses—including the ones identified by other credible sources. Identify worst-case estimates as such, and cite ranges of risk estimates when appropriate.

Risk Communication Principles: Rule 4. Coordinate and collaborate with other credible sources
Allies can be effective in helping communicate risk information. Few things make risk communication more difficult than conflicts or public disagreements with other credible sources.
Guidelines: Take time to coordinate all inter-organizational and intra-organizational communications. Devote effort and resources to the slow, hard work of building bridges, partnerships, and alliances with other organizations. Use credible and authoritative intermediaries. Consult with others to determine who is best able to answer questions about risk. Try to issue communications jointly with other trustworthy sources such as credible university scientists, physicians, citizen advisory groups, trusted local officials, and national or local opinion leaders.

Risk Communication Principles: Rule 5. Meet the needs of the media.
The media are a prime transmitter of information on risks. They play a critical role in setting agendas and in determining outcomes. The media are generally more interested in politics than in risk; more interested in simplicity than in complexity; and more interested in wrongdoing, blame and danger than in safety.

Guidelines: Be open with and accessible to reporters. Respect their deadlines. Provide information tailored to the needs of each type of media, such as sound bites, graphics and other visual aids for television. Agree with the reporter in advance about the specific topic of the interview; stick to the topic in the interview. Prepare a limited number of positive key messages in advance and repeat the messages several times during the interview. Provide background

material on complex risk issues. Do not speculate. Say only those things that you are willing to have repeated: everything you say in an interview is on the record. Keep interviews short. Follow up on stories with praise or criticism, as warranted. Try to establish long-term relationships of trust with specific editors and reporters.

Risk Communication Principles: Rule 6. Speak clearly and with compassion.
Technical language and jargon are useful as professional shorthand. But they are barriers to successful communication with the public. In low trust, high concern situations, empathy and caring often carry more weight than numbers and technical facts.

Guidelines: Use clear, nontechnical language. Be sensitive to local norms, such as speech and dress. Strive for brevity, but respect people's information needs and offer to provide more information. Use graphics and other pictorial material to clarify messages. Personalize risk data: use stories, examples, and anecdotes that make technical data come alive. Avoid distant, abstract, unfeeling language about deaths, injuries and illnesses. Acknowledge and respond (both in words and with actions) to emotions that people express, such as anxiety, fear, anger, outrage, and helplessness. Acknowledge and respond to the distinctions that the public views as important in evaluating risks. Use risk comparisons to help put risks in perspective; but avoid comparisons that ignore distinctions that people consider important. Always try to include a discussion of actions that are under way or can be taken. Promise only that which can be delivered, and follow through. Acknowledge, and say, that any illness, injury or death is a tragedy and to be avoided.

Risk Communication Principles: Rule 7. Plan carefully and evaluate performance.
Different goals, audiences, and media require different risk communication strategies. Risk communication will be successful only if carefully planned and evaluated.

Guidelines: Begin with clear, explicit objectives—such as providing information to the public, providing reassurance, encouraging protective action and behavior change, stimulating emergency response, or involving stakeholders in dialogue and joint problem solving. Evaluate technical information about risks and know its strengths and weaknesses. Identify important stakeholders and subgroups within the audience. Aim communications at specific stakeholders and subgroups in the audience. Recruit spokespersons with effective presentation and human interaction skills. Train staff—including technical staff—in communication skills: recognize and reward outstanding performance. Pretest messages. Carefully evaluate efforts and learn from mistakes." (EPA Document OPA-87-020, April 1988. Drafted by Vincent T. Covello and Frederick W. Allen)" (CDC, CERC, 2002, pp. 18-20)

Risk Communication Principles:

1. "Risk communication should involve the open, two-way exchange of information between professionals, including both policy makers and "experts" in relevant disciplines, and the public….
2. Risk management goals should be stated clearly, and risk assessments and risk management decisions should be communicated accurately and objectively in a meaningful manner….

To maximize public understanding and participation in risk-related decisions, agencies should:

a. explain the basis for significant assumptions, data, models, and inferences used or relied upon in the assessment or decision;
b. describe the sources, extent and magnitude of significant uncertainties associated with the assessment or decision;
c. make appropriate risk comparisons, taking into account, for example, public attitudes with respect to voluntary versus involuntary risk; and,
d. provide timely, public access to relevant supporting documents and a reasonable opportunity for public comment." (**OMB and OSTP**, *Updated Principles for Risk Analysis*, September 9, 2007, pp. 10-13.

Risk Control/Risk Treatment: "The process of decision making for managing risks, and the implementation, or enforcement of risk mitigation measures and the re-evaluation of its effectiveness from time to time, using the results of risk assessment as one input. (**Western**, *Disaster Risk Management*, 2005)

Risk Criteria: "Terms of reference by which the significance of risk is assessed. Note: Risk criteria can include associated cost and benefits, legal and statutory requirements, socio-economic and environmental aspects, the concerns of stakeholders, priorities and other inputs to the assessment." (**ISO 22399**, *Societal Security*…, 2007, 6)

Risk-Driven (Core Principle of Emergency Management): "Risk-driven: emergency managers use sound risk management principles (hazard identification, risk analysis, and impact analysis) in assigning priorities and resources." (**EM Roundtable**, 2007, p. 4)

Risk Estimation: "Risk estimation: the process used to produce a measure of the level of health, property, or environmental risks being analysed. Risk estimation contains the followings steps: frequency analysis, consequence analysis and their integration." (**Western**, Cees van. *Disaster Risk Management*, 2005)

Risk Evaluation: "Determiniation of risk management priorities through establishment of qualitative and/or quantitative relationships between benefits and associated risks." (**Business Dictionary**, 2007)

Risk Evaluation: "Establishment of a qualitative or quantitative relationship between risks and benefits, involving the complex process of determining the significance of the identified hazards and estimated risks to those organisms or people concerned with or affected by them. It is the first step in risk management." (**European Environment Agency**, *EEA Environmental Glossary*; cites: International Union of Pure and Applied Chemistry. Risk Assessment Terminology. Chemistry International Vol. 23, No. 2. March 2001. John H. Duffus.)

Risk Evaluation: "The stage at which values and judgements enter the decision process, explicitly or implicitly, by including consideration of the importance of the estimated risks and the associated social, environmental, and economic consequences, in order to identify a range of alternatives for managing the risks. (**Western**, Cees van. *Disaster Risk Management*, 2005)

Risk Evaluation and Control: "Determine the events and environmental surroundings that can adversely affect an organization, the damage that such events can cause, and the controls needed to prevent or minimize the effects of potential loss. (This includes understanding loss potentials; determining the organization's vulnerability to loss potentials; identifying controls and safeguards to prevent or minimize the effect of the loss potential; and evaluating the effectiveness of controls and safeguards.)" (**DRJ & DRII**, *GAP for DC Practitioners*, 2007, 15)

Risk Factors: Frequency of Occurrence
Location
Spatial Area (% of jurisdiction hazard likely to impact)
Duration
Secondary Effects
Seasonality
Speed of onset
Warning availability

Risk Factors (TCL): "Risk factors that affect capability need and placement include:

- population and population density,
- the presence of critical infrastructure and key resources,
- location in high terrorist threat or high risk natural disaster areas, and
- capabilities to prevent, protect against, or mitigate a threat." (**DHS**, *TCL*, 2007, p. 10)

Risk Management: "Risk management is recognized as an integral part of good management practice. It is an iterative process consisting of steps, which, when undertaken in sequence, enable continual improvement in decision-making. Risk management is the term applied to a logical and systematic method of identifying, analyzing, evaluating, treating, monitoring and communicating risks associated with any activity, function or process in a way that will enable organizations to minimize losses and maximize opportunities. Risk management is as much about identifying opportunities as avoiding or mitigating losses. This Standard may be applied at all stages in the life of an activity, function, project or asset. The maximum benefit is usually obtained by applying the risk management process from the beginning. Often a number of differing studies are carried out at different stages of a project. NOTE: This Standard may be applied to a very wide range of activities or operations of any public, private or community enterprise, or group." (**Australia/New Zealand Standards**, *Risk Management*, 1999 (2nd Ed.))

Risk Management: "The essence of risk management lies in maximizing the areas that we have some control over the outcome while minimizing the areas where we have absolutely no control over the outcome and the linkage between cause and effect is hidden from us." (**Berstein**)

Risk Management: "Public Risk management is a process that is used to decide what to do where a risk has been determined to exist. It involves identifying the level of tolerance the community has for a specific risk or set of risks and determines what risk assessment options are acceptable within a social, economic, cultural and political context. To achieve this, the process must be open since it has to factor in benefits, costs of control and any statutory or socially approved requirements needed

to manage the risk. Hence, it requires communicating and consulting with the public-at-large, either directly or through appropriate representation as well as with specialists" (**Britton** 1998, 1).

Risk Management: "Risk management is about playing the odds. It is figuring out which attacks are worth worrying about and spending money on and which are better left ignored. It is spending more resources on the serious attacks – defined as being very likely or if successful having devastating effects – and spending less on the trivial ones. It is taking a finite security budget and making the best use of it.. In other words, homeland security should be about wise choices, not just increased spending." (**De Rugy** 2004, 20)

Risk Management: "Risk management is the process to identify, control, and minimize the impact of uncertain events." (**DHS**, *FCD 1*, November 2007, p. 4)

Risk Management: "The process of identifying, controlling, and minimizing the impact of events whose consequences are or may be unknown, or events that are themselves fraught with uncertainty." (**DHS**, *FCD 1*, November 2007, P-9)

Risk Management: "Definition: a process of measuring or assessing the vulnerability to hazards, threats, or dangers, and subsequent development of strategies to minimize the overall levels of each. Extended Definition: process includes identification, analysis, mitigation plan development, testing, evaluation of safeguards, security review, and monitoring. Annotation: Risk management primarily strives to reduce or eliminate risk through mitigative measures (avoiding the risk or reducing the negative effect of the risk), but also includes the concepts of acceptance and/or transfer of responsibility for the risk as appropriate. Risk management principles acknowledge that, while risk often cannot be eliminated, actions can usually be taken to reduce risk. Example: Risk management framework establishes the process for combining consequence, vulnerability, and threat information to produce a comprehensive, systematic, and rational assessment of risk that drives risk reduction activities." (**DHS**, *Lexicon*, 19Oct07, 23-24)

Risk Management: "Federal, State, local, tribal, territorial, and private-sector entities identify and assess risks, prioritize and select appropriate protection, prevention, and mitigation solutions based on reduction of risk, monitor the outcomes of allocation decisions, and undertake corrective actions. Additionally, Risk Management is integrated as a planning construct for effective prioritization and oversight of all homeland security investments." (**DHS**, *National Preparedness Guidelines*, September 13, 2007, p. 6)

Risk Management: "Let me begin by discussing some key principles that apply to port security and, in fact, to all homeland security. First, we do not believe in security at any cost. We believe in risk management, which means looking at threats, vulnerabilities and consequences, weighing what are the risks we should be most concerned about, considering the measures we are looking to undertake, in terms of whether they are cost beneficial, and then weighing that in terms of making up a strategic plan." (**DHS**, *Remarks by Homeland Security Secretary Michael Chertoff to the American Association of Port Authorities*, March 20, 2007)

Risk Management: "Risk Management is defined by the Government Accountability Office (GAO) as "A continuous process of managing—through a series of mitigating actions that

permeate an entity's activities—the likelihood of an adverse event and its negative impact." Risk Management is founded in the capacity for all levels of government to identify and measure risk prior to an event, based on credible threats/hazards, vulnerabilities, and consequences, and to manage the exposure to that risk through the prioritization and implementation of risk-reduction strategies. The actions to perform Risk Management may well vary among government entities; however, the foundation of Risk Management is constant." (**DHS**, *TCL*, 2007, p. 43)

Risk Management: "The risks we confront continue to evolve and the potential targets across our nation are numerous indeed. If we tried to eliminate every risk, we would obviously fail. Moreover, we would become so heavy-handed with security, we would end up destroying exactly what we are trying to protect -- the normal, daily fabric of life across our nation. So instead of trying to eliminate risk, our overarching strategy is to reduce and manage it. Risk management lets us identify what should concern us most in terms of threats, existing vulnerabilities, and potential consequences. Our risk management philosophy drives all that we do." (**DHS**, *Testimony of Secretary Michael Chertoff before the House Committee on Homeland Security*. (Remarks as Prepared) September 5, 2007)

Risk Management: "What I am committed to doing is a disciplined approach to risk management that considers what is the optimal amount of security, but does it in a way that does not destroy our way of life." (**DHS**, *Testimony of Secretary of Homeland Security Michael Chertoff Before the House Homeland Security Committee*, July, 14, 2005)

Risk Management: "A process by which decision makers accept, reduce, or offset risk." (**DoD**, *Defense Critical Infrastructure Program*, DODD 3020.40, August 2005, p. 13)

Risk Management: "The process of identifying, assessing, and controlling, risks arising from operational factors and making decisions that balance risk cost with mission benefits." (**DoD**, *DOD Dictionary of Military and Related Terms*, 2007)

Risk Management: "A holistic risk management strategy implementation should address the following components:

- Threat assessment, both capability and intent;
- Vulnerability assessment;
- Consequence assessment;
- Mitigation options (cost/benefit) analysis; and
- Mitigation implementation.

"The Risk Management process involves Risk Assessment (the combination of the first three risk elements – threat, vulnerability, and consequence) and Risk Mitigation (development and analysis of mitigation options and implementation of the preferred options). The first three risk elements are strongly interdependent for malevolent threats and must be considered collectively. The success of the Risk Assessment process depends strongly upon good planning, a screening process based upon a preliminary analysis of consequences, and the development of a good baseline description (from which the mitigation options can be developed). The output of the Risk Assessment provides the degree of risk that is to be managed. Various mitigation options

can then be analyzed in a holistic context that considers other operational parameters such as life-cycle cost, operational impact, safety, policy, public opinion, and personal freedoms. These options provide input to the next round of risk assessments that result in risk/operational pairs. For each option there is a reduction in risk and an associated operational 'cost' – a real cost (e.g., life-cycle security, productivity, safety), and a virtual cost (e.g., public opinion, loss of personal freedoms). Only then does the decision-maker have the necessary data to determine which risks should be mitigated and which risks should be accepted."

"Furthermore, all involved in the process must understand the perishability of any risk assessment. With time, all factors can change: the threat may become more or less capable or 'threatening'; vulnerabilities can become more pronounced or less so)because of the implementation of mitigation options, or lack thereof); and consequences may be higher or lower depending on intervening developments involving the asset in question or related assets that may or may not be robust substitutes should something happen to the asset in question. As such, commitment to a risk management strategy also carries a commitment to a continuing process." (**DOD Defense Science Board**, *Report of the DSB Task Force on CHIP*, 2007, p. 15)

Risk Management: "**RISK MANAGEMENT** is the systematic application of policies, practices, and resources to the assessment and control of risk affecting human health and safety and the environment. Hazard, risk, and cost/benefit analysis are used to support development of risk reduction options, program objectives, and prioritization of issues and resources. A critical role of the safety regulator is to identify activities involving significant risk and to establish an acceptable level of risk. Near zero risk can be very costly and in most cases is not achievable. (**DOT**, *Risk Management Definitions*, Office of Hazardous Materials Safety, 2005)

Risk Management: "Process of evaluating alternative regulatory and non-regulatory responses to risk and selecting among them. The selection process necessarily requires the consideration of legal, economic and social factors." (**European Environment Agency**, *EEA Multilingual Environmental Glossary*, 2007; cites: United Nations. Glossary of Environment Statistics)

Risk Management: "Risk management is the deliberate process of understanding 'risk' – the likelihood that a threat will harm an asset with some severity of consequences – and deciding on and implementing actions to reduce it." (**FEMA**, *Building Design for Homeland Security*, January 2004, Unit V-3)

Risk Management: "Risk management—the process for measuring or assessing risk and developing strategies to manage it—is an essential aspect of mitigation. Risk management strategies may include avoiding the risk (e.g., removing structures in floodplains), reducing the negative effect of the risk (e.g., hardening buildings by placing barriers around them), or accepting some or all of the consequences of a particular risk." (**FEMA**. *National Incident Management System* (FEMA 501/Draft), August 2007, p. 21)

Risk Management: "Risk management is a systematic approach for analyzing risk and deciding how best to address it. Because resources are limited and cannot eliminate all risks, careful choices need to be made in deciding which actions yield the greatest benefit." (**GAO**, *Maritime Security*, Dec. 2007, p. 90)

Risk Management: "Coordinated activities to direct and control an organization with regard to risk. Note: Risk management generally includes risk assessment, risk treatment, risk acceptance and risk communication." (**ISO 22399**, *Societal Security*…, 2007, 6)

Risk Management: "Risk management is the process of determining the most beneficial combination of countermeasures and mitigation strategies that can be employed within the constraints of available resources." (**Jones**, *ASME Critical Assets Protection Initiative*, 2004, 11)

Risk Management: "Risk Management is a discipline for dealing with uncertainty." (**Kloman** 2001, 24)

Risk Management: "Risk management is a broad field encompassing all risks including day to day concerns such as safety and liability." (**Manitoba Emergency Measures Organization** (Canada), *Business Resumption Planning*, 1996, p. 8)

Risk Management: "For the purpose of this report, the Working Group defines risk management as: A systematic, analytical process to determine the likelihood that a threat or vulnerability will harm an asset or resource and then identify actions that reduce the risk and mitigate the consequences of the event." (**National Infrastructure Advisory Council**, *Risk Management Approaches to Protection* (Final Report and Recommendations by the Council), October 11, 2005, p. 6)

Risk Management: "The art or act of handling the possibility of loss or injury. Involves four components of (1) Indexing critical operations, (2) Assessing risk exposure for those operations designated as "vital" or "high," (3) Developing mitigation plan outlining who, what, when and how the corrective and preventive actions will be implemented, and (4) Testing and measurement of the effectiveness of the corrective and preventive actions." (**Schaming** 1998, 26-28.)

Risk Management: The process of intervening to reduce risk—the making of public and private decisions regarding protective policies and actions that reduce the threat to life, property, and the environment posed by hazards. Generally, the risk management process attempts to answer the following questions:

1. What can be done?
2. What options or alternatives are available and what are their associated tradeoffs in terms of costs, benefits, and other (current and future risks?
3. What are the effects of current decisions on future options? (**Shaw**, 1999.)

Risk Management: The process whereby decisions are made and actions implemented to eliminate or reduce the effects of identified hazards. (**Simeon Institute** 1992)

Risk Management: *Risk Management* means reducing the threats to life and property (and the environment) posed by known hazards, whilst simultaneously accepting unmanageable risks and maximizing any associated benefits. (**Smith** 1996, 54)

Risk Management: A Framework for the systematic application of management policies, procedures and practices to the tasks of identifying, analyzing, evaluating, treating and monitoring risk. (**Standards Australia/New Zealand** 1995, 4360; quoted in Salter (1997–98, 22)

Risk Management: "The systematic management of administrative decisions, organizations, operational skills and responsibilities to apply policies, strategies and practices for disaster risk reduction." (**UN ISDR** 2002, 25)

Risk Management: "The complete process of risk assessment and risk control (or risk treatment)." (**Western**, *Disaster Risk Management*, 2005)

Risk Management: "Process of deciding what should be done about a hazard; deciding which hazards at what scale (intensity, occurrence interval) should be managed and in what priority." (**Williamson and Lawless**, 2001)

Risk Management, National Level: "Currently, government bodies play a four-part role in risk management at the national level.
• *Action*: from identification of risks to crisis management and risk communication
• *Regulation*: the use of legislation to help prevent the emergence of risks and to protect against the consequences of risks should they arise
• *Economic continuity*: the use of measures (such as release of financial reserves or strategic energy reserves) which ensure economic robustness in the face of a wide range of risk events
• *Insurance*: acting as an insurer of last resort.

"The group established five principles of country risk management which could be applied across the spectrum of governments to guide country risk officers, whether the officer is an individual, a coordinating committee or takes some other institutional form.
• *Accountability*: The need for accountability of risk assessment is seen as a fundamental condition of the legitimacy of assessment as a basis for concerted government action both vertically (within departments of government) and horizontally (across branches of government). Clarity of accountability would increase the incentives for effective mitigation measures.
• *Integrated assessment*: Establishing common procedures across government departments to assess risks, cross-disciplinary scenarios and the language of risk would provide a basis not only for better crisis management but also for defining more effective prevention and mitigation of global risks. Too often positive externalities are overlooked and negative externalities are exaggerated by lack of an integrated assessment of risk.
• *Devolved implementation*: Integrated assessment should not imply centralized implementation. Devolved implementation of risk mitigation strategies should allow flexible and adaptive responses to common risks.
• *Separation of analysis and policy*: The case for devolved implementation is strengthened by the argument in favour of separation of analysis and policy. Analysis is better kept within a separate structure, so as to prevent bureaucratic pressures impinging upon independence of analysis.
• *Disclosure and transparency (if possible)*: Governments are constantly caught between pressure to disclose risk assessments and the need to keep some assessments confidential so as to avoid panic, protect sources and maintain resilience. But even the maintenance of confidential information can create the conditions for incomplete or inaccurate information leading to an

"infodemic" situation in a crisis, where the consequences of popular reaction to a perceived risk far outweigh the risk itself. The development of much more granular risk communication strategies will ensure a culture of maximum disclosure and transparency, while safeguarding against information overload." (World Economic Forum, *Global Risks 2008: A Global Risk Network Report*. January 2008, pp. 36-37)

Risk Management Cycle:

- Identify the risks
- Evaluate the risks
- Identify suitable responses to risk
- Select
- Plan and resource
- Monitor and report. (**RuleWorks**, *The Risk Management Guide*, 2008)

Risk Management Evaluation (RME): "The current understanding of risk management of an environmental challenge." (**Sayles**, *EPA's Risk Management Evaluation of EDCs*, 2002, slide 3)

Risk Management Framework: "…the following questions illustrate a general risk management framework:

- *What are you trying to protect? ...*
- *What are you trying to protect it from? ....*
- *What is the likelihood of each threat occurring and the consequence if it does? ....*
- *What kind of action does the program take in response to the threat?* There are four ways of responding to a threat: acceptance, prevention, interdiction, and mitigation. The response that the program represents may be placed in one or more of these categories:
    - *Acceptance* – Acceptance of a threat is a rational alternative that is often chosen when the threat has low probability, low consequence, or both…. For example, few people remain indoors during storms to avoid the low probability of being struck by lightning.
    - *Prevention* – Prevention is the alteration of the target or its circumstances to diminish the risk of the bad thing happening….
    - *Interdiction* – Interdiction is any confrontation with, or influence exerted on, an attacker to eliminate or limit its movement toward causing harm….
    - *Mitigation* – Mitigation is preparation so that, in the event of the bad thing happening, its consequences are reduced….
- *Does the response create new risks to the asset or others...*"

(**Data Privacy and Integrity Advisory Committee**, *Report of the Data Privacy and Integrity Advisory Committee No. 2006-01*, DHS, Privacy Office, March 29, 2006, pp. 3-4)

Risk Management Framework: "A planning methodology that outlines the process for setting security goals; identifying assets, systems, networks, and functions; assessing risks; prioritizing and implementing protective programs; measuring performance; and taking corrective action. Public and private sector entities often include risk management frameworks in their business continuity plans." (**DHS**, *NIPP*, 2006, p. 105)

Risk Management Framework: "As shown in figure 5 [modified below] a risk management framework represents a series of analytical and managerial steps, basically sequential, that can be used to assess risk, assess alternatives for reducing risks, choose among those alternatives, implement the alternatives, monitor their implementation, and continually use new information to adjust and revise the assessments and actions, as needed. Adoption of a risk management framework can aid in assessing risk by determining which vulnerabilities should be addressed in what ways within available resources." (**GAO**, *Protection of Chemical and Water Infrastructure*, 2005, 24)

- Strategic Goals, Objectives, and Constraints
- Risk Assessment
- Alternative Evaluation
- Management Selection
- Implementation and Monitoring

Risk Management Plan: "A document defining how project risk analysis and management is to be implemented in the context of a particular project." (**Brunswick IS**, *Glossary of Project Management*, 2007)

Risk Management Planning: "Risk Management Planning is about defining the process of how to engage and oversee risk management activities for a project. Risk Management planning is an important part of project management. Having a plan on how to manage risk, allows one to task to plan versus innovating and deciding after the fact and in the midst how to handle a risk. The earlier Risk Management planning is engaged within increases the possibility of success of all risk management activities and processes especially if the process definition was created with input and buy-in from the project manager and key project stakeholders.

The inputs for Risk Management Planning are:

> **Project Scope Statement** – The Project Scope Statement documents the project scope including a description, major deliverables, project objectives, project assumptions, project constraints, and a statement of work. In Risk Management Planning, the project scope statement is commonly used for identifying project boundaries and assumptions.
>
> **Project Management Plan** – The Project Management plan contains the WBS which is used in Risk Management Planning to determine possible areas where risks can occur. For example, if the WBS has usability testing being the last item completed after integrated testing. This is a risk. The usability of the application may have affect on how the information is passed into and out of the application. This could be considered a Project Management Planning Risk.
>
> **Organizational process assets** – The organizations' process assets may contain defined standards and policies pertaining to risk management. Process assets included are risk categories, roles and responsibilities, and processes of how to have a decision made.

Enterprise environmental factors – Enterprise environmental factors reveal the risk tolerance of the organization and the individuals involved in the project. For example, patient billing departments or leaders commonly have absolutely no risk tolerance for any impact to cash flow. This is especially true in non-for-profit organizations like hospitals. However educators and researchers have a high level or risk tolerance. Therefore in an academic medical center, one could have two ranges of risk tolerance. Understanding how much risk your stakeholders and organization are comfortable with help with decisions regarding the type, level, and amount of risk management to apply in the project.

Once the inputs have been obtained the only tool and technique used to engage in risk management planning is the planning meetings and analysis.

Planning Meetings and Analysis – The planning meetings are used to construct the risk management plan. Commonly attendees are the stakeholders, team members, and the project manager. The Risk costs and action plans are developed with assignments and risk responsibilities. When facilitating planning meetings a couple of tips are:

Ensure people can access the inputs to the planning process beforehand – Have a project collaborative a web site and store core project documents including the Project Scope Statement, Project Management Plan, your organization's policies on risk management, and any environmental factors that may affect your project.

Assure the object is to discuss and make decisions about the risk plan – During the Risk Management Planning meetings it is good to cover the five major elements of risk management. These are:

Methodology — Define how risks will be identified, how risk analysis (qualitative and quantitative) will be done, how risk response planning will happen, how risks will be monitored, and how ongoing risk-monitoring activities will occur.
Roles and Responsibilities — Determine who will have responsibility for resolving which risks. Create a matrix, list, or table and assign names. Your organization may already have pre-assigned roles and responsibilities.
Budget — Determine an order-of-magnitude estimate for how much risk-management activities will cost for the project, based on time estimates and personnel costs, and the size, impact, and importance of your project.
Schedule — Define when risk-management activities should be done, and schedule them. High-visibility, important projects will require more frequent risk identification and response than low-visibility or routine projects.
Templates and definitions of terms — Obtain copies of your organization's templates and any pre-existing risk categories and definitions. You and your team will need to discuss and agree on what these terms mean.

Risk Management Planning meetings are all about planning for subsequent risk identification and analysis. It's important not to get involved in actually identifying risks during these meetings.

The output of the Risk Management Planning process is the Risk Management Plan. The Risk Management Plan documents Project Risk Management will be structured and performed on the project.

The components of the Risk Management Plan are as follows:

Methodology – Methodology describes how the Risk Management processes will be performed, the tools which will be utilized, and the data source for handling risk.
Roles and responsibilities – Roles and responsibilities matrix identifies the lead, support, and risk management team for each action item in the risk management plan, and assigns people to the roles clarifying their responsibility and accountability.
Budgeting – Budgeting assigns resource and estimates costs needed for risk management. Simply state it is just better to be honest and above board, budgeting for risk with a risk contingency.
Timing – Timing clarifies the frequency of the risk management process and schedules some risk management activities in the project schedule. Without timely monitoring and response, risks can easily escalate into negative events or become missed opportunities because you failed to exploit them.
Risk categories - Risk categories are potential causes of risk included in the Risk Management Plan for use during the Risk Identification and Risk Analysis processes. Risk categories are sometimes shown as a Risk Breakdown Structure (RBS). The RBS is a hierarchically organized depiction of the identified project risks arranged by risk category and subcategory that identifies the various areas and causes of potential risks.
Definitions of risk probability and impact - Agreeing on standard definitions helps to ensure that everyone is communicating on the same wavelength. Definitions are included in the Risk Management Plan for later use during Risk Analysis.
Probability and impact matrix - The probability and impact matrix assists in determining whether a risk is considered low, moderate, or high by combining the two dimensions of a risk: its probability of occurrence, and its impact on objectives if it occurs.
Revised stakeholder tolerances — As discussions become more specific during planning meetings about actual risks and actual costs, schedules, scope, objectives, and quality criteria, you will begin to get a better idea of your stakeholders' tolerance for risk than you had at the start of the process.
Reporting formats – Reporting formats depict the content and format of the risk register. The Risk Register is a document on which you will record identified risks and their characteristics.
Tracking – Tracking describes how and when risk information will be documented and reviewed for the benefit of current project, future needs, and lessons learned. Tracking also specifies whether risk management processes will be audited." (**Nielsen**, *Risk Management Planning*, February 5, 2007)

Risk Management Self-Evaluation Framework (RMSEF): "A tool to aid all parties (regulators, shippers, carriers, emergency response personnel, etc) in assessing and managing risk." (**DOT**, *Risk Management Self-Evaluation Framework (RMSEF)*, Office of Hazardous Materials Safety, 2005.

Risk Management Strategy: "Developing a complete Risk Management Strategy means generating an organized approach for treatment of all exposures to risk from the organizational perspective. Following a risk management assessment, following the planning of specific treatments for specific risks, an organization must develop a comprehensive risk management strategy for treating risk that best serves the objectives and goals of the organization as a whole." (**CyberSure**, *Risk Management Strategy,* 2008)

Risk Mapping: "Risk mapping is the process of mapping elements/areas at risk and differentiating between low, medium and high risk areas. This activity is best conducted by involving community members and allowing them to lead the exercise. This exercise may also include mapping resources/infrastructure and describing the state in which these are in." (**ProVention Consortium**, *CRA Toolkit: Glossary of Terms*, 2006)

Risk Mapping: "A risk map is a map of a community or geographical zone that identifies the places and the structures that might be adversely affected in the event of a hazard. The production of a risk map requires consideration of areas and features threatened within the community or geographical zone, consultation with people and groups of varying expertise, and the discussion of possible solutions to reduce risk. The benefits of this technique are that it helps to locate the major hazards; they can create shared criteria for decision-making, they can provide a record of historical events that have had a negative impact on the community, and they identify risks so a community may find solutions or take precautions." (**UNDAP**, *Techniques*, 2008)

Risk Mitigation: "Risk Mitigation covers efforts taken to reduce either the probability or consequences of a threat. These may range from physical measures (protective fences) to financial measures (stockpiling cash, insurance)." (**Risky Thinking**, *Risk Glossary*, 2007)

Risk Monitoring: "Process of following up the decisions and actions within risk management in order to ascertain that risk containment or reduction with respect to a particular hazard is assured." (**European Environmental Agency**, *EEA Multilingual Environmental Glossary*; cites: International Union of Pure and Applied Chemistry. Risk Assessment Terminology. Chemistry International Vol. 23, No. 2. March 2001. John H. Duffus)

Risk Perception: "Slovic (cited in Slaymaker 1995, 3) defines risk perception as 'the 'common sense' understanding of hazards, exposure and risk, arrived at by a community through intuitive reasoning …usually expressed…as 'safe' or 'unsafe'.' He goes on the mention that 'policy decisions are almost always driven by perceived risk among the population affected and among decision makers [and that] these perceptions are commonly at variance with 'technical' risk assessments.'" (**Pearce** 2000, Chapter 3, 18)

Risk Reduction: "Risk Reduction creates safer communities by proactively reducing risk and enhancing the capability of States and local communities to reduce their risk from natural hazards." (**FEMA**, *Vision for New* FEMA, December 12, **2006**, p. 28)

Risk Reduction: "Risk Reduction works to reduce risk to life and property through land use planning, floodplain management, the adoption of sound building practices, and a variety of grant programs that support these activities. Mitigation projects that reduce risk include elevating, relocating, or acquiring properties located in floodplains and returning them to open space, and the reinforcing of buildings in earthquake-prone areas." (**FEMA**, "Fact Sheet – FEMA's Mitigation Directorate," August **2007**, p. 1)

Risk Reduction: "Actions taken to lessen the probability, negative consequences, or both, associated with a risk." (**ISO 22399**, *Societal Security*…, 2007, 6)

Risk Reduction: Long-term measures to reduce the scale and/or the duration eventual adverse effects of unavoidable or unpreventable disaster hazards on a society which is at risk, by reducing the vulnerability of its people, structures, services, and economic activities to the impact of known disaster hazards. Typical risk reduction measures include improved building standards, flood plain zoning and land-use planning, crop diversification, and planting windbreaks. The measures are frequently subdivided into "structural" and "non-structural", " active" and "passive" measures. N.B. A number of sources have used " disaster mitigation" in this context, while others have used "disaster prevention." (**Simeon Institute** 1992)

Risk Reduction Return on Investment. Self-defining.

Risk Tolerance: "Total amount of risk that an organization is prepared to accept, tolerate, or be exposed to at any point in time." (**ISO 22399**, *Societal Security*…, 2007, 7)

Risk Tolerance: "The ability of an organization to survive the losses associated with risks." (**Risky Thinking**, *Risk Glossary*, 2007)

Risk Transfer: "Sharing with another party the burden of loss or benefit or gain for a risk." (**ISO 22399**, *Societal Security*…, 2007, 6)

Risk Treatment: "Process of selection and implementation of measures to modify risk. Note 1: The term 'risk treatment' is sometimes used for the measures themselves. Note 2: Risk treatment measures can include avoiding, optimizing, transferring or retaining risk." (**ISO 22399**, *Societal Security.*…, 2007, 7)

Risk Typologies:

1. *Subjective risk*: The mental state of an individual who experiences uncertainty or doubt or worry as to the outcome of a given event.

2. *Objective risk*. The variation that occurs when actual losses differ from expected losses.

3. *Real risk*. The combination of probability and negative consequence that exists in the real world.

4. *Observed risk:* The measurement of that combination obtained by constructing a model of the real world.

5. *Perceived risk:* The rough estimate of real risk made by an untrained member of the general public. (**Thompson**, 1986)

Robert T. Stafford Disaster Relief and Emergency Assistance Act (Stafford Act). " The Stafford Act authorizes the President to provide financial and other forms of assistance to State and local governments, certain private nonprofit organizations and individuals to support response, recovery and mitigation efforts following Presidential emergency or disaster declarations." (**DHS**, *NRF Comment Draft*, September 2007, p. 38). See also, "Stafford Act." Additional information about the Stafford Act's disaster process and disaster aid programs is available at http://www.fema.gov/hazard/dproc.shtm.

"Pub. L. No. 93-288, 88 Stat. 143 (1974), codified in 42 U.S.C. §§ 5121-5206 (2005), was also amended in the Department of Homeland Security Appropriations Act of 2007, Pub. L. No. 109-295, 120 Stat. 1355 (2006), particularly Title VI, the Post-Katrina Emergency Management Reform Act of 2006 (discussed below). The Stafford Act describes the programs and processes by which the Federal Government provides disaster and emergency assistance to State and local governments, tribal nations, eligible private nonprofit organizations, and individuals affected by a declared major disaster or emergency. The Stafford Act covers all hazards, including natural disasters and terrorist events." (**DHS**, *National Response Framework List of Authorities and References* (Draft), September 10, 2007, p. 2)

Robert T Stafford Disaster Relief & **Emergency Assistance Act: Vesting of Responsibilities:**

"The purpose of this title is to provide a system of emergency preparedness for the protection of life and property in the United States from hazards and to vest responsibility for emergency preparedness jointly in the Federal Government and the States and their political subdivisions. The Congress recognizes that the organizational structure established jointly by the Federal Government and the States and their political subdivisions for emergency preparedness purposes can be effectively utilized to provide relief and assistance to people in areas of the United States struck by a hazard. The Federal Government shall provide necessary direction, coordination, and guidance, and shall provide necessary assistance, as authorized in this title so that a comprehensive emergency preparedness system exists for all hazards. (Robert T. Stafford Act, Title VI -- Emergency Preparedness Sec. 601. Declaration of policy (42 U.S.C. 5195))

[Thus, it is not, as is often stated, the case that emergency management or disaster preparedness, is primarily the responsibility of State and Local government, with the role of the Federal government as a secondary role of supporting and assisting State and local governments. Emergency management/disaster preparedness is a "joint" [equal] responsibility of Federal, State and local political subdivisions.]

Robust Organizations: "The robust organization…is set up to cope with increasing uncertainty in the environment. Accordingly, a high-performing, robust organization has four key characteristics: alertness, agility, adaptability, and alignment. Alertness captures the organization's focus on measuring results and establishing performance expectations. Agility is tied to improved communication and the sharing of decision-making authority throughout the organization. Adaptability stems from a better understanding of customer needs and internal performance incentives. Finally, alignment is created through extensive information and technology. These attributes are believed to be key to enabling organizations to be high performing in the face of deep uncertainty." (**Light**, *Predicting Organizational Crisis Readiness: Perspectives and Practices toward a Pathway to Preparedness*, 2008, p. 17; cites: Paul C. Light, *The Four Pillars of High Performance: How Robust Organizations Achieve Extraordinary Results* (New York: McGraw Hill, 2005))

ROE: Rules of Engagement. (**DA**, *WMD-CST Operations*, December 2007, Glossary-6)

Roentgen: "A unit of exposure to gamma (or X) radiation….An exposure of 1 roentgen results in the deposition of about 94 ergs of energy in 1 gram of soft body tissue. Hence, an exposure of 1 roentgen is approximately equivalent to an absorbed dose of 1 rad in soft tissue." (**Glasstone**, *The Effects of Nuclear Weapons*, 3rd Ed., 1977, Glossary, p. 638)

ROEP: Rules of Exercise Play. (**DHS**, *HSEEP*, Vol. V, 2005, p. 54)

Rogue State: "A country engaged in behavior counter to the norms of international security, such as supporting terrorism or developing weapons of mass destruction." (**NDP**, *Transforming Defense*, 1997, 92)

Roles/Responsibilities, All Levels: DHS Secretary Michael Chertoff, 17Dec07, in response to question: "…how do you make the determination as to whether something ought to be a federal

program emanating out of Washington, D.C., versus finding the best practice out in the community and turning that into a national program?"

"That is a great question, which strikes at the heart of one of the most challenging parts of the job. I think we all recognize -- although it's sometimes hard to know whether people in Washington will share this view -- that the federal government really can't be and shouldn't be the nanny for everything; to take care of everything directly. First of all, it would be astronomically expensive, but beyond that, it would really take the decision-making out of the hands of people who know best of what is the right way to implement things, and put it in a remote bureaucracy in Washington.

"I think the genius of our system is an appropriate level of responsibility for the appropriate task. So let me divide it into **three categories**.

"I think for most of what we do, in terms of protecting and responding and even preventing, a lot of the responsibility has to be in the hands of the **private sector and local communities**. That's because they know what is best and what works best. Now, we can do a couple things. We can lay out some guidance to the right way to do things. We can convey information that gives people a sense of what the threats are and what the challenges are, and what works and what doesn't. We can help facilitate network-sharing. We can even, in some circumstances, put down performance standards, like we're doing with the chemical industry, for example.

"But in the end, we don't want to micromanage. We want to say, here's what you need to be able to do, here's the right way to do it -- or, here's the right kinds of things you have to be able to do, but you decide what is the best way to actually implement it based upon your knowledge and your experience about how to get things done in your community or your business. Now, this…doesn't satisfy those who enjoy or believe that the only way to deal with an issue is what I call "Soviet-style" management, where there's that heavy hand of government on everything. But I do think it's particularly apt in the 21st-century world, which is a world of networking, which is not hierarchical.

"The **second stage** is dealing with matters that ought to be really **state responsibilities**, particularly in the area of prevention where we're dealing, again, with concerns about home-grown terrorism. In many cases, the challenges are what we would call "low-signature threats" -- threats that may not be detectable from spies and satellites, but require community-based policing and community-based knowledge to detect and deter and prevent threats before they come into effect. Because of that, again, we don't want to have the federal government become the choke point to which all this information has to pass before action takes place. That's why we're supporting fusion centers, including fusion centers with responders as well as police officials, so that states and localities can take action quickly to address issues. Now, we want to be able to have visibility into that, we want to share information up and down, but we don't want to slow up the process.

"**Finally,** we do recognize there are some matters that are **national responsibilities,** and those ought to be areas where we do get our hands dirty and our boots on the ground, so that while with respect to the other categories of information our role could be to enable, to assist, to give

information, to set standards, and to help fund, in the area of national priorities, we actually have to be operators, and we have to focus and make sure we can do those operational incidents.

"What do those include? Well, it includes securing our borders; that's why we're putting a lot of effort into that. It includes looking at high-consequence terrorists attacks that could have a national or at least a regional impact; that's where we do use the tools of our intelligence community. It involves really catastrophic responses that overwhelm local and state government; and that's why we're doing planning with the National Guard and the military for the first time in a way we've never done before, so that in that kind of emergency, we really could step in and play a national role.
"I think by keeping a different step of strategies for the appropriate level, we are maximizing our scope and we're minimizing our intrusiveness and the heavy hand of Washington." (**DHS**, *Remarks by Secretary Michael Chertoff to the National Congress for Secure Communities*, 17 Dec 2007)

Roles/Responsibilities, Elected and Appointed Officials: "Elected and appointed officials help their communities prepare for, respond to, and recover from potential incidents. Key responsibilities include:
• Establishing strong working relationships with local jurisdictional leaders and core private-sector organizations, voluntary agencies, and community partners. The objective is to get to know, coordinate with, and train with local partners in advance of an incident and to develop mutual aid and/or assistance agreements for support in response to an incident.
• Leading and encouraging local leaders to focus on preparedness by participating in planning, training, and exercises.
• Supporting participation in local mitigation efforts within the jurisdiction and, as appropriate, with the private sector.
• Understanding and implementing laws and regulations that support emergency management and response.
• Ensuring that local emergency plans take into account the needs of:
    -- The jurisdiction, including persons, property, and structures.
    -- Individuals with special needs, including those with service animals.
    -- Individuals with household pets.
• Encouraging residents to participate in volunteer organizations and training courses." (**DHS**, *NRF*, Jan 2008, 16)

Roles/Responsibilities, Elected and Appointed Officials: "When emergency occurs, the first thing people look for are information, aid, assistance, and direction from their elected and appointed officials. This expectation is more evident in every new emergency as Americans increasingly look to their government to be their 'guardian' in times of disaster. The consequences of a government not being prepared for an emergency can be disastrous, involving potential loss of life, human suffering, damage to homes, businesses, and other property, and the loss of public confidence in government and its leadership." (FEMA, An Introduction to SCM, Sep 1992, 6)

Roles/Responsibilities, Individuals and Households: "Although not formally a part of emergency management operations, individuals and households play an important role in the overall emergency management strategy. Community members can contribute by:

- ***Reducing hazards in and around their homes.*** By taking simple actions, such as raising utilities above flood level or taking in unanchored objects during high winds, people can reduce the amount of damage caused by an incident.
- ***Preparing an emergency supply kit and household emergency plan.*** By developing a household emergency plan and assembling disaster supplies in advance of an event, people can take care of themselves until assistance arrives. This includes supplies for household pets and service animals. See the recommended disaster supplies list at http://www.ready.gov.
- ***Monitoring emergency communications carefully.*** Throughout an emergency, critical information and direction will be released to the public via various media. By carefully following the directions provided, residents can reduce their risk of injury, keep emergency routes open to response personnel, and reduce demands on landline and cellular communication.
- ***Volunteering with an established organization.*** Organizations and agencies with a role in response and recovery are always seeking hardworking, dedicated volunteers. By volunteering with an established voluntary agency, individuals and households become part of the emergency management system and ensure that their efforts are directed where they are needed most.
- ***Enrolling in emergency response training courses.*** Emergency response training, whether basic first aid through the American Red Cross or a more complex course through a local college, will enable residents to take initial response actions required to take care of themselves and their households, thus allowing first responders to focus on higher priority tasks that affect the entire community. (**DHS**, *NRF*, Chapter I: Roles and Responsibilities, Jan 2008, pp. 17-18)

Roles/Responsibilities, Individuals and Households: "…the cornerstone of preparation is individual preparation. Have a plan, know how to get the information about what you need to do in the event that a hurricane looms on the horizon. Have some water and food and medicine and a radio, so if you wind up getting caught in a situation where there aren't supplies for 48 or 72 hours, you have the capability to sustain yourself. None of this is rocket science. It's the same steps you would take to make sure your house is prepared against a fire or some other kind of more predictable problem. And if people will make individual preparations, they make it easier for the responders, who then can first focus on people who can't help themselves, either because they're sick or old or poor. And those people need to get help first. So people who have the wherewithal and the capability to help themselves, I think have a civic responsibility to do it." (**DHS**, *Remarks by Chertoff and Paulison on Hurricane Preparedness*, May 20, 2008)

Roles/Responsibilities, Law Enforcement: "The **Attorney General** is the chief law enforcement officer of the United States. Generally acting through the Federal Bureau of Investigation, the Attorney General has the lead responsibility for criminal investigations of terrorist acts or terrorist threats by individuals or groups inside the United States or directed at U.S. citizens or institutions abroad, as well as for coordinating activities of the other members of the law enforcement community to detect, prevent, and disrupt terrorist attacks against the

United States. This includes actions that are based on specific intelligence or law enforcement information. In addition, the Attorney General approves requests submitted by State Governors pursuant to the Emergency Federal Law Enforcement Assistance Act for personnel and other Federal law enforcement support during incidents. The Attorney General also enforces Federal civil rights laws and will provide expertise to ensure that these laws are appropriately addressed." (**DHS**, *NRF*, Jan 2008, 25)

Roles/Responsibilities, Military: "Many DOD components and agencies are authorized to respond to save lives, protect property and the environment, and mitigate human suffering under imminently serious conditions, as well as to provide support under their separate established authorities, as appropriate. The provision of defense support is evaluated by its legality, lethality, risk, cost, appropriateness, and impact on readiness. When Federal military and civilian personnel and resources are authorized to support civil authorities, command of those forces will remain with the Secretary of Defense. DOD elements in the incident area of operations and National Guard forces under the command of a Governor will coordinate closely with response organizations at all levels." (**DHS**, *NRF*, Jan 2008, 26)

Roles/Responsibilities, Private Sector: "Essential private-sector responsibilities include:

- Planning for the protection of employees, infrastructure, and facilities.
- Planning for the protection of information and the continuity of business operations.
- Planning for responding to and recovering from incidents that impact their own infrastructure and facilities.
- Collaborating with emergency management personnel before an incident occurs to ascertain what assistance may be necessary and how they can help.
- Developing and exercising emergency plans before an incident occurs.
- Where appropriate, establishing mutual aid and assistance agreements to provide specific response capabilities.
- Providing assistance (including volunteers) to support local emergency management and public awareness during response and throughout the recovery process." (**DHS**, *NRF*, Jan 2008, 19-20)

Roles/Responsibilities, State Government: "A primary role of State government is to supplement and facilitate local efforts before, during, and after incidents. The State provides direct and routine assistance to its local jurisdictions through emergency management program development and by routinely coordinating in these efforts with Federal officials. States must be prepared to maintain or accelerate the provision of commodities and services to local governments when local capabilities fall short of demands." (**DHS**, NRF, Jan 2008, 21)

RUF: Rules for the use of force for domestic support to civil authority missions. (**Center for Law and Military Operations and HQ Marine Corps, Judge Advocate Division**, *ROE v. RUF*, 2006)

Rules for the Use of Force and Weapons for US Forces: "CJCSI 3125.01A, *Military Assistance to Domestic Consequence Management Operations in Response to a Chemical, Biological, Radiological, Nuclear, or High-Yield Explosive Situation*, Enclosure E, establishes a presumption that units deployed to sites of a CBRNE situation will not carry arms. Units may deploy to sites of CBRNE situations with their weapons in storage in the event that the unit is subsequently authorized to carry arms by the SecDef or is deployed from the CBRNE site to an assignment where weapons are authorized. Military commanders are responsible to ensure that weapons and ammunition are properly stored and physically secured. Military members providing security for stored weapons and ammunition at military facilities during CBRNE CM operations may carry their weapons while performing their normal security duties. In accordance with CJCSI 3121.01B, *Standing Rules of Engagement/Standing Rules for the Use of Force for US Forces* (S), mission-specific RUF for CBRNE CM operations are set forth in CJCS Contingency Plan (CONPLAN) 0500-98 (U), Annex C. National and local decisions about force protection conditions (FPCON) may have an impact on the arming policy. The decision to implement a particular FPCON is a command decision and the JTF commander may set a higher FPCON if warranted by threat level assessments for the joint operations area (JOA). FPCON is

based on an assessment of the vulnerability of JTF personnel or facilities, criticality of personnel or facilities, availability of security resources, impact on operations and morale, damage control considerations, and other international or US actions. Because the CBRNE CM mission is most likely in response to a terrorist attack, it is highly likely that deterrent measures may include requesting SecDef authorization to arm the response forces along with taking other additional security measures based on local FPCON." (**JCS/DOD**, *CBRNE CM*, 2006, pp. II-4 and II-5; see, also, **Dept. of the Army**, *WMD-CST Operations*, December 2007, p. A-1)

Rules for the Use of Force for US Forces: "CJCSI 3121.01B, *Standing Rules of Engagement/Standing Rules for the Use of Force for US Forces*, establishes fundamental policies and procedures governing the actions to be taken by US commanders and their forces during all DOD CS [Civil Support] and routine military department functions occurring within the US territory or US territorial seas. SRUF also apply to land HD missions occurring within US territory…. Unless otherwise directed by a unit commander (IAW CJCSI 3121.01B, *Standing Rules of Engagement/Standing Rules for the Use of Force for US Forces*), military personnel have the right under law to use force that is reasonably necessary under the circumstances to defend themselves against violent, dangerous or life-threatening personal attack. In addition, military personnel are authorized to use force to discharge certain duties." (**JCS/DoD**, *Civil Support*, 2007, p. B-1; see, also, **Dept. of the Army**, *WMD-CST Operations*, December 2007, p. A-1)

Rupture Zone: "The area of the Earth through which fault movement occurred during an earthquake. For large quakes, the section of the fault that ruptured may be several hundred miles in length. Ruptures may or may not extend to the ground surface." (**USGS**, *Putting Down Roots*, 2007, Glossary)

Rural Domestic Preparedness Consortium (RDPC): "Recognizing that Emergency Services Sector (ESS) departments and agencies in rural communities across the country face unique challenges, the U.S. Congress authorized the development of the Rural Domestic Preparedness Consortium (RDPC) in 2004, to create and deliver all-hazards training in support of rural homeland security. The RDPC is now offering responder organizations throughout the nation a free resource to bolster critical incident protection and maintain response capabilities: Department of Homeland Security (DHS)-certified hands-on training. Eastern Kentucky University subsequently received funding from DHS to establish such a consortium. In 2006, the Consortium conducted a training needs assessment. The assessment instrument was organized based on the DHS Target Capabilities List with input from law enforcement, fire, EMS, public health, and local officials. From the standpoint of the number of personnel needing training, each discipline named a different Target Capability as its greatest training need: law enforcement (responder safety and health); fire service (citizen preparedness and participation); EMS (CBRNE detection); public health (planning for terrorism events); and, general government (WMD/hazmat response and decontamination). For information at the EKU College of Justice and Safety website, go to: http://www.jsc.eku.edu/news_2007.05.08.asp

Safe, Accountable, Flexible, Efficient Transportation Equity Act; A Legacy for Users (SAFETEA-LU), 2005: Signed by President George W. Bush on August 10, 2005. This act states that:

> "The Secretary [of Transportation] and the Secretary of Homeland Security, in coordination with Gulf Coast States and contiguous States, shall jointly review and assess Federal and State evacuation plans for catastrophic hurricanes impacting the Gulf Coast Region and report its findings and recommendations to Congress. …The Secretaries shall consult with appropriate Federal, State, and local transportation and emergency management agencies…and consider, at a minimum, all practical modes of transportation available for evacuations; the extent to which evacuation plans are coordinated with neighboring States; methods of communicating evacuation plans and preparing citizens in advance of evacuations; and methods of coordinating communication with evacuees during plan execution."

In response, the DHS initiated the Nationwide Plan review of 2005-2006. (**DHS**, *Nationwide Plan Review Phase 1 Report*. February 10, 2006, pp. 2-3)

SAFE Port Act: Security and Accountability for Every Port Act of 2006. (**GAO**, Dec 2007)

Safe School Initiative: "Established in collaboration by the U.S. Secret Service and the U.S. Department of Education's Safe and Drug Free Schools Program, the Safe School Initiative (SSI) focuses on prevention and provides useful information about the thinking and behavior of students who commit acts of targeted violence in our nation's schools. One of the key recommendations of the SSI was that schools form multidisciplinary threat assessment teams to assist with identifying, assessing and managing students who may pose a threat of targeted violence. An interactive CD-ROM, titled A Safe School and Threat Assessment Experience: Scenarios Exploring the Findings of the Safe School Initiative, complements the published documents of the Safe School Initiative. The CD is available to law enforcement and school safety personnel across the country and can be ordered via the Department of Education website at http://www.edpubs.org/." (**DHS**, "Fact Sheet: Creating a Culture of Preparedness Among Schools." October 30, 2007.)

SAFECOM: "SAFECOM, a communications program of the Department of Homeland Security's Office for Interoperability and Compatibility (OIC), with its Federal partners, provides research, development, testing and evaluation, guidance, tools, and templates on communications-related issues to local, tribal, state, and Federal emergency response agencies. OIC is managed by the Science and Technology Directorate. As an emergency responder driven program, SAFECOM is working with existing Federal communications initiatives and key emergency response stakeholders to address the need to develop better technologies and processes for the multi-jurisdictional and cross-disciplinary coordination of existing systems and future networks. SAFECOM harnesses diverse Federal resources in service of the emergency response community." (**DHS**, *Welcome to SAFECOM*, accessed October 22, 2007)

Safety: Safety, in the traditional sense, refers to monitoring and reducing the risk of personnel casualties (injuries and deaths) to some acceptable level. (**Shaw** forthcoming)

Safety Culture (REP): "... that assembly of characteristics and attitudes in organizations and individuals which establishes that, as an overriding priority, nuclear plant safety issues receive the attention warranted by their significance." (NRC, *Enforcement Program Annual Report, Calendar Year 2006,* June 6, 2007, page 13)

Safety Officer: "A member of the Command Staff responsible for monitoring and assessing safety hazards or unsafe situations and for developing measures for ensuring personnel safety. The Safety Officer may have assistants." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 57)

Saffir/Simpson Hurricane Scale: A scale for expressing the relative intensity of hurricanes, consisting of five levels of increasing intensity—Categories 1 through 5. (**Notification Manual**)

Saffir/Simpson Hurricane Scale[117]

Storm Category	Wind Speed (mph)	Storm Surge (ft)	Damage	Millibars
1	74-95	4-5	Minimal	> 979
2	96-110	6-8	Moderate	965-979
3	111-130	9-12	Extensive	945-964
4	131-155	13-18	Extreme	920-944
5	> 155	> 18	Catastrtophic	< 920

Sahana (Home of the Free and Open Source Disaster Management System)**:** "Sahana is an integrated set of pluggable, web based disaster management applications that provide solutions to large-scale humanitarian problems in the aftermath of a disaster. Our aspirations are as follows:

- *Primary:* Help alleviate human suffering and help save lives through the efficient use of IT during a disaster
- Bring together a diverse set of actors from Government, Emergency Management, NGOs, INGOs, spontaneous volunteers and victims themselves in responding effectively to a disaster
- Empower the victims, responders, volunteer to better enable them to help themselves and others
- Protect victim data and reduce the opportunity for data abuse
- Provide a Free and Open Source solution end-to-end available to everyone

With the above aspirations, the main applications built into Sahana and problems they address so far are as follows:

[117] Blake, Rappaport, and Landsea. *The Deadliest, Costliest, and Most Intense US Cyclones, 1851-2006*, 2007, 2)

- **Missing Person Registry** - Helping to reduce trauma by effectively finding missing persons
- **Organization Registry** - Coordinating and balancing the distribution of relief organizations in the affected areas and connecting relief groups allowing them to operate as one
- **Request Management System** - Registering and Tracking all incoming requests for support and relief upto fulfillment and helping donors connect to relief requirements
- **Camp Registry** - Tracking the location and numbers of victims in the various camps and temporary shelters setup all around the affected area
- **Volunteer Management** - Coordinate the contact info, skills, assignments and availability of volunteers and responders
- **Inventory Management** - Tracking the location, quantities, expiry of supplies stored for utilization in a disaster
- **Situation Awareness** - Providing a GIS overview of the situation at hand for the benefit of the decision makers. (**Sahana**, *Vision and Objectives*, 2005)

Sanitary Cordon: "A form of quarantine that restricts movement into or out of a region." (**ACLU**, *Pandemic Preparedness*, 2008, 30)

SANS: Ship Arrival Notification System. (**USCG**, *Port Security Assessment Program*)

SAO: State Approving Official. (**FEMA**, *Mission Assignment SOPs Operating Draft*, 2007, 2)

SAR: Search and Rescue. (**HSGAC**, *Hurricane Katrina:* A *Nation Still Unprepared*, 2006, 634)

SAR: Suspicious Activity Reporting. (**DHS**, *IPG FY 2011-2015 Draft* 2008, p. 22)

SAR On-Scene Coordinator (SAR OSC): "The SAR OSC coordinates the SAR mission on-scene using the resources made available by SMC and should safely carry out the SAR Action Plan. The SAR OSC may serve as a Branch Director or Group Supervisor to manage on-scene operations after the SAR mission is concluded and other missions continue, such as search and recovery." (**USCG**, *IM Handbook*, 2006, Glossary 25-21)

SARBOO: Search and Rescue Base of Operations. (**HSGAC**, *Nation Unprepared*, 2006, 634)

SARA: Superfund Amendments and Reauthorization Act of 1986.

Sarin: "Sarin is a human-made chemical warfare agent classified as a nerve agent. Nerve agents are the most toxic and rapidly acting of the known chemical warfare agents. They are similar to certain kinds of pesticides (insect killers) called organophosphates in terms of how they work and what kind of harmful effects they cause. However, nerve agents are much more potent than organophosphate pesticides. Sarin originally was developed in 1938 in Germany as a pesticide. Sarin is a clear, colorless, and tasteless liquid that has no odor in its pure form. However, Sarin can evaporate into a vapor (gas) and spread into the environment. Sarin is also known as GB." (**CDC**, *Facts About Sarin*, May 17, 2004 Update)

SASP: State Agency for Surplus Property.

SARS: Severe Acute Respiratory Syndrome.

Satellite Joint Information Center (JIC): "A satellite JIC is smaller in scale than other JICs. It is established primarily to support the incident JIC and to operate under their direction. These are subordinate JICs, which are typically located closer to the scene. (**FEMA**, *Basic Guidance for PIOs*, Nov 2007, 16)

SAVER: System Assessment and Validation for Emergency Responders. (**DHS**, *SAVER*, 2006)

SBA. Small Business Administration.

SBCCI: Southern Building Code Congress International, Inc.

SBCCOM: Soldier and Biological Chemical Command, U.S. Army.

SBI: Secure Border Initiative, DHS. (**DHS/OIG**, Risk Management Advisory…SBInet, 2006)

SBInet (Secure Border Initiative): A Customs and Border Protection program "intended to improve border control operations, deploying more infrastructure and personnel with modernized technology and tactics. (DHS/OIG, *Risk Management Advisory for the SBInet…,* Nov 2006, p. 2)

SBU: Sensitive but Unclassified. (**DHS**, *Procedural Manual…CVI*, June 2007, p. 4)

SCADA: System Controls and Data Acquisition.

Scalability: "The ability of incident managers to adapt to incidents by either expanding or reducing the resources necessary to adequately manage the incident, including the ability to incorporate multiple jurisdictions and multiple responder disciplines." (**FEMA**, *NIMS Compliance Metrics Terms of Reference* (For Fiscal Year 2007), October 23, 2006, p. 9)

Scalable, Flexible, and Adaptable Operational Capabilities – Third of 5 Key NRF Principles: "As incidents change in size, scope, and complexity, the response must adapt to meet requirements. The number, type, and sources of resources must be able to expand rapidly to meet needs associated with a given incident. The *Framework*'s disciplined and coordinated process can provide for a rapid surge of resources from all levels of government, appropriately scaled to need. Execution must be flexible and adapted to fit each individual incident. For the duration of a response, and as needs grow and change, responders must remain nimble and adaptable. Equally, the overall response should be flexible as it transitions from the response effort to recovery. This *Framework* is grounded in doctrine that demands a tested inventory of common organizational structures and capabilities that are scalable, flexible, and adaptable for diverse operations. Adoption of the *Framework* across all levels of government and with businesses and NGOs will facilitate interoperability and improve operational coordination." (**DHS**, *NRF*, Jan 2008, 10)

SCBA: Self-Contained Breathing Apparatus. (**DA**, *WMD-CST Operations*, 2007, Glossary-6)

SCCs: Sector Coordinating Councils – "…comprised of private sector representatives." Relate to the National Infrastructure Protection Plan. (**DHS**, *NIPP*, 2006, p. 4)

SCEC: Southern California Earthquake Center.

Scenario: "A scenario provides the backdrop and storyline that drive an exercise. The first step in designing a scenario is determining the type of threat/hazard (e.g., chemical, explosive, cyber, natural disaster) to be used in an exercise. The hazards selected for an exercise should realistically stress the capabilities a jurisdiction is attempting to improve through its exercise programs. A hazard should also be a realistic representation of potential threats faced by the exercising jurisdiction. For *discussion-based* exercises, a scenario provides the backdrop that drives *participant* discussion. For *operations-based* exercises, the scenario should provide background information on the incident catalyst of the exercise. For *prevention* exercises, the scenario should include the *Ground Truth*." (**FEMA**, *Homeland Security Exercise and Evaluation Program Glossary*, 2008)

Scenario-Based Planning: "A scenario-based plan is developed from a National Planning Scenario; there are currently 15 National Planning Scenarios. These scenarios have been grouped into eight sets. National Planning Scenarios will be developed, updated, or amended as necessary at least every two years. This process will be informed by a risk-based analysis intended to focus planning efforts on the most likely or most dangerous threats to the homeland. Annex I to HSPD-8 specifically addresses this planning approach." (**FEMA**, *Interim IPS* (Draft 2.3), July 3, 2008 copy, p. 2-11)

Scenario-Driven Catastrophic Response Plan Development Process Concept: "The Scenario-Driven Catastrophic Response Plan Development Process, which will be used in the NMSZ Catastrophic Planning effort, is unique. This process places operators in the same room with planners to develop plans based on real-world modeling. In other words, the people who respond to a disaster are integrally involved in writing the plan that they will eventually use. Representatives from the entire spectrum of emergency management, first responders from the local level, state emergency management officials, and the Federal responders that staff the Joint Field Offices and other field offices, collaborate to develop the plan in a manner similar to the way that they work together in responding to an incident.

"The scenario-driven planning concept combines the planning and exercise phases of plan development through a workshop format. Breakout rooms and action rooms are used to develop topic-specific plans. The accelerated process results in functional plans ready for immediate use. Examples of the diverse functional planning areas addressed in the breakout rooms include Direction and Control; Search and Rescue; Temporary Medical Care; Evacuation; Temporary Housing; and Security. The Scenario-Driven Catastrophic Planning process promotes communication and builds stronger relationships between Federal, State, local, and volunteer agencies that ultimately enhances the interoperability of plans. Participants at all levels of government take ownership of the plans, and the operational knowledge and experience captured make those plans more viable." (**FEMA**, *NMSZ Catastrophic Planning Project Overview*, 2007)

Scenario-Driven Exercise/Planning Process versus Traditional Exercise/Planning Process:

- Traditional Exercise Process
  - Exercise Planning
  - Conduct and Evaluate the Exercise
  - Analyze Exercise Data
  - Issue After Action Report
  - Implement Recommendations and Update Plans
    - Can Take Months for Updates, etc.
- Scenario Based Workshops
  - Workshop Planning
  - Conduct the Workshop
  - Issue Functional Plans
  - Implement Functional Plans
    - Less Steps – Faster Results
    - The Scenario-Driven Planning Process produces functional plans "On the Spot." (**FEMA** *Catastrophic Disaster Planning IAEM Conf. Pre*sentation, 12Nov2007, slides 61-62)

Scenario Planning: "One time-tested tool available to companies to deal with the prevailing uncertainty is scenario planning. A powerful risk management technique originally developed by Royal Dutch/Shell to deal with oil production and price shocks, scenario planning involves imagining different versions of the future and mapping out strategic responses should one or more of those versions become reality. The goal of scenario planning is not to predict the future; it is to anticipate more than one possible future and prepare plans to cope with it. Bain & Co., a consulting firm, says scenario planning 'allows users to explore the implications of several alternative futures. This avoids the dangers of single-point forecasts. Having examined the full range of possible futures, a company can more rapidly modify its strategic direction as actual event unfold'." (**Knowledge Wharton**, *Using Scenario Planning*…, December 5, 2001)

Scenario Planning: "Scenario planning is best described as creating stories of equally plausible futures and planning as though any one could move forward. Key indicators are built in to signal movement of one option over another. This is not a new phenomenon but one that has taken on added importance with the volatility of today's environment. The use of scenarios dates back to post-World War II strategy in which the military tried to determine what opponents might do and how the United States would respond." (**Tucker**, *Scenario Planning*, Association Mgmt., 1999)

SCH: Shelter Complex Headquarters. (**OCD**, Abbreviations, 1971, 4) [Program defunct]

SCI: Sensitive Compartmented Information. (**FEMA** *IIFOG Version 3*, Feb 2008, 28)

SCIF: Sensitive Compartmented Information Facility. (**FEMA** *IIFOG Version 3*, Feb 2008, 22)

SCIP: Statewide Communication Interoperability Plan. (**DHS/OEC**, *OEC Slide Presentation*, Communications Interoperability Policy Academy, 2007)

SCIP: Strategy for Catastrophic Incident Planning. (**FEMA**, *Strategic Plan*, Oct.10, 2007, p. 3)

SCM: Survivable Crisis Management. (**FEMA**, *An Introduction to SCM*, September 1992).

SCO: Screeing Coordination Office, Office of Policy, DHS. (**DHS**, *IPG FY 2011*…, 2008, 27)

SCO: State Coordinating Officer.

Screening: A DHS "Functional Area": "Performing physical and information-based screening of cargo and people and their belongings (baggage, conveyance) in order to identify cargo and individuals who may pose a threat and/or are ineligible for access; detecting objects which may pose a threat; granting or verifying a license, privilege, or status (physical or virtual); and, ensuring individual privacy and redress opportunities." (**DHS**, *IPG FY 2011-2015*, 2008, 11)

SDME: Strategic Decision Making Exercise. (**Army War College**, Carlisle, PA)

Sea, Lake, Overland, Surge from Hurricanes (SLOSH) Model: "…a computerized model developed by the Federal Emergency Management Agency (FEMA), United States Army Corps of Engineers (USACE), and the National Weather Service (NWS) to estimate storm surge depths resulting from historical, hypothetical, or predicted hurricanes by taking into account a storm's pressure, size, forward speed, forecast track, wind speeds, and topographical data. SLOSH is used to evaluate the threat from storm surge, and Emergency managers use this data to determine which areas must be evacuated. SLOSH output is used by the National Hurricane Program (NHP) when conducting Hurricane Evacuation Studies as a hazard analysis tool for assisting with the creation of state and local hurricane evacuation plans or zones. SLOSH model results are combined with roadway network and traffic flow information, rainfall amounts, river flow, or wind-driven waves to determine a final analysis of at-risk areas. Storm surge also can affect rivers and inland lakes, potentially increasing the area that must be evacuated." (**FEMA**, *SLOSH*, Nov 27, 2007)

Sea Surge: "A rise in sea level that results in the inundation of areas along coastlines. These phenomena are caused by the movement of ocean and sea currents, winds and major storms." (**UNDHA**, *DM Glossary*, 1992, 66; cites OFDA)

SEAR: Special Event Assessment Report. (**DHS**, *Interagency Planning Workshop*, Nov. 29, 2007)

Search and Rescue: "The process of locating and recovering disaster victims and the application of first aid and basic medical assistance as may be required." (**UNDHA**, *DM Glossary*, 1992, 66)

SECDEF: Secretary of Defense. (**OCD**, *Abbreviations and Definitions*, 1971, p. 4)

SECDHS: Secretary of the Department of Homeland Security.

Second Line of Defense Program, DOE: "DOE's Second Line of Defense Program…seeks to prevent smuggling of nuclear warheads overseas." (**DHS/OIG**, *DHS DNDO Progress*, 2007, 10)

Second Stage Review (2SR): "In one of his first actions as Secretary of Homeland Security…Michael Chertoff, on March 2, 2005, the day before he was sworn in as Secretary, announced in testimony before the House Appropriations Subcommittee on Homeland Security that he was "initiating a comprehensive review of the Department's organization, operations, and policies." This effort, he said, would begin "within days." The results of that undertaking, which came to be known as the Second Stage Review or 2SR, were made public in mid-July." (CRS, *Department of Homeland Security Reorganization: The 2SR Initiative*, August 19, 2005, p. i)

"…in July 2005, Secretary of Homeland Security Michael Chertoff announced plans for a reorganization of DHS, including FEMA. Known as the "Second Stage Review," or "2SR," the reorganization transferred emergency preparedness functions from FEMA to a new Preparedness Directorate, among other changes. The Administration began implementation of the reorganization on October 1, 2005. In response to Administration requests, congressional support for the proposal was provided through approval of the FY2006 appropriations legislation." (**CRS**, *Federal Emergency Management and Homeland Security Organization: Historical Developments and Legislative Options*, June 1, 2006)

"…to ensure that our preparedness efforts do have a focused direction, we intend to consolidate all the Department's existing preparedness efforts -- including planning, training, exercising and funding -- into a single directorate led by an under secretary for preparedness. Going forward, FEMA will be a direct report to the Secretary, and it will focus on its historic and vital mission of response and recovery -- a mission that it performs superbly. The importance of this latter capacity was illustrated powerfully as Hurricane Dennis made landfall this past week." (**DHS**, *Secretary Michael Chertoff [DHS] Second Stage Review Remarks*, July 13, 2005)

"The Secretary's six-point agenda will guide DHS in the near term and result in changes that will:

- Increase overall preparedness, particularly for catastrophic events;
- Create better transportation security systems to move people and cargo more securely and efficiently;
- Strengthen border security and interior enforcement and reform immigration processes;
- Enhance information sharing with our partners;
- Improve DHS financial management, human resource development, procurement and information technology; and
- Realign the DHS organization to maximize mission performance….

- Improve National Response and Recovery Efforts by Focusing FEMA on Its Core Functions. FEMA will report directly to the Secretary of Homeland Security. In order to strengthen and enhance our Nation's ability to respond to and recover from manmade or natural disasters, FEMA will now focus on its historic and vital mission of response and recovery." (**DHS**, "Homeland Security Secretary Michael Chertoff Announces Six-Point Agenda for [DHS]," July 13, 2005)

Secondary Hazards: "Those hazards that occur as a result of another hazard or disaster, i.e., fires or landslides following earthquakes, epidemics following famines, food shortages following drought or floods." (**UNDHA**, *DM Glossary*, 1992, 66)

Secretary of Homeland Security: "The Secretary of Homeland Security is the principal Federal official for domestic incident management. Pursuant to the Homeland Security Act of 2002 the Secretary is responsible for coordinating Federal operations within the United States to prepare for, respond to, and recover from terrorist attacks, major disasters, and other emergencies. The Secretary shall coordinate the Federal Government's resources utilized in response to or recovery from terrorist attacks, major disasters or other emergencies if and when any one of the following four conditions applies: (1*)* a Federal department or agency acting under its own authority has requested the assistance of the Secretary; (2) the resources of State and local authorities are overwhelmed and Federal assistance has been requested by the appropriate State and local authorities; (3) more than one Federal department or agency has become substantially involved in responding to the incident; or (4) the Secretary has been directed to assume responsibility for managing the domestic incident by the President." (**White House**, *HSPD-5*, February 28, 2003)

Secretary's Playbooks (NRF): "…CONPLANs form the basis for the [DHS] Secretary's *Playbooks*, detailed checklists for executives that the Secretary of Homeland Security uses to ensure a coordinated response to domestic incidents. The Secretary's *Playbooks* are designed for the Secretary of Homeland Security, as the principal Federal official for domestic incident management, to monitor the response to the threats described in the 15 National Planning Scenarios, ensure coordination among Federal departments and agencies, detect potential shortfalls in response efforts or interagency coordination and surface anticipated policy issues to Federal department and agency executive leadership and the President for resolution." (**DHS** *NRF Comment Draft*, September 2007, p. 72)

Section: [In ICS/NIMS] "That organization level having functional responsibility for primary segments of an incident such as: Operations, Planning, Logistics and Finance. The Section level is organizationally between Branch and Incident Commander." (**USCG**, *IM Handbook* 2006, Glossary 25-22)

Sector: "A term similar to an ICS Division or Group (either a geographic or functional assignment). Sector is not a part of ICS terminology." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 57)

Sector Coordinating Council: "The private sector counterpart to the GCCs, these councils are self-organized, self-run, and self-governed organizations that are representative of a spectrum of key stakeholders within a sector. SCCs serve as the government's principal point of entry into each sector for developing and coordinating a wide range of CI/KR protection activities and issues." (**DHS**, *NIPP*, 2006, 105)

Sector-Specific Agency: "Federal departments and agencies identified in HSPD-7 as responsible for CI/KR protection activities in specified CI/KR sectors." (**DHS**, *NIPP*, 2006, p. 105)

Sector-Specific Plan: Augmenting plans that complement and extend the NIPP Base Plan and detail the application of the NIPP framework specific to each CI/KR sector. SSPs are developed by the SSAs I close collaboration with other security partners." (**DHS**, *NIPP*, 2006, p. 105)

Secure Border Initiative: "In the fall of 2005, the White House and the department announced the Secure Border Initiative (SBI), a comprehensive multi-year effort to secure the borders and reduce illegal immigration, which included a U.S. Immigration and Customs Enforcement led plan to increase and improve the apprehension, detention, and removal of illegal aliens; a U.S. Citizenship and Immigration Service led plan for expanding the guest worker program and streamlining immigration benefits processes; and a U.S. Customs and Border Protection (CBP) led program to gain control of the nation's land borders." (**DHS/OIG**, *Risk Management Advisory for the SBInet Program Initiation*, November 2006, p. 2)

Securing: The 2nd DHS "Functional Area": "Deploy preventative measures (both tools and techniques) to reduce physical and cyber vulnerabilities and the impact of threats to America's key assets and infrastructure. (e.g. heightened security based on a targeted threat, physical barriers based on an asset's vulnerability, etc.) Strategic use/placement of guards and physical barriers to reduce the vulnerability of an asset/event/person and allowing the lawful entry of individuals into the physical space/area." (**DHS**, *IPG FY 2011-2015 Draft*, 2008, 13

Securing the Cities Initiative (DHS): "…we are now looking in our strategy to go beyond the question of securing our borders, to look at the issue of how do we secure the interior: How do we protect cities, major urban areas in this country from a nuclear or a radiological bomb that was fabricated inside the country? How do we prevent someone from getting a hold of radioactive material in the U.S., making a dirty bomb, and then trying to detonate it in New York, or Chicago, or Los Angeles?...to address that next level of concern, we are unveiling our Securing the Cities Initiative, which is a program to see how we can deploy this kind of detection equipment [Advanced Spectroscopic Portal Program] not only at seaports and ports of entry by land, but in cities and around cities, so we could detect a truck coming into a city with a dirty bomb, even if it didn't cross an international border… we are currently working with the city of New York, with the police department…to begin the process of planning and deploying a pilot of this Securing the Cities system of internal radiation-detection equipment, so we can move to this comprehensive coverage of protection against nuclear threats. That, I think, is one of the highest priorities for this Department and for this administration." (**DHS**, *Remarks by Homeland Security Secretary Michael Chertoff and DNDO Director Vayl Oxford at a Press Conference to Announce Spectroscopic Portal (ASP) Program Contracts*, July 14, 2006)

Securing the Cities Initiative (DHS): "The office that oversees Securing the Cities was created in 2006 with the support of Vice President Cheney, and its $485 million 2008 budget is the largest part of the DHS's shrinking research portfolio, which includes aviation security, explosives and bio-defense." Security Cities share is a reported estimated $90 million. (**Hsu,** *Securing the Cities No Easy Task*, Feb 3, 2008)

Security: Security in the traditional sense refers to monitoring and reducing the risk of human induced events that adversely affect people or property (intrusion of unauthorized personnel, theft, sabotage, assault, etc.), to some acceptable level. (**Shaw** 1999)

Security and Prosperity Partnership (SPP) of North America, Homeland Security Aspect: "The SPP is a US Presidential initiative with DOD equities. The SPP agreement, designed to reduce barriers on trade and facilitate economic growth while improving the security of the continent, was signed on 23 March 2005 by the President of the United States, the Prime Minister of Canada, and the President of Mexico. DHS and the Homeland Security Council are the lead agencies for the agreement's security components, with DOD as a supporting agency. The SPP Action Plan addresses goals and objectives associated with homeland security to include "Protection, Prevention, and Response." One of the goals of the agreement is to "develop and implement a common approach to critical infrastructure protection, response to cross-border terrorist incidents, and as applicable, natural disasters." This includes a dual-binational (US/Canada and US/Mexico) objective on emergency management cooperation to develop and implement joint plans for cooperation in incident response, as well as conduct joint training and exercises in emergency response. This includes the development of a plan to build and strengthen mechanisms, protocols, and agreements for communicating and coordinating emergency response for mutual assistance and cooperation in the event of natural and technological/industrial disasters or malicious acts involving chemical, biological, radiological, nuclear, or high-yield explosives devices and hazards." (**JCS/DOD,** *CBRNE CM*, 2006, IV-16)

Security Vulnerability Assessment (SVA): The Security Vulnerability Assessment (SVA) is a new application of the CSAT [Chemical Security Assessment Tool]. The SVA is a tool used for the evaluation of the potential consequences and vulnerabilities of specific critical Privacy Impact Assessment Update National Protection & Programs Directorate facility assets against a standard set of potential attack scenarios. The CSAT Top-Screen collects information, but not PII, and uses it to identify critical assets selected for the SVA. CSAT uses the SVA results to assign the facility a tier level and identify security gaps that the facility will need to address in the SSP." (**DHS**, *Privacy Impact Assessment Update for the Chemical Security Assessment Tool (CSAT)*, May 25, 2007, pp. 3-4)

SEHS: Special Event(s) for Homeland Security. (**JCS/DoD**, *Civil Support*, 2007, p. GL-11)

Seiche: "A free or standing wave oscillation of the surface of water in an enclosed basin that is initiated by local atmospheric changes, tidal currents or earthquakes." (**UNDHA**, *DM Glossary*, 1992, 66)

Seismic Belt: "An elongated earthquake zone, usually located along the boundaries of tectonic plates." (**UNDHA**, *DM Glossary*, 1992, 67)

Seismic Hazard: "The potential for damaging effects caused by earthquakes. The level of hazard depends on the magnitude of likely quakes, the distance from the fault that could cause quakes, and the type of ground materials at a site." (**USGS**, *Putting Down Roots*, 2007, Glossary)

Seismic Risk: "The chance of injury, damage, or loss resulting from seismic hazards. There is no risk, even in a region of high seismic hazard, if there are no people or property that could be injured or damaged by a quake." (**USGS**, *Putting Down Roots*, 2007, Glossary)

Seismicity: "The distribution of earthquakes in space and time (UNDRO)." (**UNDHA**, *DM Glossary*, 1992, 67)

Seismograph: "An instrument for recording vibratory motion of the ground (OFDA)." (**UNDHA**, *DM Glossary*, 1992, 67)

SEL: Standard Equipment List.

Seminar: "A seminar is an informal discussion, designed to orient participants to new or updated plans, policies, or procedures (e.g., a seminar to review a new Evacuation Standard Operating Procedure)." (**FEMA**, *About HSEEP*, 2008)

Seminar: "Seminars orient *participants* to authorities, strategies, plans, policies, procedures, protocols, resources, concepts, and/or ideas. Seminars provide a good starting point for jurisdictions that are developing or making major changes to their plans and procedures." (**FEMA**, *Homeland Security Exercise and Evaluation Program Glossary*, 2008)

Semi-Quantitative Analysis: "In semi-quantitative analysis, qualitative scales are given values. The objective is to produce a more expanded ranking scale than is usually achieved in qualitative analysis, not to suggest realistic values for risk such as is attempted in quantitative analysis. However, since the value allocated to each description may not bear an accurate relationship to the actual magnitude of consequences or likelihood, the numbers should only be combined using a formula that recognizes the limitations of the kinds of scales used. The limitations of the approach are that the numbers chosen may not properly reflect relativities and this can lead to inconsistent or inappropriate outcomes and semi-quantitative analysis may not differentiate properly between risks, particularly when either consequences or likelihood are extreme." (**UNDAP**, *Techniques Used in Disaster Risk Assessment*, 2008)

SEMS: Standardized Emergency Management System (California). (**Little Hoover**, 2007, 8)

Senior Federal Law Enforcement Official (SFLEO): "The SFLEO is an official appointed by the Attorney General during an incident requiring a coordinated Federal response to coordinate all law enforcement, public safety and security operations with intelligence or investigative law enforcement operations directly related to the incident. The SFLEO is a member of the Unified Coordination Group and, as such, is responsible to ensure that allocation of law enforcement requirements and resource allocations are coordinated as appropriate with all other members of the Group. In the event of a terrorist incident, the SFLEO will normally be a senior FBI official, who has coordinating authority over all law enforcement activities related to the incident, both those falling within the Attorney General's explicit authority as recognized in HSPD-5 and those otherwise directly related to the incident itself**.**" (**DHS**, *NRF Draft*, 2007, 65; *NRF*, 2008, 68)

Senior Federal Official (SFO): "An individual representing a Federal department or agency with primary statutory responsibility for incident management. SFOs utilize existing authorities, expertise and capabilities to aid in management of the incident working in coordination with other members of the JFO Coordination Group." (**FEMA**, *Mission Assignment SOPs*, 2007, 60)

Senior Federal Official (SFO): "A SFO is an individual representing a Federal department or agency with primary statutory responsibility for incident management." (**USCG**, *IM Handbook*, 2006, Glossary 25-22)

Senior Leadership Group: "It is comprised of key DHS officials across the major components and intended to provide a forum for the Secretary to obtain critical advice from those with the most direct incident management responsibilities, to communicate decisions, to facilitate the integration and coordination of intradepartmental operational missions, activities, and programs at the headquarters level; and to assist in resolving intradepartmental issues. The group convenes as necessary, such as during an actual incident or major exercise, although the Secretary or the Director of Operations Coordination may convene the group at any time. (**GAO**, *Homeland Security: Guidance from Operations Directorate Will Enhance Collaboration...,* 20Jun07, 17)

Sensible Security: "Sensible security is the level of protection achieved through design, construction, and operation that mitigates adverse impact to systems, facilities, and assets in proportion to their value to society and their likelihood of being affected by natural and/or man-made events." (**TISP**, *Regional Disaster Resilience*, 2006, p. 2)

Sensitive Compartmented Information (SCI): "A restricted access control system. It is a level of access to classified information compartments/programs, and not a level of Classification. The SCI access control system applies to all three levels of classified information (Top Secret, Secret, Confidential). SCI access is usually based upon the sensitivity of the involved sources and/or methods." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, 39)

Sensitive Compartmented Information Facility (SCIF): "An accredited area, room, group of rooms, or installation where SCI may be stored, used, discussed, and/or electronically processed. SCIF procedural and physical measures prevent the free access of persons unless they have been formally indoctrinated for the particular SCI authorized for use or storage within the SCIF." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, 39)

Sensitivity Analysis: "Sensitivity analysis can help gauge what effects key sources of uncertainty have on outcomes, which provides decision makers with additional data on alternative risk estimates and funding allocations resulting from analyses of varying data, judgments, and assumptions." (GAO, *Homeland Security*: *DHS Improved its Risk-Based Grant Programs' Allocation and Management Methods...,*, March 11, 2008, p. 9)

SEOC: State Emergency Operations Center.

SEP: Special Events Planning.

SEPCTTF: Southeastern PA Counter-Terrorism Task Force. (**FEMA,** *Region III Report 2007*, 30)

September 10 Mentality: "…despite the images of 9/11 -- when the Twin Towers fell, the Pentagon burned, and a field in Shanksville, Pa., was found smoldering and silent -- we see some quarters returning to a "September 10 mentality." There are some who oppose key 9/11 Commission recommendations and congressional mandates such as secure driver's licenses and

travel documents, and some public intellectuals have joined like-minded press pundits in downplaying the threats we still confront…. We must begin by charting a resolute course between hysteria and complacency. "Let us remind ourselves that we are ultimately locked in a battle of ideas, centered on one key question: Is freedom a dangerous luxury that can be denied at will -- or is it the birthright of every person and the ultimate basis for security? Our enemies answer one way; our founding creed tells us otherwise." (**Chertoff and Ridge**, "Homeland Security Confidence." *Sacramento Bee*, March 6, 2008)

SERC: State Emergency Response Commission. (EPA, *Technical Guidance for Hazards Analysis*, 1987, p. 1-4)

Serious Incident Report (SIR): Used "to convey flash traffic to the commander and command post relating to an accident or serious incident within the command." (**DA**, *WMD-CST Operations*, Dec. 2007, p. G-12)

SERRI: Southeast Region Research Initiative. (**ORNL**, *SERRI*, 2008)

SERT: Secretary's Emergency Response Team, HHS. (**FEMA**, *Federal Interim CONPLAN NMSZ,* December 2007, p. B-3)

Service Animal: "Any guide dog, signal dog, or other animal individually trained to provide assistance to an individual with a disability including, but not limited to, guiding individuals with impaired vision, alerting individuals with impaired hearing to intruders or sounds, providing minimal protection or rescue work, pulling a wheelchair, or fetching dropped items." (**FEMA**, *Eligible Costs Related to Pet Evacuations and Sheltering*, 2007)

Service Branch (ICS): "A branch within the Logistics Section responsible for service activities at the incident including the Communications Unit, Medical Unit and Food Unit." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 57)

SE&T: Supplies, Equipment and Training. (OCD, Abbreviations, 1971, p. 4) [Program defunct]

Seven National Priorities, National Preparedness Goal: "These seven priorities reflect a limited number of the cross-cutting initiatives and critical capabilities that should drive near-term planning and resource allocation efforts. The National Priorities are intended to guide the Nation's preparedness efforts to meet its most urgent needs, and fall into two categories: (1) overarching priorities that contribute to the development of multiple capabilities, and (2) capability-specific priorities that build selected capabilities for which the nation has the greatest need:

National Priorities Overarching Priorities
• Implement the National Incident Management System and National Response Plan
• Expanded Regional Collaboration
• Implement the Interim National Infrastructure Protection Plan

Capability-Specific Priorities

• Strengthen Information Sharing and Collaboration capabilities
• Strengthen Interoperable Communications capabilities
• Strengthen CBRNE Detection, Response, and Decontamination capabilities
• Strengthen Medical Surge and Mass Prophylaxis capabilities." (**DHS/ODP**, *State and Urban Area Homeland Security Strategy: Guidance on Aligning Strategies with the NPG*, 2005, p. 6)

Severe Repetitive Loss (SRL) Pilot Program, FEMA National Flood Insurance Program: "The Severe Repetitive Loss (SRL) Pilot Program…provides funding to reduce or eliminate the long-term risk of flood damage to severe repetitive loss residential structures insured under the National Flood Insurance Program (NFIP). The definition of severe repetitive loss as applied to this program was established in section 1361A of the National Flood Insurance Act, as amended (NFIA), 42 U.S.C. 4102a. An SRL property is defined as a **residential property** that is covered under an NFIP flood insurance policy and:
(a) That has at least four NFIP claim payments (including building and contents) over $5,000 each, and the cumulative amount of such claims payments exceeds $20,000; or
(b) For which at least two separate claims payments (building payments only) have been made with the cumulative amount of the building portion of such claims exceeding the market value of the building.
For both (a) and (b) above, at least two of the referenced claims must have occurred within any ten-year period, and must be greater than 10 days apart.
The long-term goal of the SRL program is to reduce or eliminate claims under the NFIP. The SRL program will fund mitigation projects, which will result in the greatest savings to the National Flood Insurance Fund (NFIF) in the shortest period of time, based on a Benefit-Cost Ratio (BCR) using Federal Emergency Management Agency (FEMA)-approved methodology to conduct the Benefit-Cost Analysis (BCA).
Participation in this program is voluntary. The SRL program differs from other FEMA mitigation grant programs in that those property owners who decline offers of mitigation assistance will be subject to increases in their insurance premium rates.
The SRL program was created pursuant to Section 1361A of the National Flood Insurance Act of 1968 (or "the Act"), 42 U.S.C. 4102A, as amended by the Bunning-Bereuter-Blumenauer Flood Insurance Reform Act of 2004, Public Law 108-264, with the goal of reducing flood damages to SRL properties. The Catalog of Federal Domestic Assistance (CFDA) number for the SRL program is 97.110. FEMA published the interim final rule for the SRL program in the *Federal Register* at 72 FR 61720 on October 31, 2007. The regulations are codified at 44 C.F.R. Part 79." (**FEMA**, *Severe Repetitive Loss (SRL) Pilot Program Guidance*, 14Jan2008, p. vii)

Severe Weather: Any atmospheric condition potentially destructive or hazardous form human beings. It is often associated with extreme convective weather (tropical cyclones, tornadoes, severe thunderstorms, squalls, etc.) and with storms of freezing precipitation or blizzard conditions. (**WMO** 1992, 544)

SEWG: Special Events Working Group, DHS. (**DHS**, Statement of Rufe, July 9, 2008, p. 1)

SFHA: Special Flood Hazard Area. (**FEMA**, *SFHA*, 2007)

SFIP: Standard Flood Insurance Policy. (**FEMA**, *Call for Issues Status Report*, 2000, xxiii)

SFLEO: Senior Federal Law Enforcement Official. (**HSGAC**, A *Nation Unprepared*, 2006, 634)

SFO: Senior FEMA Official. (**FBI**, *USG Interagency Domestic Terror. CONPLAN*, 2001, A-1)

SFPC: Structural Fire Fighters' Protective Clothing.

Shadow Evacuation: "…some people may evacuate even though they are not officially considered to be at risk. Known as an 'evacuationo shadow.' This spontaneious evacuation is prompted when people feel they are in danger and begin to leave in advance of, or in spite of, official instructions to avoid doing so (Wolshon, Hamilton, Wilmot et al., 2005; Mitchell, Cutter, and Edmonds, 2007). Shadow evacuations are not a new phenomenon. During the 1999 Hurricane Floyd evacuations in Florida, it was estimated that about one-half of the 2 million persons who evacuated were shadow evacuees (Ballingrund, 2000)." (Kendra, Evacuating Large Urban Areas, 2008, 5)

Shear Wall: "A structural element which resists lateral forces." (**UNDHA**, *DM Gloss.* 1992, 68)

Shelter: "Physical protection requirements of disaster victims who no longer have access to normal habitation facilities. Immediate post-disaster needs are met by the use of tents. Alternatives may include polypropylene houses, plastic sheeting, geodesic domes and other similar types of temporary housing." (**UNDHA**, *DM Glossary*, 1992, 68)

Shelter-in-Place: "Definition: taking emergency refuge within the nearest designated safe area until notification or determination that the situation has been resolved

"Extended definition: a precaution intended to keep people safe while remaining indoors where the shelter area is preferably a small interior room with no windows and may require efforts of sealing all cracks or openings with tape or other materials

"Annotation: Sheltering-in-place is used when evacuating the public would cause greater risk than staying where they are, or when an evacuation cannot be performed.

"Example: The preferred locations for any shelter-in-place action are interior rooms of the building that have no windows." (**DHS**, *Lexicon*, October 19, 2007, p. 24)

Shelter-in-Place: "Depending on the nature and timing of a catastrophe, emergency managers may warn people of whether it is safer to evacuate or to shelter in place. In an evacuation, people leave their homes and businesses and travel to a safe location away from danger. In some instances, it is safer for people to quickly seek shelter indoors—in homes, schools, businesses, or public buildings—than to try to travel. Shelter-in-place would be used when there is little time to react to an incident and it would be more dangerous to be outside trying to evacuate than to stay indoors for a short period of time. Additional protective actions that the emergency managers may recommend would include turning off air conditioners and ventilation systems and closing all windows and doors. Sheltering-in-place might be used, for example, in the event of a chemical accident. FEMA recommends people have food, water, and medical supplies and be

prepared to stay indoors for at least three days." (**DOT**, *Catastrophic Hurricane Evacuation Plan Evaluation: Report to Congress*, June 1, 2006, p. 2-2)

Sheltering: "Taking shelter is critical in times of disaster. Sheltering is appropriate when conditions require that you seek protection in your home, place of employment, or other location where you are when disaster strikes. Sheltering outside the hazard area would include staying with friends and relatives, seeking commercial lodging, or staying in a mass care facility operated by disaster relief groups in conjunction with local authorities. To effectively shelter, you must first consider the hazard and then choose a place in your home or other building that is safe for that hazard. For example, for a tornado, a room should be selected that is in a basement or an interior room on the lowest level away from corners, windows, doors and outside walls. Because the safest locations to seek shelter vary by hazard, sheltering is discussed in the various hazard sections. These discussions include recommendations for sealing the shelter if the hazards warrant this type of protection." (**FEMA**, *Are You Ready?* May 24, 2007 update, p. 38)

Sheriff: "The Office of the Sheriff plays a distinctive role in the nation's criminal justice and homeland security system and reflects a uniquely American tradition of a law enforcement leader who is elected. Over 99% of the nation's sheriffs are elected and generally serve as the highest law enforcement officer in their respective counties." (**Kamatchus,** "Statement of… on 'Insurrection Act Rider' and State Control of the National Guard"," April 24, 2007, p. 1)

Shielding: "Any material or obstruction which absorbs (or attenuates) radiation and thus tends to protect personnel or materials from the effects of a nuclear (or atomic) explosion. A moderately thick layer of any opaque material will provide satisfactory shielding from thermal radiation, but a considerable thickness of material of high density many be needed for nuclear radiation shielding. Electrically continuous housing for a facility, area, or component, attenuates impinging electric and magnetic fields." (**Glasstone**, *The Effects of Nuclear Weapons* (3rd Ed.), 1977, Glossary, p. 639)

SHMO: State Hazard Mitigation Officer. (**FEMA**, *Call for Issues Status Report*, 2000, xxiii)

SHOC: State Health Operations Center. (Alabama, for example.)

Shock Wave: "The sudden liberation of energy causes a considerable increase of temperature and pressure, so that all the materials present are converted into hot, compressed gases. Since these gases are at very high temperatures and pressures, they expand rapidly and thus initiate a pressure wave, called a 'shock wave,' in the surrounding medium – air, water, or earth. The characteristic of a shock wave is that there is (ideally) a sudden increase of pressure at the front, with a gradual decrease behind it...." (**Glasstone**, *The Effects of Nuclear Weapons* (3rd Ed.), 1977, p. 1)

Short Term Recovery: "Short-term recovery is immediate and overlaps with response. It includes actions such as providing essential public health and safety services, restoring interrupted utility and other essential services, reestablishing transportation routes and providing food and shelter for those displaced by the disaster. Although called "short term," some of these activities may last for weeks." (**DHS,** *National Response Framework -- Federal Partner Guide* (Comment Draft), September10, 2007, p. 18) [Note: See, also, "Recovery: Short Term"]

SHSGP: State Homeland Security Grant Program, DHS.

SHSP: State Homeland Security Program. (**DHS**, *NIPP*, 2006, p. 102)

SIA: Social Impact Assessment. (**ProVention Consortium**, *CRA Toolkit: Glossary*, 2006)

SICCL: State Incident Communication Line. (**FEMA**, *IS 250*, *Emergency Support Function 15 (ESF15) External* Affairs, 2007, p. 6, Acronyms and Abbreviations)

Signals Intelligence (SIGINT): "Intelligence information derived from the interception of transmitted electronic signals." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, 39)

Significant Flood Event: A significant event is one with 1,500 or more paid losses, or occasionally one added for other reasons. (**FEMA**, *Significant Flood Events 1978 - November 30, 2007*, Jan 4, 2008 mod.)

SimCell: Simulation Cell. (**DHS**, *HSEEP Volume V: Prevention Exercises* (Draft), Dec 2005)

Simple Triage and Rapid Treatment (START): "The START system, developed by Hoag Hospital and the Newport Beach Fire Department (Newport Beach, CA), helps prepare emergency personnel to quickly organize their resources to handle multi-casualty emergencies. Using START, various agencies and individuals assume predetermined roles in managing the emergency, on-scene personnel quickly evaluate the situation and call in the appropriate extra resources and assign them specific tasks. Because of the planning and training that are the core of the START system, agencies and individuals know what they are expected to do when they arrive at the scene…. The START triage system….relies on making a rapid assessment (taking less than a minute) of every patient, determining which of four categories patients should be in [Minor, Deceased, Immediate, Delayed], and visibly identifying the categories for rescuers who will treat the patients…. If you are the initial START rescuer, you DO NOT stop to do other than the most basic intervention. If you attempt to treat every patient before completing the triage, you cannot assess the rest of the patients and identify the top priorities." (**Critical Illness and Trauma Foundation, Inc.)**

Simulation: "(1) An electronic simulation is a method for predicting the results of implementing a model over time. (2) Simulation of non-participating personnel and agencies is a technique for increasing realism in exercises. (**FEMA**, *Homeland Security Exercise and Evaluation Program Glossary*, 2008)

Simulation Cell: "The SimCell is an exercise area where *controllers* generate and deliver *injects*, and receive player responses to non-participating organizations, agencies, and individuals who would likely participate actively in an actual incident. Physically, the SimCell is a working location for a number of qualified professionals who portray representatives of non-participating organizations, agencies, and individuals who would likely participate during an actual incident." (**FEMA**, *Homeland Security Exercise and Evaluation Program Glossary*, 2008)

Simulation Exercise: "Test performed under conditions as close as practicable to real world conditions." (**ISO 22399**, *Societal Security*…, 2007, 7)

Simulation Exercise: "Decision making exercise and disaster drills within threatened communities in order to represent disaster situations to promote more effective coordination of response from relevant authorities and the population." (**UNDHA**, *DM Glossary*, 1992, 68)

Simulators: "Simulators are control staff personnel who role-play as non-participating organizations or individuals. They most often operate out of the *SimCell*, but may occasionally have face-to-face contact with players. Simulators function semi-independently under the supervision of SimCell *controllers*, enacting roles (e.g., as media reporters or next-of-kin) in accordance with instructions provided in the *MSEL*. All simulators are ultimately accountable to the exercise director and *senior controller*." (**FEMA**, *Homeland Security Exercise and Evaluation Program Glossary*, 2008)

Single Point of Contact (SPOC): "Executive Order 12372 requires applicants from State and local units of government or other organizations providing services within a State to submit a copy of the application to the State SPOC, if one exists, and if this program has been selected for review by the State. Applicants must contact their State SPOC to determine if the program has been selected for State review. (**DHS**, *Fiscal Year 2008 Buffer Zone Protection Program Guidance and Application Kit*, February 2008, p. 16)

Single Resource: "An individual, a piece of equipment and its associated personnel, or a crew or a team of individuals with an identified work supervisor that can be used at an incident." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 57)

SIOC: Strategic Information and Operations Center, FBI. (**DHS**, *NRF*, 2008, 57)

SIOP: Single Integrated Operational Plan.

SIR: Serious Incident Report. (**Dept. of the Army**, *WMD-CST Operations*, Dec. 2007, p. G-6)

Site Assistance Visit (SAV): "The Site Assistance Visit (SAV) program is another long-running DHS program that has had a measurable impact on the Commercial Facilities Sector, particularly those sites that would be considered places of mass gathering. SAVs identify vulnerabilities, leading to a dialogue betweewn DHS and the facility owners/operators and local authorities concerning means of migigating identified vulnerabilities. As of May 2008, there have been 246 SAVs performed at various commercial facilities across the Nation." (**DHS**, *Statement for the Record, Robert B. Stephan, Assistant Secretary, Infrastructure Protection, National Protection and Programs Directorate…[DHS] before the Committee on…[HLS]*, July 9, 2008, p. 4)

SitMan: Situation Manual. (**FEMA**, IS 120.A, *An Introduction to Exercises*, 2 Feb 2008, p. 34)

SitRep: Situation Report. (**DA**, *WMD-CST Operations*, December 2007, Glossary-6)

Situation Assessment: "Definition: Manage, monitor, evaluate, and anticipate specific threat information in a dynamic incident environment, and communicate contingencies so that appropriate protective operations can be conducted." (**DHS**, *UTL 2.1*, 2005, p. 44)

Situation Assessment: "The evaluation and interpretation of information gathered from a variety of sources (including weather information and forecasts, computerized models, GIS data mapping, remote sensing sources, ground surveys, etc.) that, when communicated to emergency managers and decision makers, can provide a basis for incident management decision making." (**USCG**, *IM Handbook*, 2006, Glossary 25-22/23)

Situation Awareness: "…situation awareness (SA), an internal conceptualization of the current situation, becomes the driving factor in the decision-making process. For novices as well, who may operate using very different decision strategies, understanding the situation frequently poses the major portion of their task. In most settings effective decision making largely depends on having a good understanding of the situation at hand…. Many human errors that are attributed to poor decision making actually involve problems with the SA portion of the decision-making process as opposed to the choice of action portion of the process. Decision makers make the correct decision for their perception of the situation, but that perception is in error. This represents a fundamentally different category of problem than a decision error in which the correct situation is comprehended by a poor decision is made as to the best course of action, and indicates very different types of remediation strategies." (**Endsley**, "The Role of Situation Awareness in Naturalistic Decision Making," 1997, pp. 269-270)

"Concurrent with the growing interest in NDM [Naturalistic Decision Making], situation awareness has developed as a research focus in the past 10 years, largely in the aviation environment, but more recently in many other domains, including the nuclear power industry, automobile driving, air traffic control, medical systems, teleoperations, maintenance, and advanced manufacturing systems. Situation awareness is formally defined as 'the perception of the elements in the environment within a volume to time and space, the comprehension of their meaning and the projection of their status in the near future' (Endsley, 1988, p. 97). Situation awareness therefore involves perceiving critical factors in the environment (level 1 SA); understanding what those factors mean, particularly when integrated together in relation to the person's goals (level 2); and at the highest level, an understanding of what will happen with the system in the near future (Level 3). These higher levels of SA allow decision makers to function in a timely and effective manner." (**Endsley**, "The Role of Situation Awareness in Naturalistic Decision Making," 1997, p. 270)

[Note: See, also, Naturalistic Decision Making.]

Situation Awareness: "The process of evaluating the severity and consequences of an incident and communicating the results." (**NFPA 1600**, 2007, p. 8) [See Situational Awareness]

Situation Board: "Large sheets of paper or white boards that are affixed to walls visible to those working an intelligence/investigations operation. These boards give individuals immediate access to crucial information regarding the incident at hand. They also provide other crisis management team members a commanding view of information as it is processed." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, 40)

Situation Manual (SitMan): "A Situation Manual (SitMan*)* is a participant handbook for discussion-based exercises, particularly TTXs. It provides background information on exercise scope, schedule, and objectives. It also presents the scenario narrative that will drive participant discussions during the exercise." (**FEMA**, *About HSEEP*, 2008)

Situation Report: "Often contain confirmed or verified information regarding the specific details relating to the incident." (**FEMA**, *NIMS* (FEMA 501/Draft), August 2007, p. 157)

Situation Report: "Producing the SITREP is an "emergency coordination" activity…" (**Trainor**, *Searching For a System: Multi-Organizational Coordination in the September 11th World Trade Center Search and Rescue Response,* 2004, p. 24)

Situation Unit (ICS): "A unit within the Planning Section responsible for the collection, organization and analysis of incident status information and for analyzing the situation as it progresses." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 58)

Situational Awareness: "Situational awareness requires continuous monitoring of relevant sources of information regarding actual and developing incidents. The scope and type of monitoring vary based on the type of incidents being evaluated and needed reporting thresholds. Critical information is passed through established reporting channels according to established security protocols. Priorities include:
• *Providing the right information at the right time.* For an effective national response, jurisdictions must continuously refine their ability to assess the situation as an incident unfolds and rapidly provide accurate and accessible information to decisionmakers in a user-friendly manner. It is essential that all levels of government, the private sector (in particular, owners/operators of critical infrastructure and key resources (CIKR)), and NGOs share information to develop a common operating picture and synchronize their response operations and resources.

• *Improving and integrating national reporting.* Situational awareness must start at the incident scene and be effectively communicated to local, tribal, State, and Federal governments and the private sector, to include CIKR. Jurisdictions must integrate existing reporting systems to develop an information and knowledge management system that fulfills national information requirements.

• *Linking operations centers and tapping subject-matter experts.* Local governments, tribes, States, and the Federal Government have a wide range of operations centers that monitor events and provide situational awareness. Based on their roles and responsibilities, operations centers should identify information requirements, establish reporting thresholds, and be familiar with the expectations of decisionmakers and partners. Situational awareness is greatly improved when experienced technical specialists identify critical elements of information and use them to form a common operating picture.

"Reporting and documentation procedures should be standardized to enhance situational awareness and provide emergency management and response personnel with ready access to

critical information. Situation reports should contain verified information and explicit details (who, what, where, when, and how) related to the incident. Status reports, which may be contained in situation reports, relay specific information about resources. Based on an analysis of the threats, jurisdictions issue accessible warnings to the public and provide emergency public information." (**DHS**, *National Response Framework*, Jan 2008, 32-33)

Situational Awareness: "In this section, the term 'situational awareness' means information gathered from a variety of sources that, when communicated to emergency managers and decision makers, can form the basis for incident management decisionmaking." (**Post-Katrina Emergency Management Reform Act of 2006,** p. 1409)

Situational Awareness: "Maintaining situational awareness is essential to assessing emerging incidents as well as conducting operations and ultimately ensuring the effective management of incident response. It demands that we prioritize information and develop a common operating picture, both of which require a well-developed national information management system and effective multi-agency coordination centers to support decision-making during incidents." (**White House**, *National Strategy for Homeland Security*, HSC, October 2007, p. 34)

Situational Awareness: "The maintenance of situational awareness through timely and accurate information is a fifth core principle integral to incident management. It requires continuous sharing, monitoring, verification, and synthesis of information to support informed decisions on how to best manage threats, potential threats, disasters, or events of concern." (**White House**, *National Strategy for Homeland Security*, HSC, October 2007, p. 47)

SLATT: State and Local Anti-Terrorism Training.

SLBM: Sub or Sea Launched Ballistic Missile. (**OCD**, *Abbreviations*, 1971, p. 4)

SLG: Senior Leadership Group. (**DHS**, *DHS Operations Coordination: IM&P: CAP*, 2008)

SLGCP: Office of State and Local Government Coordination and Preparedness, OJP/USDOJ; moved to DHS upon its creation, then to FEMA Preparedness Directorate in 2007 when Preparedness responsibilities were reintegrated back into FEFA pursuant to Post Katrina Emergency Management Reform Act.

SLOSH Model: Sea, Lake, and Overland Surges from Hurricanes Model.

SLTGCC: State, Local, and Tribal Government Cross-Sector Council. (**DHS**, *NIPP*, 2006, p. 5)

SM: Shelter Manager/Management. (**DCPA**, *On-Site Assistance Appendices*, 1974, p. B.9)

SM: Student Manual (FEMA Emergency Management Institute).

Smallpox: "Smallpox is a serious, contagious, and sometimes fatal infectious disease. There is no specific treatment for smallpox disease, and the only prevention is vaccination. The *pox* part of *smallpox* is derived from the Latin word for "spotted" and refers to the raised bumps that

appear on the face and body of an infected person. There are two clinical forms of smallpox. Variola major is the severe and most common form of smallpox, with a more extensive rash and higher fever. There are four types of Variola major smallpox: ordinary (the most frequent type, accounting for 90% or more of cases); modified (mild and occurring in previously vaccinated persons); flat; and hemorrhagic (both rare and very severe). Historically, Variola major has an overall fatality rate of about 30%; however, flat and hemorrhagic smallpox usually are fatal. Variola minor is a less common presentation of smallpox, and a much less severe disease, with death rates historically of 1% or less. Smallpox outbreaks have occurred from time to time for thousands of years, but the disease is now eradicated after a successful worldwide vaccination program. The last case of smallpox in the United States was in 1949. The last naturally occurring case in the world was in Somalia in 1977. After the disease was eliminated from the world, routine vaccination against smallpox among the general public was stopped because it was no longer necessary for prevention." (**CDC**, *Smallpox Disease Overview*, 30Dec04 modification)

SMART: Simple, Measurable, Achievable, Realistic, Task-oriented. (**FEMA**, IS 120.A, An Introduction to Exercises, 2Feb2008, p. 37)

SMD: State Management of Disasters Initiative. (**FEMA**, *Public Assistance Program*, 2007)

SME: Small and Medium Enterprise. (**ISO 22399**, *Societal Security*…, 2007, p. v)

SME: Subject Matter Expert. (**DA**, *WMD-CST Operations*, December 2007, Glossary-6)

SNL: Sandia National Laboratories.

SNM: Special Nuclear Material. (**August, Jr**., *Technology-Independent Metrics*…, Jan 2008)

SNP: Special Needs Planning.

SNS: Strategic National Stockpile (CDC, HHS). (**HSGAC**, A *Nation Unprepared*, 2006, 634)

SO: Safety Officer, ICS. (**DHS,** *NIMS*, 2004, p. 13)

Social and Institutional Network Analysis: "Social and Institutional network analysis enables the identification of organisations, their role/importance and people's perceptions of them. It also identifies individuals, groups and organisations that play a role in disaster response and that can support the community." (**ProVention Consortium**, *CRA Toolkit: Glossary of Terms*, 2006)

Social Capital: "consists of the stock of active connections among people: the trust, mutual understanding, and shared values and behaviors that bind the members of human networks and communities and make cooperative action possible."[118] (**DHS**, *The ODP Guidelines*, 2003, 31)

[118] Cites: Cohen, D. and Prusak, L. (2001) *In Good Company. How social capital makes organizations work*, Boston, Ma.: Harvard Business School Press. P. 4.

Social Distancing (Pandemic): "Within the workplace, social distancing measures could take the form of: modifying the frequency and type of face-to-face employee encounters (e.g., placing moratoriums on hand-shaking, substituting teleconferences for face-to-face meetings, staggering breaks, posting infection control guidelines); establishing flexible work hours or worksite, (e.g., telecommuting); promoting social distancing between employees and customers to maintain three-feet spatial separation between individuals; and implementing strategies that request and enable employees with influenza to stay home at the first sign of symptoms." (**DHS**, *Pandemic Influenza -- Preparedness, Response, and Recovery: Guide for CIKR*, 2006, p. 14)

Social Impact Assessment (SIA): "SIA is a method used for examining social change due to external sources, especially specific development projects, but also government policies, technological change, and social processes - anything that has a social impact." (**ProVention Consortium**, *CRA Toolkit: Glossary of Terms*, 2006)

Social Survey: "A survey to provide information to establish the context in which the risk assessment will take place and the criteria against which risk will be evaluated. Decisions concerning whether risk treatment is required may also be based on operational, technical, financial, legal, environmental, humanitarian or other criteria for which additional surveys will be required." (**UNDAP**, *Techniques Used in Disaster Risk Assessment*, 2008)

Soft Story: "A building story that has significantly less stiffness than the story above. Some buildings with parking at ground level (and thus fewer walls or columns) or an otherwise open ground story have this condition. The term is sometimes also applied to a story that has less strength than the one above, a condition that is more precisely termed a 'weak story'." (**USGS**, *Putting Down Roots in Earthquake Country*, 2007, Glossary)

SOG: Standard Operating Guidelines. (**Florida Division of Emergency Management**, 2003)

SOLIC: Special Operations & Low Intensity Conflict, DOD. (**GAO**, *Maritime Security*, Dec. 2007)

Soman: "Soman is a human-made chemical warfare agent classified as a nerve agent. Nerve agents are the most toxic and rapidly acting of the known chemical warfare agents. They are similar to pesticides (insect killers) called organophosphates in terms of how they work and the kinds of harmful effects they cause. However, nerve agents are much more potent than organophosphate pesticides. Soman was originally developed as an insecticide in Germany in 1944. Soman is also known as "GD." Soman is a clear, colorless, tasteless liquid with a slight camphor odor (for example, Vicks Vapo-Rub®) or rotting fruit odor. It can become a vapor if heated." (**CDC**, *Facts About Soman*, March 7, 2003 Update)

SONS: Spill of National Significance. (**Spill of National Significance Website**, *SONS FAQs*, 2007, p. 1)

SOP: Standing Operating Instructions. (**DA**, *WMD-CST Operations*, Dec. 2007, Glossary-6)

SOP: Standard Operating Procedures. (**DCPA**, *On-Site Assistance Appendices*, 1974, p. B-10)

SOSINK: Southwestern Ohio, Southeastern Indiana, Northern Kentucky. (**DHS/OGT**, 2006, 21)

Source: "Item or activity having a potential for a consequence. Note: In the context of safety, source is a hazard." (**ISO 22399**, *Societal Security*…, 2007, 7)

South Carolina Wind and Hail Underwriting Association: "The South Carolina General Assembly authorized the creation of the South Carolina Wind and Hail Underwriting Association (South Carolina Windpool) in 1971. All admitted property and casualty companies licensed by the South Carolina Department of Insurance are members of and are required to participate in the South Carolina Windpool. The Windpool provides wind and hail coverage in the coastal areas of the state, which are specifically designated by statute." (**GAO**, *Natural Disasters: Public Policy Options.*…, Nov 2007, p. 72)

Southeast Region Research Initiative (SERRI): "SERRI is a groundbreaking program managed by Oak Ridge National Laboratory (ORNL) for the US Department of Homeland Security to assist local, state and tribal leaders in developing the tools and methods required to anticipate and forestall terrorist events and to enhance disaster response. Combining science and technology with validated operational approaches, SERRI will address regionally unique requirements and suggest regional solutions with potential national implications. (**ORNL**, *SERRI*, 2008)

"SERRI will be a national resource for developing a full spectrum of competencies and technological capabilities for community and regional resilience and for enhancing resilience efforts in the Southeast Region." (ORNL, *SERRI) Community and Regional Resilience Initiative: Resilient Communities, Resilient Regions* (Slide Pres.), 13Aug07, slide 2)

Southern Regional Emergency Management Compact (SREMAC): "Many questions were raised about the capability of the federal and non-federal governments to manage the consequences of disasters after Hurricane Andrew destroyed much of the infrastructure in areas around Miami, Florida. Then-Florida Governor Lawton Chiles initiated discussions with other governors through the Southern Governors Association to develop a mutual aid agreement. These discussions concluded with agreement by 17 states, as well as the U.S. Virgin Islands and Puerto Rico, to adopt the *Southern Regional Emergency Management Compact* (SREMAC) in 1993." (**CRS**, *The EMAC*, 2008, p. 6)

Southwestern Ohio, Southeastern Indiana, Northern Kentucky (SOSINK) Expanded Regional Collaboration: "The purpose…is to strengthen regional and interstate relationships by providing new linkages among Southwestern Ohio-Southeastern Indiana-Northern Kentucky (SOSINK) regional partners to achieve six critical outcomes, which are: to create a Regional Emergency Operations Plan (REOP). This will facilitate partners working off identical plans and enhance efforts for the National Infrastructure Protection Plan (NIPP) implementation; to ensure mutual aid compacts are multidisciplinary and multi-jurisdictional (both intrastate and interstate); to link Emergency Operation Centers (EOCs), via electronic/web-based systems, ensuring real time access to threat and resource availability information.

"This will allow the 'common picture' of an incident to be regionally shared; to establish regional participation in the design, production and evaluation of training programs and exercises, ensuring a regional approach to response coordination; to ensure regional collaboration and coordination by holding multi-jurisdictional quarterly meetings to oversee implementation of investments and other priorities; and to collaborate with other Ohio UASI regions." (**DHS/OGT**, *Expanded Regional Collaboration…FY 2004-2006*, 2006, p. 21)

SOW: Statement of Work.

SOW: Switch on Wheels.

SPA: Standard Project Hurricane, USACE. (**HSGAC**, A *Nation Still Unprepared*, 2006, 634)

Span of Control: Span of control is key to effective and efficient incident management. Within ICS, the span of control of any individual with incident management supervisory responsibility should range from three to seven subordinates. The type of incident, nature of the task, hazards and safety factors, and distances between personnel and resources all influence span-of-control considerations." (**DHS**, *NIMS*, 2004, p. 10)

Span of Control: "The number of resources for which a supervisor is responsible, usually expressed as the ratio of supervisors to individuals. (Under NIMS, an appropriate span of control is between 1:3 and 1:7, with optimal being 1:5.)." (**FEMA**, *NIMS Draft*) August 2007, p. 158)

Span of Control [ICS/NIMS]: "A Command and Control term that means how many organizational elements may be directly managed by one person. Span of Control may vary from one to seven, and a ratio of five reporting elements is optimum." (**USCG**, *IM Handbook*, 2006, Glossary 25-23)

Special Event Assessment Rating (SEAR): "In order to ensure the Special Event Data Call properly conducts a preliminary assessment of events, the DHS SEWG has developed a questionnaire for individuals at the state and local level who are users of the system and entering their special event data. Once the data call is closed, the events are run through the risk methodology program, which analyzes response criteria captured by the questionnaire and assesses stages of threat, consequences and vulnerabilities for the event. This results in preliminary Special Event Assessment Rating (SEAR) level results, which are categorized as SEAR Levels 1-5." (**DHS**, *Statement of Rufe*, July 9, 2008, pp. 2-3)

"An event is considered to be a **SEAR Level 1** when it is an event of significant national and/or international importance that may require extensive Federal interagency security and incident management preparedness. Pre-deployment of Federal assets as well as consultation, technical advice and support to specific functional areas in which the state and local agencies may lack expertise or key resources may also be warranted. In order to ensure unified Federal support to the local authorities and appropriate national situational awareness, a Federal Coordinator (FC) will be designated, and an Integrated Federal Support Plan (IFSP) will be developed.

A **SEAR Level 2** event is a significant event with national and/or international importance that may require direct national-level Federal support and situational awareness. The magnitude and

significance of these events calls for close coordination between Federal, state, and local authorities and may warrant limited pre-deployment of USG assets as well as consultation, technical advice and support to specific functional areas in which the state and local agencies may lack expertise or key resources. In order to ensure unified Federal support to the local authorities and appropriate national situational awareness, a Federal Coordinator (FC) will be designated and an Integrated Federal Support Plan (IFSP) will be developed.

On the other hand, **SEAR Level 3, 4 and 5** events do not have a FC identified nor an IFSP generated, however, State and local officials may still solicit resources from Federal agencies at the agencies' expense.

Regardless of the SEAR Level designation assigned, the Federal government can remain involved with the special event. DHS will maintain awareness of all special events through reporting produced by the National Operations Center (NOC). In addition, State and local planners may request support for their events from the Federal Departments and Agencies located near the event." (**DHS**, *Statement of Rufe*, July 9, 2008, p. 3)

Special Event Data Call: "This automated system, allows Special Event planners from States, cities and localities to enter information regarding upcoming special events into a data base. The most recent Data Call which covers Calendar Year 2008 had over 4,000 events entered primarily by State and/or local Planners. This list is the crucial starting point and is the only method that provides DHS and the SEWG with situational awareness." (**DHS**, *Statement of Rufe*, July 9, 2008, p. 2)

Special Events for Homeland Security (SEHS): "Those special events designated as having an impact on homeland security." (**JCS/DoD**, *Civil Support*, 2007, p. GL-11) [Note: Replaced by the Special Event Assessment Report. (**DHS**, *Office of Operations Coordination, Interagency Planning Workshop*, November 29, 2007, slide # 26)

Special Event Homeland Security (SEHS) Levels: "Managed by the Department of Homeland Security, the Interagency Special Events Working Group **(**SEWG) is the core of an interagency process that involves various agencies of the Federal government. Within the Special Events Working Group (SEWG), Federal departments and agencies provide input and recommendations concerning Special Events based on their respective authorities, responsibilities, and fields of expertise. The SEWG is co-chaired by designees from DHS Headquarters, the U.S. Secret Service, FEMA, and the FBI, and is currently composed of representatives from over 40 Federal departments and agencies that have responsibilities and/or association with Special Events security and incident management. The SEWG develops the *Prioritized List of Special Events*, recommends Special Event Homeland Security (SEHS) Levels, and is the single forum that ensures comprehensive and coordinated Federal interagency awareness of and support to designated Special Events.

"The *Prioritized List of Special Events* is the single interagency resource delineating domestic events, activities, or meetings that do not rise to the level of a National Security Special Event (NSSE), but which nevertheless are significant. Using a risk-based approach to weigh vulnerabilities and consequences against threats, the SEWG develops the *Prioritized List of*

Special Events from event recommendations submitted by each state, territory and the District of Columbia. The events are categorized into one of the four SEHS levels using objective criteria including but not limited to: size; threat; symbolic or political significance; duration; location; number and type of attendees; media coverage; dignitary participation; proximity of critical infrastructure; and state and local capabilities. Federal support is scaled according to the SEHS level. SEHS-IV only requires maintaining Federal situational awareness of the event while a wide variety of Federal prevention, protection, and response resources may be provided for SEHS-I events. Events that do not reach the threshold of SEHS-IV are not included on the list. Each SEHS level is defined as:

> 1. SEHS-I: An event of large magnitude and significant national and/or international importance requiring significant Federal support and situational awareness. This designation requires the appointment of a Federal Coordinator and the development of an Integrated Federal Support Plan.
>
> 2. SEHS-II: An event of medium magnitude and average national and/or international importance requiring Federal support and situational awareness. This designation also requires the appointment of a Federal Coordinator and the development of an Integrated Federal Support Plan.
>
> 3. SEHS-III: An event of low magnitude and low national and/or international importance requiring limited Federal support and situational awareness. Monitoring and Federal coordination for support are accomplished through the Homeland Security Operations Center (HSOC) and the SEWG.
>
> 4. SEHS-IV: An event that requires Federal awareness but does not warrant direct Federal support or involvement. DHS may assist state and local jurisdictions by providing training and exercise opportunities through existing and/or tailored programs. The HSOC will maintain awareness of the event." (**MO SEMA** (Department of Public Security), *Missouri Hazard Analysis, Annex Q: Special Events Considerations*, October 2006, p. Q-7). [Note: Replaced by Special Event Assessment Report events. (**DHS**, Office of Operations Coordination, *Interagency Planning Workshop*, November 29, 2007, slide #26).]

Special Event Working Group (SEWG): "The Special Event Working Group (SEWG) is a group of representatives of various federal entities who may be involved in planning for or coordinating federal activities for a special event. To paraphrase, a special event is defined as a function that draws a large public crowd to the host city or venue in combination with political importance and local, regional or international significance. The SEWG was formed in April 2004, to validate a methodology for identifying and categorizing special events (other than those designated as National Special Security Events (NSSE)), and coordinating Federal support to those events.

The mission and purpose of the SEWG is to support a unified interagency planning and coordination effort for Special Events and to ensure coordination of Federal support to the designated event. The SEWG identifies events that may require a coordinated Federal response

and collectively coordinates Federal assets to bridge any capability gaps identified by state and local partners that have not already been addressed by exhausting local mutual assistance agreements….

The SEWG consists of several elements: (1) the five Co-chairs of the SEWG who consist of senior or executive level (GS-15/SES) managers from OPS, the Federal Emergency Management Agency (FEMA), the Federal Bureau of Investigation (FBI), the United States Secret Service (USSS) and DHS Office of Risk Management & Analysis (RMA), (2) the SEWG General Membership itself, and (3) the DHS programmatic, coordination and administrative staff dedicated to SEWG which is housed in OPS.

The membership of the SEWG consists of representatives designated by their respective Federal Departments, Agencies and/or Components. These representatives are traditional federal agencies with missions that are related to Special Events planning, coordination, and execution, and span the four pillars of the National Response Framework: Prevention, Protection, Response and Recovery. Presently, there are upwards of fifty Federal Departments/Agencies and their Components with representatives assigned to the SEWG…" (**DHS**, *Statement of Roger Rufe*, July 9, 2008, pp. 1-2)

Special Flood Hazard Area: "Land in the floodplain within a community subject to one percent or greater chance of flooding in any given year." (**APA**, 2005, p. 84)

Special Flood Hazard Area (SFHA): "SFHA is the…A and V Zones as depicted on the Flood Insurance Rate Map. B, C, and X Zones are outside of the SFHA." (**FEMA**, *Reducing Damage from Localized Flooding – A Guide for Communities*, 2005, viii)

Special Flood Hazard Area (SFHA), NFIP: "The land area covered by the floodwaters of the base flood is the Special Flood Hazard Area (SFHA) on NFIP maps. The SFHA is the area where the NFIP's floodplain management regulations must be enforced and the area where the mandatory purchase of flood insurance applies. The SFHA includes Zones A, AO, AH, A1-30, AE, A99, AR, AR/A1-30, AR/AE, AR/AO, AR/AH, AR/A, VO, V1-30, VE, and V." (**FEMA**, *SFHA*, 2007)

Special Needs Population: "Pertaining to a population whose members may have additional needs before, during, and after an incident in one or more of the following functional areas: maintaining independence, communication, transportation, supervision, and medical care. Individuals in need of additional response assistance may include those who have disabilities; who live in institutionalized settings; who are elderly; who are children; who are from diverse cultures, who have limited English proficiency, or who are non-English speaking; or who are transportation disadvantaged." (**FEMA**, *NIMS* (FEMA 501/Draft), August 2007, p. 158)

Special Needs Population Team (FEMA): "FEMA's Special Needs Population Team works with ESF- 6 partners, OFAs and the private sector to support Regional and JFO initiatives when providing services to special needs populations. This team provides support to facilitate the integration of services at the Regional and JFO levels to ensure that mass care and emergency assistance services are in compliance with Federal, State and local requirements, regulations and

laws." (**FEMA**, *Statement of R. David Paulison, Hearing on: "Nuclear Terrorism: Providing Medical Care and Meeting Basic Needs in the Aftermath – the Federal Response," 26* Jun08, 13)

Special Needs Populations, Evacuation Purposes: "People with special needs are defined by the Governor [TX] as those who are not capable of evacuating themselves. As the modes of transportation needed to evacuate these populations vary, the Task Force further classified the special needs populations into four main categories:
– Hospital Patients
– Nursing Home Patients
– Home Healthcare Clients, including Halfway Houses
– Economically Unable to Evacuate, otherwise unable to self-evacuate, including elderly (not but infirmed), homeless, mentally impaired, chronic substance abusers, international visitors, and those without access to their own vehicle or otherwise financially unable to evacuate." (**Houston-Galveston Area Evacuation and Response Task Force**. *Recommendations Report*. 2006, p. 12)

Special Needs Shelters: "Special needs shelters are distinct shelters or portions of general shelters that are designed to care for people with special needs, including assistance with maintaining the activities of daily living and monitoring minor health and medical conditions. The intent of special needs shelters is to provide an environment in which the health of shelterees with special needs can be sustained with available resources. Medical eligibility for a special needs shelter is based on a leveling system, which accounts for the individual's condition and the skills required to provide care. (**New England Center for Emergency Preparedness**, *Community Planning Guide*, 2007, p. 42)

Special Nuclear Material (SNM): "According to the Nuclear Regulatory Commission, special nuclear material is plutonium, uranium-233, or uranium enriched in the isotopes uranium-233 or uranium-235." (**DHS/OIG**, *DNDO Progress*…, Dec 2007, p. 8)

Special Population: "A targeted group in a disaster-impacted community or area with needs that require specific attention by the crisis counseling program. Special populations include children, adolescents, older adults, elderly persons, members of ethnic and cultural groups, migrant workers, disaster relief workers, persons who are severely mentally ill, persons with disabilities, and homeless persons. Other special populations may be unique to the area being served by the crisis counseling program." (**HHS**, 2003, p. 62)

SPF: Standard Project Flood. (**Galloway**, *A California Challenge*, 2007, v)

Spill of National Significance: "The Oil Pollution Act 90 (OPA 90) was drafted in response to the catastrophic oil spill in Valdez, AK with the intent of improving readiness for the threat of future oil spills. The law required the National Oil and Hazardous Substance Pollution Contingency Plan, also known as the National Contingency Plan (NCP), to be amended to include a section that addressed a Spill of National Significance (SONS). A SONS is defined as: "a spill that, due to its severity, size, location, actual or potential impact on the public health and welfare or the environment, or the necessary response effort, is so complex that it requires extraordinary coordination of federal, state, local, and responsible party resources to contain and

clean up the discharge" (40 CFR 300.5)." (**Spill of National Significance Website**, *SONS FAQs*, December 14, 2007 Update, p. 1)

SPIREP: Spot Intelligence Report. (**DA**, *WMD-CST Operations*, December 2007, Glossary-6)

SPOC: Single Point of Contact. (**DHS**, *Fiscal Year 2008 Buffer Zone Protection Program Guidance and Application Kit*, February 2008, p. 16)

Spontaneous Evacuation: "Residents or citizens in the threatened areas observe an emergency event or receive unofficial word of an actual or perceived threat and without receiving instructions to do so, elect to evacuate the area. Their movement, means, and direction of travel is unorganized and unsupervised." (**FEMA**, *Guide For All-Hazard Emergency Operations Planning* (State and Local Guide (SLG) 101), September 1996, p. GLO-5)

Spontaneous Volunteers: (See, "Volunteers, Spontaneous")

SPOR: Secure Policy-oriented Object Router. (**FEMA**, *IPAWS Update*, 2007, slide 29)

SPOT Report: "A concise narrative report of essential information covering events or conditions that may have an immediate and significant effect on current planning and operations that is afforded the most expeditious means of transmission consistent with requisite security." (DOD)

SPP: Security and Prosperity Partnership of North America. (**DHS**, *NIPP*, 2006, p. 102)

SREMAC: Southern Regional Emergency Management Compact, 1993.

SSA: State Administrative Agency. (FEMA, TEI/TO Course Catalog, 2008, 6)

SSAs: Sector-Specific Agencies, National Infrastructure Protection Plan. See following reference for examples. (**DHS**, *NIPP,* 2006, p. 3)

SSHS: Safir/Simson Hurricane Scale. (Blake, Rappaport, Landsea, 2007, 3)

SSP: Sector-Specific Plan, National Infrastructure Protection Program. (**DHS**, *NIPP*, 2006, p. 102)

SSI: Sensitive Security Information.

S&T: Science and Technology Directorate, DHS.

Stafford Act [See, also, Robert T. Stafford Disaster Relief and Emergency Assistance Act]

Stafford Act: 1) The Robert T. Stafford Disaster Relief and Emergency Assistance Act, Public Law 93-288, as amended. 2) The Stafford Act provides an orderly and continuing means of assistance by the Federal Government to State and local governments in carrying out their responsibilities to alleviate the suffering and damage which result from disaster. The President, in response to a State Governor's request, may declare and "emergency" or "major disaster" in order to provide Federal assistance under the Act. The President, in Executive Order 12148, delegated all functions, except those in Sections 301, 401, and 409, to the Director, of FEMA. The Act provides for the appointment of a Federal Coordinating Officer who will operate in the designated area with a State Coordinating Officer for the purpose of coordinating state and local disaster assistance efforts with those of the Federal Government. (**44 CFR 206.2**)

Stafford Act: "Federal support to State and local jurisdictions takes many forms. The most widely known authority under which assistance is provided for major incidents is the Stafford Act. When it is clear that State or tribal capabilities will be exceeded or may be exhausted, the Governor can request Federal assistance under the Stafford Act. The Stafford Act authorizes the President to provide financial and other forms of assistance to State and local governments, certain private nonprofit organizations and individuals to support response, recovery and mitigation efforts following Presidentially-declared major disasters and emergencies. Most incidents are not of sufficient magnitude to merit a Presidential emergency or major disaster declaration. However, when State and local resources are insufficient, a Governor may ask the President to declare a Federal disaster or emergency. Before making a declaration request, the Governor normally must activate the State's emergency plan and ensure that all appropriate State and local actions have been taken, including:

Surveying the affected areas to determine the extent of private and public damage.

Conducting joint Preliminary Damage Assessments with DHS/FEMA officials to estimate the types and extent of Federal disaster assistance required.

Only the Governor can initiate a request for a Presidential emergency or major disaster declaration. This request is made through the DHS/FEMA Regional Administrator and is based on a finding that Federal assistance is needed because the situation exceeds State and local response capabilities due to its severity and magnitude. The request includes:

Information on the extent and nature of State resources that have been or will be used to address the consequences of the disaster.

A certification by the Governor that State and local governments will assume all applicable non-Federal costs required by the Stafford Act.

An estimate of the types and amounts of supplementary Federal assistance required.

Designation of the State Coordinating Officer.

The Governor addresses the request to the President and forwards it to the DHS/FEMA Regional Administrator, who makes a recommendation to the DHS/FEMA Administrator. The DHS/FEMA Administrator then recommends a course of action to the President. The Governor, appropriate members of Congress and Federal agencies are immediately notified of a Presidential declaration. Federal support to States under the Stafford Act is coordinated by DHS." (**DHS**, *NRF -- Federal Partner Guide* (Comment Draft), September 10, 2007, p. 19)

Stafford Act: "Stafford Act Authorities… The Stafford Act describes the programs and processes by which the Federal Government provides disaster and emergency assistance to State and local governments, Tribal nations, eligible private nonprofit organizations, and individuals affected by a declared major disaster or emergency. The Stafford Act provides for a Presidential declaration of a major disaster or emergency after a Governor's request for assistance if:

- an event is beyond the combined response capabilities of the State and affected local governments; and
- based on joint Federal-State-local assessments, the damages are of sufficient severity and magnitude to warrant assistance under the Stafford Act.

In a particularly rapidly developing or clearly devastating disaster, there may be an expedited declaration.

Further, the President may issue an emergency declaration under the Stafford Act to provide direct emergency assistance without a Governor's request if an incident involves a subject matter that is exclusively or preeminently the responsibility of the United States Government. In such a case, the President will consult the Governor of the affected State, if practicable. Also, after a Presidential declaration has occurred, FEMA may provide accelerated Federal assistance and support where necessary to save lives, prevent human suffering, or mitigate severe damage, even in the absence of a specific request for particular resources or assistance from the Governor. In such cases, the Governor of the affected State will be consulted if practicable, but this consultation will not delay or impede the provision of such accelerated Federal assistance. Prior to a major disaster or emergency declaration, the Stafford Act authorizes FEMA to improve the timeliness of its response by pre-deploying personnel (who may be from any number of Federal agencies) and equipment to reduce immediate threats to life, property, and public health and safety." (**FEMA**, Statement of Paulison, *Hearing on: "Nuclear Terrorism: Providing Medical Care and Meeting Basic Needs in the Aftermath – the Federal Response,"* June 26, 2008, p. 4)

Stafford Act Congressional Intent: "It is the intent of the Congress, by this Act, to provide an orderly and continuing means of assistance by the Federal Government to State and local governments in carrying out their responsibilities to alleviate the suffering and damage which result from such disasters by -
(1) revising and broadening the scope of existing disaster relief programs;
(2) encouraging the development of comprehensive disaster preparedness and assistance plans, programs, capabilities, and organizations by the States and by local governments;
(3) achieving greater coordination and responsiveness of disaster preparedness and relief programs;
(4) encouraging individuals, States, and local governments to protect themselves by obtaining insurance coverage to supplement or replace governmental assistance;

(5) encouraging hazard mitigation measures to reduce losses from disasters, including development of land use and construction regulations; and
(6) providing Federal assistance programs for both public and private losses sustained in disasters. (**FEMA**, *Robert T. Stafford Disaster…Act…*, June 2007, p. 13)

Stafford Act, Post Katrina Emergency Management Reform Act of 2007 Modifications:
"Subtitle E improves existing disaster relief authorities by providing the President additional program flexibility, financial incentives to control costs, and by addressing unique aspects of catastrophic disasters. The subtitle maintains the primacy of state governments and the supporting role of federal assistance under the Stafford Act. The changes:

- Allow for accelerated federal assistance and federal support to save lives, prevent human suffering, mitigating severe damage in the absence of a specific request for assistance;
- Require national disaster recovery and housing strategies to clearly define the roles and responsibilities of federal agencies and other organizations during large scale disasters;
- Provide the President additional flexibilities under the individual assistance program to limit the excessive use of trailers in future disasters. Allows the use of semi-permanent housing in remote areas;
- Increase flexibility and imposes a total assistance cap on mitigation programs. The change institutes a sliding scale program for the post-disaster Hazard Mitigation Grant Program allowing 15 percent for disaster amounts no greater than $2 billion, 10 percent for disaster amounts between $2 - $10 billion, and 7.5 percent for disaster amounts between $10 - $35 billion. Removes the caps on repair or replacement assistance or individual assistance. Allows for utility payment, security deposits, and hook-up charges to be included in individual assistance;
- Allow the President to appoint a multi-state Federal Coordinating Officer;
- Requires the development of capabilities necessary to meet the needs of individuals with disabilities;
- Requires FEMA to develop a voluntary family registry and locator system and to coordinate with the National Center for Missing and Exploited Children in the Center's development of a National Emergency Child Locator Center;
- Requires FEMA in coordination with state and local governments to take into account populations with limited English proficiency, special needs populations, and individuals with disabilities in sharing best practices and maintaining and informational clearinghouse;
- Authorizes the President to provide transportation assistance to return evacuees to their residences;
- Allows the President to provide case management services to victims of major disasters to identify and address unmet needs;
- Allows the President to designate a Small State and Rural Advocate;
- Allows for the repair, restoration and replacement of damaged private non-profit educational facilities;
- Creates a housing pilot program to reduce the need for large scale trailer parks; and
- Creates a public assistance pilot program to create financial incentives to reduce total costs, prevent fraud, and expedite completion of two of the most expensive aspects of federal disaster assistance: debris removal and the reconstruction of public facilities."

(**NEMA**, *Legislative Report on Post-Katrina Emergency Management Reform Act of 2006*, October 10, 2006, pp. 7-8)

Staging Area (ICS): Staging areas are established for temporary location of available resources. Staging Areas will be established by the Operations Section Chief to enable positioning of and accounting for resources not immediately assigned. A Staging Area can be any location in which personnel, supplies, and equipment can be temporarily housed or parked while awaiting operational assignment. Staging Areas may include temporary feeding, fueling, and sanitation services. The Operations Section Chief assigns a manager for each Staging Area, who checks in all incoming resources, dispatches resources at the Operations Section Chief's request, and requests Logistics Section Support, as necessary, for resources located in the Staging Area. Personnel check in with the Resources Unit at the Staging Area, while supplies and equipment are checked in with the Supply Unit. If neither of these functions is activated, resources report to the Staging Area Manager for direction." (**DHS**, *NIMS*, 2004, ICS Annex, p. 96)

Staging Area: "Established for the temporary location of available resources. A Staging Area can be any location in which personnel, supplies, and equipment can be temporarily housed or parked while awaiting operational assignment." (**FEMA**, *NIMS Draft*, August 2007, p. 158)

Staging Area: [ICS/NIMS] "That location where incident personnel and equipment are assigned awaiting tactical assignment. Staging Areas are managed by the OSC." (**USCG**, *IM Handbook* 2006, Glossary 25-23)

Stakeholder: "Stakeholder (interested party) – person or group having an interest in the performance or success of an organization." (**ISO 22399**, *Societal Security*…, 2007, 7)

Stakeholder: "Any individual, group, or organization that might affect, be affected by, or perceive itself to be affected by the emergency." (**NFPA 1600**, 2007, p. 8)

Stakeholders: "Any person, group, or organization affected by and having a vested interest in the incident and/or the response operation." (**USCG**, *IM Handbook*, 2006, Glossary 25-23)

Standard Equipment List (SEL): "A list issued annually to promote interoperability and standardization across the response community at the local, state, and federal levels by offering a standard reference and a common set of terminology. It is provided to the responder community by the Inter-Agency Board for Equipment Standardization and Interoperability (IAB). The SEL contains a list of generic equipment recommended by the IAB to organizations in preparing for and responding to all-hazards." (**FEMA**, *NIMS Compliance Metrics Terms of Reference* (For Fiscal Year 2007), October 23, 2006, p. 9)

Standard Flood Insurance Policy Forms: "The NFIP offers three Standard Flood Insurance Policy forms. These forms provide policyholders with a description of their coverage and other important coverage information"

- Dwelling Policy Form
- General Property Policy Form

- Residential Condominium Building Association Policy (RCBAP) Form. (**FEMA**, *Standard Flood Insurance Policy Forms*, 2006)

Standard Operating Guidelines: "A set of instructions having the force of a directive, covering those features of operations which lend themselves to a definite or standardized procedure without loss of effectiveness." (**FEMA**, *NIMS Draft*, August 2007, p. 158)

Standard Operating Procedure (SOP): "SOPs provide the means to translate organizational tasking into specific action-oriented checklists that are very useful during emergency operations. They tell how each tasked organization or agency will accomplish its assigned tasks. Normally, SOPs include checklists, call- down rosters, resource listings, maps, charts, etc. and give **step-by-step procedures** for notifying staff, obtaining and using equipment, supplies, vehicles, obtaining mutual aid, reporting information to organizational work centers and the emergency operating center (EOC), communicating with staff members that are operating from more than one location, etc." (**FEMA**, *SLG 101*, 1996, p. 1-7)

Standard Operating Procedure (SOP): "Complete reference document or an operations manual that provides the purpose, authorities, duration, and details for the preferred method of performing a single function or a number of interrelated functions in a uniform manner." (**FEMA**, *National Incident Management System* (FEMA 501/Draft) August 2007, p. 158)

Standard Operating Procedure (SOP). "An organizational directive that establishes a course of action or policy." (**NFPA 1561**, 2002, p. 8)

Standard Operating Procedures (SOP): "A complete reference document that details the procedures for performing a single function or a number of interdependent functions." (**DHS**, *National Incident Management System*, March 2004, p. 36)

Standard Project Flood (SPF): "The Standard Project Flood, a "derived discharge" estimate, represents a flood that can be expected from the most severe combination of meteorologic and hydrologic conditions that are considered *reasonably characteristic* of the region. Where floods are predominantly the result of melting snow, the SPF is based on estimates of the most critical combinations of meteorological events (snow, rain, temperature, etc.) considered reasonably characteristic of the region. Since it is based on estimates of typical meteorological events, the Standard Project Flood is not associated with a specific return interval (as is the 100-year flood)." (**Galloway**, *A California Challenge*…, 2007, pp. 15-16)

"The U.S. Army Corps of Engineers indicates that the Standard Project Flood, "is intended as a practicable expression of the degree of protection to be considered for situations where protection of human life and high-valued property is required, such as for an urban levee or floodwall."32 It was the de facto U.S. Army Corps of Engineers standard until the 1980's when the institution of local-federal cost sharing for levee construction began. At that time, it became economically beneficial for communities to build only to the 100-year standard, given that achievement of 100-year protection removed the community behind the levee from the insurance and land-use requirements (and costs) of the National Flood Insurance Program and reduced the size (and the local costs) of the levee construction." (**Galloway**, 2007, 16)

Standard Project Flood (SPF): "The SPF is the flood that can be expected from the most severe combination of meteorologic and hydrologic conditions that are considered reasonably characteristic of the region in which the study basin is located. The SPF, which provides a performance standard for potential major floods, is based on the Standard Project Storm (SPS)." (**USACE**, *Engineering and Design – Hydrologic Engineering Requirements for Reservoirs*, Chapter 7, Flood-Runoff Analysis, 1997, p. 7-2)

Standard Project Storm (SPS): "The SPS is a hypothetical storm having the most severe flood-producing rainfall depth-area-duration relationship and areal distribution pattern that is considered reasonably characteristic of the region in which the drainage area is located. It is developed by studying the major storm events in the region, excluding the most extreme. Development of the SPS may involve transposition and adjustment of a large storm from its observed location to the locality of concern…" (**USACE**, *Water Resources Policies and Authorities…*, 1999, 13-2)

Standards for Civil Preparedness: "…Standards provide guidelines – not a 'bible' – for developing an improving civil preparedness. Local, State, and Regional Civil Preparedness professionals should use them as a primary reference in the preparation and review of Local Program Papers, and in On-Site Assistance projects…. Standards outline the work that each jurisdiction should do to build emergency readiness" (**DCPA**, *Standards for Local Civil Preparedness*, 1978, p. 2)

Standards for Civil Preparedness (1978):

1. Organization and Administration of Civil Preparedness
    1. Statement of Purpose
    2. Joint-Action vs. Individual Jurisdiction Approach
    3. Organizing Local Civil Preparedness Action
    4. Administration of Local Civil Preparedness Program
2. The Local Civil Preparedness Director/Coordinator
    1. Position and Responsibilities of the Local Director/Coordinator
    2. Civil Preparedness Staffing for Jurisdictions of Various Sizes
    3. Selection, Qualifications, and Salary of Local Director/Coordinator
    4. Professional Training and Growth
3. Tangible Components of Emergency Readiness: Local Government Emergency Plans
    1. Need for Local Emergency Plans
    2. Local Planning Process
    3. Hazard Analysis
    4. Organization and Content of Local Government Emergency Plans
    5. Nuclear Civil Protection Planning
        1. Fully-Qualified Emergency Planning Standard
        2. Minimum-Level Emergency Planning Standard
4. Tangible Components of Emergency Readiness: Facilities and Equipment
    1. Emergency Operating Center
    2. Shelter
    3. Radiological Defense

4. Warning System
5. Emergency Communications
6. Emergency Public Information
7. Law Enforcement
8. Fire Service
9. Rescue
10. Emergency Medical
11. Public Works Engineering
12. Emergency Welfare
13. Schools

5. Tangible Components of Emergency Readiness: Trained Personnel
    1. Training Required for Local Government Personnel
    2. Training for Personnel Required to Supplement/Extend Government Capabilities
    3. Training for the Public
6. Intangible Components of Emergency Readiness: Ability to Execute Emergency Plans
    1. Evaluating Local Ability to Execute Plans
        1. Fully-Qualified Readiness Standard
        2. Minimum-Level Readiness Standard

(**DCPA**, *Standards For Local Civil Preparedness* (CPG-1-5), April 1978, pp. iii-iv)

Standards for Local Civil Preparedness: "During the fiscal year [1973], Standards were developed jointly by local, State, and Federal civil preparedness officials, and were distributed as an aid to local officials for improving their ability to save lives and preserve property in all kinds of disasters. In addition, a Summary of the Standards stressing the 'why' of local civil preparedness was prepared and distributed to local officials. The Standards and Summary were prepared in cooperation with the Council of State Governments, the National Association of Counties, the National League of Cities and U.S. Conference of Mayors, and the International City Management Association." (**DCPA**, *Foresight, DCPA Annual Report FY 73*, 1974, p. 11)

Standardization: "A principle of the NIMS that provides a set of standardized organizational structures—such as the Incident Command System (ICS), multi-agency coordination systems, and public information systems—as well as requirements for processes, procedures, and systems designed to improve interoperability among jurisdictions and disciplines in various area, including: training; resource management; personnel qualification and certification; equipment certification; communications and information management; technology support; and continuous system improvement." (**DHS**, *National Incident Management* System, March 2004, p. 2)

Standardized Emergency Management System (SEMS) California: "In 1991, the Oakland Hills fires lasted three days, and destroyed some 1,600 acres, over 2,700 structures and killed 25 people. Damages were estimated at more than $1.68 billion.22 Emergency management experts criticized the handling of the fires because disparate agencies were poorly prepared to work together. In response, State and local officials developed SEMS as a management structure for coordinating and integrating emergency responses that involve multiple agencies and multiple jurisdictions. SEMS was developed to provide a standardized but flexible strategy for coordinating responses and integrating management efforts. SEMS can operate at five levels, though only the levels required to respond to a particular emergency are activated.

- *Field:* Refers to the incident level, where local officials manage responders and resources to meet needs. During large-scale events, there may be multiple field sites.
- *Local:* The local level refers to city, county or special districts. The local level coordinates and manages response within its jurisdiction.
- *Operational Area:* The operational area refers to the boundaries of a county. At the operational area, incident commanders manage response and serve as coordination and communication links between local and regional levels. Operational areas reflect county boundaries, but county officials do not necessarily lead operational area emergency management efforts.
- *Regional:* The State has six emergency management regions. The regional level coordinates information and resource movement among operational areas within the mutual aid region and between operational areas and the State.
- *State:* State resources are managed in response to the needs of other levels. State officials manage and coordinate assistance between the five local and state levels and the federal disaster response system. " (**Little Hoover**, *Safeguarding the Golden State*, 2007, 8-9)

Standardized National Planning Process and Integration System: "There is established a planning process involving three levels of planning: (a) strategic; (b) operational; and (c) tactical. The planning process will result in the development of a family of related planning documents to include strategic guidance statements, strategic plans, concepts of operations, operations plans, and as appropriate, tactical plans." (**White House**, *Annex I, "National Planning," to HSPD-8*, 2007, p. 2)

Standardized Terminology: "Commonly accepted language that is consistent with policies, plans, or procedures in the NIMS and NRP to facilitate multi-agency, multi-disciplinary or multi-jurisdictional communications during an incident." (**FEMA**, *NIMS Compliance Metrics Terms of Reference* (For Fiscal Year 2007), October 23, 2006, p. 10)

Standing Rules for the Use of Force for US Forces (SRUF): "Normally, force is to be used only as a last resort, and should be the minimum necessary. The use of force must be reasonable in intensity, duration, and magnitude based on the totality of the circumstances to counter the threat. If force is required, nonlethal force is authorized and may be used to control a situation and accomplish the mission, or to provide self-defense of DOD forces, defense of non-DOD persons in the vicinity if directly related to the assigned mission, or in defense of the protected property, when doing so is reasonable under the circumstances. Lethal force is authorized only when all lesser means have failed or cannot reasonably be employed and the circumstances otherwise justify the use of lethal force." (**JCS/DoD**, *Civil Support*, 2007, p. B-2)

STARC: State Area Command, Army National Guard. (**DoD**, *MSCA*, 1993, p. 23)

START: Simple Triage and Rapid Treatment. (Critical Illness and Trauma Foundation, Inc.)

State and Local Anti-Terrorism Training (SLATT): "The…SLATT program's primary objective is the delivery of specialized terrorism/extremism orientation, interdiction,

investigation, and prevention training to law enforcement executives, command personnel, intelligence officers, investigators, analytical personnel, training directors, and prosecutors. Each course is specifically designed to meet the needs of the target audience, from the street level officer to the executive." (**FEMA**, *Technical Assistance: Preparedness & Program Management: Technical Assistance Catalog*, no date, p. 8)

State and Urban Area Homeland Security Strategies: "…State and Urban Area Homeland Security Strategies provide a context for performing the strategic exercise of asking *"How are we organized?"* and *"How are we managing our homeland security programs?"* This evaluation will enable us as a Nation to think about how we build our preparedness programs and capabilities within and across State boundaries…. States and Urban Areas were recently required to update their strategies to bring them into alignment with the seven National Priorities included in the Goal. The updated strategies address the four homeland security mission areas: prevent, protect, respond, and recover." (**DHS/ODP**, *FY 2006 EMPG Program Guidance*, 2005, p. 8)

State and Urban Area Homeland Security Strategies Focus: "The current State and Urban Area Homeland Security Strategies address 2004, 2005, and 2006, and are mostly terrorism focused. In updating their strategies this year, States and Urban Areas should begin the process of evolving their strategies to address not only terrorism, but a broad range of other threats and hazards, founded on a capabilities-based planning approach. In the future, States and Urban Areas will be asked to develop enterprise-wide homeland security strategies for 2007, 2008 and 2009 that reflect the necessary integration and collaboration across all mission areas and support the establishment of the National Preparedness System and realization of the Goal." (**DHS/ODP**, *State and Urban Area Homeland Security Strategy: Guidance on Aligning Strategies with the NPG*, 2005, p. 8)

State and Urban Area Homeland Security Strategies Purpose: "The purpose of Homeland Security Strategies is to:

- Provide a blueprint for comprehensive, enterprise-wide planning for homeland security efforts;
- Provide a strategic plan for the use of related Federal, State, local, and private resources within the State and/or Urban Area before, during, and after threatened or actual domestic terrorist attacks, major disasters, and other emergencies."

(**DHS/ODP**, *State and Urban Area Homeland Security Strategy: Guidance on Aligning Strategies with the NPG*, 2005, p. 2)

State and Urban Area Homeland Security Strategy Core Elements: "The core elements of the strategy – the purpose, vision, and goals – rarely change over time." (**DHS/ODP**, *State and Urban Area HS Strategy: Guidance on Aligning Strategies with the NPG*, 2005, p. 28)

State Approving Official (SAO): "The person delegated the authority to request DFA and TA and commits the State cost-share for mission assignments, when applicable." (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 2007, p. 60)

State Coordinating Officer (SCO): "The SCO plays a critical role in managing the State response and recovery operations following Stafford Act declarations. The Governor of the affected State appoints the SCO, and lines of authority flow from the Governor to the SCO, following the State's policies and laws. For certain anticipated events in which a Stafford Act declaration is expected, such as an approaching hurricane, the Secretary of Homeland Security or the FEMA Administrator may pre-designate one or more Federal officials to coordinate with the SCO to determine resources and actions that will likely be required, and begin pre-deployment of assets. The specific roles and responsibilities of the SCO include:

> Serve as the primary representative of the Governor for the affected State or locality with the RRCC or within the JFO once it is established.
>
> Work with the Federal Coordinating Officer to formulate State requirements, including those that are beyond State capability, and set priorities for employment of Federal resources provided to the State.
>
> Ensure coordination of resources provided to the State via mutual aid and assistance compacts.
>
> Provide a linkage to local government.
>
> Serve in the Unified Coordination Group in the JFO." (**DHS**, *NRF Comment Draft*, September 2007, p. 50)

State Emergency Management Agency Director: "All States have laws mandating establishment of a State emergency management agency and the emergency operations plan coordinated by that agency. *The Director of the State emergency management agency ensures that the State is prepared to deal with large-scale emergencies and is responsible for coordinating the State response in any major emergency or disaster.* This includes supporting local governments as needed or requested, and coordinating assistance with the Federal Government." (**DHS**, *NRF Comment Draft*, September 2007, p. 19)

State Emergency Plan: "The State Plan which is designated specifically for State-level response to emergencies or major disasters and which sets forth actions to be taken by the State and local governments, including those for implementing Federal disaster assistance." (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 2007, p. 61)

State Emergency Response Commission (SERC): "Commission appointed by each State governor according to the requirements of Title Ill of SARA: duties of the commission include designating emergency planning districts, appointing local emergency planning committees (LEPCs), supervising and coordinating the activities of planning committees, reviewing emergency plans, receiving chemical release notifications, and establishing procedures for receiving and processing requests from the public for information. (**EPA**, *Technical Guidance for Hazards Analysis*, 1987, p. A-7)

State Homeland Security Advisor: "The State Homeland Security Advisor serves as counsel to the Governor on homeland security issues and *serves as a liaison between the Governor's office, the State homeland security structure, DHS* and other organizations both inside and outside of the State. The advisor often chairs a committee comprised of representatives of relevant State agencies, including public safety, the National Guard, emergency management, public health and others charged with developing preparedness and response strategies." (**DHS**, *NRF Comment Draft,* September 2007, p. 19)

State Homeland Security Grant Program: (See, also, "Homeland Security Grant Program")

State Homeland Security Program (SHSP): "State Homeland Security Grant Program supports the implementation of the State Homeland Security Strategy to address the identified planning, equipment, training, and exercise needs for acts of terrorism. In addition, SHSP supports the implementation of the National Preparedness Goal, the National Incident Management System (NIMS), and the National Response Plan." (**DHS**, S*tate Contacts & Grant Award Information*, July 18, 2007 Update.)

State Homeland Security Program (SHSP): "The State Homeland Security Program (SHSP) is a primary funding source for building homeland security capabilities that align with the National Preparedness Guidelines (NPG) at the state and local levels. States and localities use SHSP funds to build a wide range of homeland security capabilities. Most capabilities specific to terrorism are also applicable to large-scale natural disasters and public health emergencies. Grant allocations are based on an analysis of risk and effectiveness but each state is assured a minimum allocation. Projects funded under SHSP support building and sustaining capabilities at the state and local levels through planning, equipment, training, and exercise activities and helps states to implement the strategic goals and objectives included in state homeland security strategies." (**FEMA**, *Statement of R. David Paulison, Administrator, on the Fiscal Year 2009 President's Budget Before the Committee on Appropriations Subcommittee on Homeland Security, U.S. House of Representatives*, March 11, 2008, p. 4)

State Incident Communications Conference Line (SICCL): "The SICCL was created primarily to bring States together to share information and discuss issues that have an effect on all of them following an incident. This line is typically used during a multiple State disaster such as a hurricane where impacted States may request support from other States. The SICCL is not a 24/7 line. Instead, it is a scheduled conference call, which would be set up as needed to address issues. In summary, the SICCL is:
• used for the transmission and exchange of information primarily targeted to State and local communicators; and
• typically activated with a multiple State incident, and there is need for cross border coordination." (**FEMA**, *Basic Guidance for PIOs (FEMA 517)*, Nov 2007, 25)

State Management of Disasters Initiative (SMD), FEMA: "Under the State Management of Disasters (SMD) initiative, in some cases an interested and capable State, or Tribal government acting as its own Grantee, may manage the PA field operation, including project eligibility reviews, process control, and resource allocation on small disasters. The participating State voluntarily enters into an Operational Agreement with FEMA, which entrusts many aspects of

program management to the State. FEMA retains obligation authority, ensures compliance with environmental and historic preservation laws, participates in quality control reviews with the State, and provides technical assistance as requested by the State.

"Small disasters are disasters that warrant a major disaster declaration by the President, but are limited in scope and size generally as defined by the following:

- statewide infrastructure damage up to $2 per capita, or
- limited to debris removal and emergency protective measures.

For a State to be eligible to manage a disaster under this initiative, the State must have:

- recent disaster experience;
- adequate State staff;
- an SMD Addendum to the State Administrative Plan for Public Assistance;
- a fiscal accounting system that can track specific projects, prepare for and undergo audit, and be used to evaluate appeals;
- an established record of having met deadlines for grant management activities; and approval by FEMA. (**FEMA**, *Public Assistance Program*, June 2007)

State Preparedness Report: "The Secretary [DHS] shall require that any State applying to the Secretary for a covered grant must submit State Preparedness Report specified in section 652(c) of the Department of Homeland Security Appropriations Act, 2007 (Public Law 109-295)." (**US Congress**, *Implementing the 9/11 Commission Recommendations Act.…*, August 7, 2007, p. 13)

State Template Initiative: "The Template was built by state and local officials - those responsible for preventing, responding to, and recovering from the spectrum of terrorist threats and Homeland Security challenges that face the Nation in the 21st Century. The Template provides a common foundation for identifying and addressing key state and local vulnerability and capability shortfalls. This Template will be a useful tool in our effort to build and sustain the operational means by which we will make the Nation safer, stronger, and better."

"The initiative provides states a foundation for preparing comprehensive and compatible state, local and tribal Homeland Security plans. The *Template* is consistent with and supports implementation of the "*National Strategy for Homeland Security*." It was designed "*from the bottom up*," recognizes that "*one size does not fit all*," and enables the emergency responders and state and local officials who bear the responsibility of preventing terrorist attacks and protecting the Nation and its citizens." (**PHSAC**, *Statewide Template Initiative*, March 2003, p. 1)

Statewide Communication Interoperability Plan (SCIP): "The purpose of a locally-driven SCIP is to establish a future vision for communications interoperability and align emergency response agencies with that vision and the goals, objectives, and initiatives for achieving that vision across the State. DHS understands that different States, regions, and localities are at different stages in enhancing interoperability. As such, elements of many SCIPs will amount to a .plan to plan.. Some States. have processes, procedures, and other plans in place that allow them to easily address SCIP elements. Others do not and will through the SCIP show how they plan to do so in the future. Most States will have elements that have not addressed by the submission deadline and so will describe in the SCIP how they will be addressed in the future….

"The primary audience of SCIPs is officials at local, regional, tribal, and State levels of government responsible for ensuring interoperable communications for the emergency response community. A SCIP should define a strategic vision and set of goals and objectives for improving interoperable communications statewide. It should be a living document, updated as frequently as needed and at least annually, that provides strategic direction and alignment for those responsible for interoperable communications at the local, regional, and State level. The SCIP also must be written with peer reviewers and Federal officials in mind, as the Public Safety Interoperable Communications (PSIC) Grant Program and the Homeland Security Grant Program have required the development of SCIPs" (**DHS/OEC**, *Statewide Communication Interoperability Plan FAQs*, September 2007, p. 1)

STE: Secure Telephone Equipment. (**FEMA** *IIFOG Ver 3*, Feb 2008, 22)

Steady State Plans. "Steady state plans are normally the result of crisis contingency operations that have evolved to a rotational operation. CJCS orders to the supported commander, supporting commanders, and Services initiate such operations. These orders define plan details and requirements to accomplish the mission and authority to deploy forces. Such orders generally identify specific weapons systems, but not the ECS forces needed to sustain the operation." (**Vermont Air National Guard**, *Mobilization Activation*)

Steady-State Preparedness/Readiness: "*A national focus on steady-state readiness is imperative.* The *Framework* [NRF] focuses on preparedness activities that are *directly related to an evolving incident or potential incident.* The *National Preparedness Guidelines* and the *NIPP* focus on *steady-state preparedness or readiness activities* conducted in the absence of a specific threat or hazard. This response *Framework* does not try to subsume all of these larger efforts; instead, it integrates these efforts and brings them to bear in managing incidents." (**DHS**, *NRF Comment Draft*, September 2007, p. 68) [DHS, NIMS, 2004, at p. 33 notes that preparedness for incident management should be developed "on a steady-state" basis, presumably meaning maintained rather than not maintained.]

STI: State Template Initiative.

STO: State Training Officer.

Storm: "1. An atmospheric disturbance involving perturbations of the prevailing pressure and wind fields, on scales ranging from tornadoes (1 km across) to extratropical cyclones (2000-3000 km across).
2. Wind with a speed between 48 and 55 knots (Beaufort scale wind force 10)." (**UNDHA**, *DM Glossary*, 1992, 71)

Storm Surge: "An abnormal rise in sea level accompanying a hurricane or other intense storm, and whose height is the difference between the observed level of the sea surface and the level that would have occurred in the absence of the cyclone. Storm surge is usually estimated by subtracting the normal or astronomic high tide from the observed storm tide." (**NHC**, *Glossary of NHC Terms*, 2007)

Storm Surge: The difference between the actual water level under influence of a meteorological disturbance (storm tide) and the level which would have been attained in the absence of the meteorological disturbance (i.e. astronomical tide). (**WMO** 1992, 584)

STQ: Screening Threshold Quantities. (**DHS**, "Fact Sheet: CFATS" November 2, 2007)

Strategic Decision Making Exercise (SDME): "The SDME is a political-military decision-making collective simulation exercise designed to provide USAWC [US Army War College] students an opportunity to role-play strategic leaders and staffs as they integrate and apply knowledge acquired previously in the USAWC core curriculum… The SDME is a joint and multinational exercise that includes political and military play at the high operational and strategic levels… It is intended to place students in a volatile, uncertain, complex, and ambiguous virtual environment, aided by appropriate information technology tools and models, in which they apply service and joint doctrine within the framework of the interagency, military contingency planning and execution, military resourcing, and multinational coordination processes. Students will develop strategic policy recommendations for employing the diplomatic, informational, military, and economic elements of power, while considering multiple scenarios. Those scenarios include major combat operations, lesser contingencies, stability operations, global terrorism, disaster relief, and humanitarian assistance, and model crises in every Geographic Combatant Command, to include the new US Africa Command.

"The exercise involves the entire USAWC student body, USAWC staff and faculty members, subject matter experts, and invited guests. Students role-play leaders of selected elements of the interagency community at the strategic level which include the Deputy National Security Advisor, the Under Secretary of Defense for Policy, the Under Secretary of State for Political Affairs, and the Deputy Secretary for Homeland Security. In addition, students…assume military leadership and staff roles across the Geographic Combatant Commands and the Joint and Service staffs. Students engage in policy coordination and deputies committee meetings to formulate and implement national security policy that involves the use of all elements of national power. During the SDME, they also execute Congressional testimony, conduct press briefings and short notice interviews with media representatives, and brief senior officials from the government, business, military and academic communities… The SDME is the capstone exercise event for the USAWC students. It serves not only as a critical learning vehicle but also as an instrument to review and refine future decisions regarding the overall USAWC curriculum." (**USAWC**, *Information Paper: The Strategic Decision Making Exercise*, Nov. 8, 2007)

Strategic Goal: "A broad target that defines how the Agency will carry out its mission over a five to seven year period of time." (**FEMA**, *A Nation Prepared – FEMA Strategic* Plan, 2002, p. 60)

Strategic Goals: "Strategic goals are broad, general statements of intent." (**USCG**, *IM Handbook*, 2006, Glossary 25-23)

Strategic Guidance Statement (SGS): "The term 'strategic guidance statement' refers to a document that outlines strategic priorities, broad national strategic objectives, and basic assumptions; describes the envisioned end-state; and establishes the general means necessary to

accomplish that end." (**White House**, *Annex I "National Planning" to HSPD-8*, December 2007, p. 1)

Strategic Guidance Statements (SGS): Strategic Guidance Statements (SGS) are required for each national planning scenario and establish the foundation for the development of each Strategic Plan. SGS will be developed by DHS Office of Operations Coordination and issued by the Secretary of Homeland Security. Strategic Plans are required for each Strategic Guidance Statement; they will define specific Federal interagency roles, responsibilities, mission essential tasks, capabilities and supporting metrics; and provide strategic guidance to support the development of interagency operational level Concept Plans (CONPLAN). Strategic Plans will be developed by DHS Office of Operations Coordination and issued by the Secretary of Homeland Security. (**FEMA**, *(Interim) Integrated Planning System (IPS) for Homeland Security (Draft Version 2.3)*, July 3, 2008 copy, p. iv, footnotes 1 and 2)

Strategic Guidance Statement (SGS): "The Secretary of Homeland Security shall develop a strategic guidance statement for each National Planning Scenario, in coordination with the heads of Federal agencies with a role in homeland security. Additional planning requirements shall be developed as the Secretary, in coordination with Federal agencies with a role in homeland security, deems appropriate. The Incident Management Plan Team (IMPT)[119] shall develop each SGS for the Secretary." (**FEMA**, *(Interim) Integrated Planning System (IPS) for Homeland Security (Draft Version 2.3)*, July 3, 2008 copy, p. 3-1)

Strategic Information Operations Center (SIOC). "The SIOC is the focal point and operational control center for all Federal intelligence, law enforcement, and investigative law enforcement activities related to domestic terrorist incidents or credible threats, including leading attribution investigations. The SIOC serves as an information clearinghouse to help collect, process, vet, and disseminate information relevant to law enforcement and criminal investigation efforts in a timely manner. The SIOC maintains direct connectivity with the NOC [DHS HQ]." (**DHS**, *National Planning and Execution System*, 2007 Draft, p. 3-6)

Strategic Management Perspective: "The strategic management perspective is characterized as a long-term process for developing a continuing commitment to the mission and vision of an organization, nurturing a culture that identifies with and supports the mission and vision, and maintaining a clear focus on the organization's strategic agenda throughout all its decision processes and activities." (Choi, "Emergency Management: Implications from a Strategic Management Perspective." *Journal of HLS and EM*, Vol. 5, Issue 1, Article 1, 2008, 1)

"…although there exist different perspectives on strategic management, most approaches contain several common elements. First, strategic management is characterized by strategic planning but not limited to it. Second, strategic management links planning and budgeting. Third, successful implementation of strategic management requires an assessment of organizational capacities in such areas as managerial capability, power structure, culture, and leadership." (Ibid, 5)

---

119 The Incident Management Planning Team (IMPT) is an interagency permanent planning cell staffed by full-time planners; it also functions under a charter that enables it to surge using part-time planners and to reach into Federal agencies to rely on functional subject matter experts.

"Recent emergency management practice demands that more strategic approaches and management should be utilized than before. What benefits can we get from integrating strategic management into emergency management?.... the following aspects can be considered: forward thinking, professionalization, capacity building, goal identification and achievement, increased public support, more funding, and increased accountability." (Ibid, 8)

Strategic National Stockpile (SNS): "CDC's Strategic National Stockpile (SNS) has large quantities of medicine and medical supplies to protect the American public if there is a public health emergency (terrorist attack, flu outbreak, earthquake) severe enough to cause local supplies to run out. Once Federal and local authorities agree that the SNS is needed, medicines will be delivered to any state in the U.S. within 12 hours. Each state has plans to receive and distribute SNS medicine and medical supplies to local communities as quickly as possible…. The medicine in the SNS is FREE for everyone. The SNS has stockpiled enough medicine to protect people in several large cities at the same time. Federal, state and local community planners are working together to ensure that the SNS medicines will be delivered to the affected area to protect you and your family if there is a terrorist attack." (**CDC**, *Strategic National Stockpile*, April 2005, p. 1)

Strategic National Stockpile (SNS): "The SNS is positioned in undisclosed locations throughout the United States and configured to provide a flexible response strategy. Included in the formulary are a dozen 12-hour Push Packages which contain over 50 tons of broad spectrum antibiotics and medical materiel. These assets are pre-configured in deployable containers and strategically located to enable rapid delivery to the site of a national emergency within 12 hours of the federal decision to deploy. The majority of the SNS formulary is maintained in managed inventory. Like the 12-hour Push Packages, these assets are also strategically located around the nation and provide the ability to configure and deliver significant quantities of pharmaceuticals and medical materiel as an initial response if the nature of the public health emergency is well defined, or as follow-on to a "push package" delivery. Delivery of assets from managed inventory are planned to begin arriving within 24 to 36 hours after the federal decision to deploy them. Quantities in the SNS change based on national planning guidance and prioritization, modeling scenarios, and standard inventory management procedures. Some of the contents of the national stockpile include:
■ Enough smallpox vaccine to protect 300 million people, or every man, woman, and child in America;
■ Over 41 million regimens of countermeasures against anthrax;
■ Therapeutic anthrax antitoxins to treat symptomatic patients;
■ Countermeasures to address radiation exposure including over 460,000 combined doses of Calcium-DTPA (Diethylenetriamine pentaacetate) and Zinc-DTPA; and
■ 1.7 million doses of liquid potassium iodide (KI) in a formulation that is more suitable for young children for use in the event of a release of radioiodines.

"The SNS also has been increasing its supply of countermeasures that could be used during an influenza pandemic." (**Trust for America's Health**, *Ready or Not?* 2007. p. 22)

Strategic Objective (ICS): "A written statement describing an intended outcome; a results-oriented objective. (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 58)

Strategic Objective: "…a strategic objective is a specific statement of desired achievement that supports a strategic goal, and sets a target level of performance over time expressed as a tangible, measurable objective, against which actual achievement can be compared." (**DHS**, *Fiscal Year 2007 Homeland Security Grant Program: Investment Justification Reference Guide*, January 2007, P. 54)

Strategic Objective: "A specific step necessary to achieve a strategic goal." (**FEMA**, *A Nation Prepared – FEMA Strategic Plan – Fiscal Years 2003-2008*, 2002, p. 60 (Glossary))

Strategic Objectives of Homeland Security: "The strategic objectives of homeland security in order of priority are to:

• Prevent terrorist attacks within the United States;
• Reduce America's vulnerability to terrorism; and
• Minimize the damage and recover from attacks that do occur." (**White House**, *National Strategy for Homeland Security*, 2002, p. vi)

Strategic Partnership Program Agroterrorism (SPPA) Initiative: "The Department of Homeland Security (DHS), U.S. Department of Agriculture (USDA), Food and Drug Administration (FDA), and the Federal Bureau of Investigation (FBI) will collaborate with private industry and the States in a joint initiative, the Strategic Partnership Program Agroterrorism (SPPA) Initiative. The SPPA Initiative will be a true partnership program, where an industry member or trade association or State may volunteer to participate. To volunteer, the industry or State member must submit a completed response form. Program Objectives:

The federal government members in partnership with industry and State volunteers, plan to:

- Validate or identify sector-wide vulnerabilities by conducting critical infrastructure/key resources (CI/KR) assessments in order to:
    - Identify gaps;
    - Inform Centers of Excellence and Sector Specific Agencies (SSA) of identified research needs; and
    - Catalog lessons-learned.
- Identify indicators and warnings that could signify planning for an attack.
- Develop mitigation strategies to reduce the threat/prevent an attack. Strategies may include actions that either industry or government may take to reduce vulnerabilities.
- Validate assessments conducted by the United States Government (USG) for food and agriculture sectors.
- Gather information to enhance existing tools that both USG and industry employ.
- Provide the USG and the industry with comprehensive reports including warnings and indicators, key vulnerabilities, and potential mitigation strategies.
- Provide sub-sector reports for the USG that combines assessment results to determine national critical infrastructure vulnerability points to support the National Infrastructure Protection Plan (NIPP) and national preparedness goals.

- Establish and/or strengthen relationships between Federal, State, and local law enforcement and the food and agriculture industry along with the critical food/agriculture sites visited. (**FDA**, *Strategic Partnership Program Agroterrorism (SPPA) Initiative*…, August 2005, p. 1)

Strategic Plan: "Strategic plans are tools that assist organizations with defining their missions, goals and objectives; approaches toward achieving goals and objectives; and, methods for measuring the success of a program. Such plans communicate goals and objectives to constituencies, develop a sense of ownership by responsible officials, and provide a mechanism whereby an organization can develop strategies for leveraging scarce resources in a cost effective manner. Like a budget, a strategic plan should be established and built upon each year so that it addresses the changing needs and priorities of the organization." (**City of LA**. *Audit of the City of Los Angeles' Emergency Planning Efforts and Citywide Disaster Preparedness*, 2008, iii)

Strategic Plan: "A long-range planning document that defines the mission of the Agency and broadly identifies how it will be accomplished, and that provides the framework for more detailed annual and operational plans." (**FEMA**, *A Nation Prepared*,, 2002, p. 60 (Glossary))

Strategic Plan: "Is a plan that addresses long-term issues such as impact of weather forecasts, time–phased resource requirements, and problems such as permanent housing for displaced disaster victims, environmental pollution, and infrastructure restoration." (**USCG**, *Incident Management Handbook*, 2006, Glossary, p. 25-23)

Strategic Plan: "The term 'strategic plan' refers to a plan that defines the mission, identifies authorities, delineates roles and responsibilities, establishes mission essential tasks, determines required and priority capabilities, and develops performance and effectiveness measures." (**White House**, *Annex I "National Planning" to HSPD-8*, December 2007, p. 2)

Strategic Planning: "…a framework for carrying out strategic thinking, direction, and action leading to the achievement of consistent and planned results. Seven specific elements comprise this framework: organization mission, strategic analysis; strategy, long-term objectives, integrated programs, financial projections [and] executive summary…. A distinctive aspect of this process is its emphasis on team planning. It is this process that builds organization wide belief and commitment to the strategic plan because the participants have ownership." (**Below**, 1987)

Strategic Planning: Interagency Definition -- "The process by which requirements are generated, long-range goals, priorities, and responsibilities are agreed upon, and performance and effectiveness measures are developed and applied in order to execute National policy." "Responsible Organization: Secretary of DHS under HSPD 5 supported by IMPT." (**DHS**, *Interagency Planning Workshop* (slide #22), November 29, 2007)

Strategic Planning: "Strategic planning involves the adoption of long-range goals and objectives, the setting of priorities, the establishment of budgets and other fiscal decisions, policy development, and the application of measures of performance or effectiveness." (**FEMA**, *NIMS* (FEMA 501/Draft), August 2007, p. 17)

Strategic Planning and Requirements (SRPP): "The Strategic Requirements Planning Process (SRPP) provides a link between the high-level goals and objectives of the DHS Strategic Plan to the programs and activities executed by DHS components. Key products of the SRPP are CORE strategic requirements documents, which are used to identify critical capability gaps and redundancies." (**DHS**, *IPG FY 2011-2015 Draft*, Oct 2008, p. 5)

Strategic Planning for Homeland Security Preparedness: "Definition: The art and science of developing and employing instruments of national and State/territorial power (information, technology, economic, intelligence, and military) in a synchronized and integrated fashion to achieve the objectives of the National Strategy for Homeland Security, the National Preparedness Guidelines, the NRP, and supporting State/territorial and local strategic direction and guidance. Strategic planning uses gap analysis to develop programmatic priorities that address the mission requirements, goals, objectives, milestones, and resources to ensure interoperable and integrated synchronization throughout all levels of government and nongovernmental organizations for all hazards, incident-related prevent, protect, respond and recover activities." (**DHS**, *TCL*, 2007, pp. 21-22)

Strategic Vision for the War on Terror: "From the beginning, the War on Terror has been both a battle of arms and a battle of ideas – a fight against the terrorists and their murderous ideology. In the short run, the fight involves the application of all instruments of national power and influence to kill or capture the terrorists; deny them safe haven and control of any nation; prevent them from gaining access to WMD; render potential terrorist targets less attractive by strengthening security; and cut off their sources of funding and other resources they need to operate and survive. In the long run, winning the War on Terror means winning the battle of ideas. Ideas can transform the embittered and disillusioned either into murderers willing to kill innocents, or into free peoples living harmoniously in a diverse society.

The battle of ideas helps to define the strategic intent of our National Strategy for Combating Terrorism. The United States will continue to lead an expansive international effort in pursuit of a two-pronged vision:
• The defeat of violent extremism as a threat to our way of life as a free and open society; and
• The creation of a global environment inhospitable to violent extremists and all who support them." (**White House**, *National Strategy for Combating Terrorism*, September 2006, p. 7)

Strategy: "Definition: statement for a course of action or actions to be taken in order to achieve objective(s). Annotation: Doctrine encompasses the fundamental principles which guide an organization and "shapes the effort." Policy includes the process implemented through plans and procedures towards realization of doctrine and "guides the effort." Strategy is the course of action to achieve policy goals and 'accomplishes the effort'." (**DHS**, *Lexicon*, Oct. 2007, p. 25)

Strategy: "The general direction selected to accomplish incident objectives set by the Incident Commander." (**DHS**, *National Incident Management System*, March 2004, p. 137)

Strategy: "A description of how a strategic objective will be achieved." (**FEMA**, *A Nation Prepared – FEMA Strategic Plan – Fiscal Years 2003-2008*, 2002, p. 60 (Glossary))

Strategy: "The general plan or direction selected to accomplish incident objectives." (**FEMA**, *NIMS Draft*, August 2007, p. 158)

Strategy: "A goal or set of goals used to manage incident scene operations from which an incident action plan is developed." (**NFPA 1561**, 2002, p. 8)

Strategy: "The general plan or direction selected to accomplish incident objectives." (**USCG**, *IM Handbook*, 2006, Glossary 25-23)

Strategy for Catastrophic Incident Planning: "Achieving a robust and sustainable national capability to rapidly and successfully meet the immense challenges posed by an incident of catastrophic magnitude will require a unified strategy supported by aggressive leadership, joint collaboration, innovative thinking, significant funding, and national resolve. To that end, this Strategy for Catastrophic Incident Planning (SCIP) establishes a comprehensive and ambitious set of unified goals and objectives, and will provide a baseline against which to identify, validate, align and prioritize necessary capability-building initiatives…. There is agreement throughout the emergency management community that the existing plans, policies, procedures, and resources are not fully adequate or appropriate to address the destruction caused by a catastrophic hurricane, an earthquake, or a terrorist attack using a weapon of mass destruction" (**FEMA**, *Strategic Plan*, October 10. 2007, p. 4)

Strategy for Homeland Defense and Civil Support: "Directed by the Strategic Planning Guidance (March 2004), the Strategy for Homeland Defense and Civil Support integrates the objectives and guidance expressed in the National Security Strategy, the National Strategy for Homeland Security, and the National Defense Strategy to guide Department of Defense operations to protect the US homeland." (**DoD**, *Strategy for HD and Civil Support*, 2005, p. 6)

"The *Strategy for Homeland Defense and Civil Support* calls for securing the United States from attack through an active, layered defense in depth. This active layered defense seamlessly integrates US capabilities in the forward regions of the world, in the geographic approaches to US territory, and within the US homeland." (**JCS**, *Homeland Defense*, 2007, I-5)

Strengthen Planning and Citizen Preparedness Capabilities, A National Priority (DHS):

"Objective: Educate, train, organize and involve citizens with emergency preparedness and homeland security efforts by June, 2008.

Objective: Develop a Statewide Citizen Corps Marketing Campaign for implementation by September, 2008.

Objective: Establish a Neighborhood Watch program in every county statewide and expand the program to larger cities/towns by December 2007. (**Tennessee OEM**, *FY 2007 Tennessee Strategy – Goals and Objectives*, p. 4)

Strike-Slip Fault: "A generally vertical fault along which the two sides move horizontally past each other. The most famous example is California's San Andreas Fault." (**USGS**, *Putting Down Roots in Earthquake Country*, 2007, Glossary)

Strike Team: "A set number of resources of the same kind and type that have an established minimum number of personnel." (DHS, NIMS, 2004, p. 137)

Strike Team: "A set number of resources of the same kind and type that have an established minimum number of personnel, common communications, and a leader." (**FEMA**, *NIMS Draft*, August 2007, p. 158)

Strike Team: [ICS/NIMS] "Are specified combinations of the **same kind and type** of resources with common communications and a leader." (**USCG**, *IM Handbook*, 2006, Glossary 25-23)

Structural Fire Fighters' Protective Clothing (SFPC): "This category of clothing, often called turnout or bunker gear, means the protective clothing normally worn by fire fighters during structural fire fighting operations. It includes a helmet, coat, pants, boots, gloves and a hood to cover parts of the head not protected by the helmet and facepiece. This clothing must be used with full-facepiece positive pressure self-contained breathing apparatus (SCBA). This protective clothing should, at a minimum, meet the OSHA Fire Brigades Standard (29 CFR 1910.156). Structural fire fighters' protective clothing provides limited protection from heat and cold, but may not provide adequate protection from the harmful vapors or liquids that are encountered during dangerous goods incidents." (**DOT**, *Emergency Response Guidebook*, 2004, p. 350)

Structural Flood Mitigation: "Structural system for reduction of the effects of floods using physical solutions, including reservoirs, levees, dredging, diversions, and flood-proofing." (**UNDHA**, *DM Glossary*, 1992, 72)

STU: Secure Telephone Unit. (**FEMA** *IIFOG Ver 3*, Feb 2008, 22)

SU: Surge Account, FEMA.

SUASI: Super Urban Areas Security Initiative. (**DHS**, January 3, 2006 Press Release)

Subduction Zone: "A boundary along which one plate of the Earth's outer shell descends (subducts) at an angle beneath another. A subduction zone is usually marked by a deep trench on the sea floor. An example is the Cascadia Subduction Zone offshore of Washington, Oregon, and northern California. Most tsunamis are generated by subduction-zone earthquakes." (**USGS**, *Putting Down Roots in Earthquake Country*, 2007, Glossary)

Subject Matter Expert (SME): "SMEs add functional knowledge and expertise in a specific area or in performing a specialized job, task, or skill to the *exercise planning team*. They help to make the *scenario* realistic and plausible, and ensure jurisdictions have the appropriate *capabilities* to respond." (**FEMA**, *Homeland Security Exercise and Eval Pgm Glossary*, 2008)

Subsidence: "Depressions, cracks, and sinkholes in the earth's surface which can threaten people and property. Subsidence depressions, which normally occur over many days to a few years, may damage structures with low strain tolerances such as dams, factories, nuclear reactors,

and utility lines. The sudden collapse of the ground surface to form sinkholes many tens of yards wide and deep within the span of a few minutes to a few hours, poses an immediate threat to life and property. Such mass-gravity movements commonly continue for days, weeks, months, or even years until the walls stabilize." (**FEMA**, *Hazard Identification*…, 1985, p. A-3)

Subsidence: "Collapse of a considerable area of land surface, due to the removal of liquid or solid underlying or removal of soluble material by means of water." (**UNDHA**, *DM Glossary*, 1992, 72)

Succession: "Designated Successor to Authority. An individual, who by virtue of the position held, is designated by law or executive order to succeed to the position of and act as a particular statutory official in the event of the death, disability, or absence of that official. Such succession to office is on a temporary or interim basis and does not vacate the statutory position currently held by the incumbent." (**USACE**, *Planning and Operations Guidelines, Annex V: Definitions and Common* Terms, 1985, p. V-2)

Sulfur Mustard (Mustard Gas): "Sulfur mustard is a type of chemical warfare agent. These kinds of agents are called vesicants or blistering agents, because they cause blistering of the skin and mucous membranes on contact. Sulfur mustard is also known as "mustard gas or mustard agent," or by the military designations H, HD, and HT. Sulfur mustard sometimes smells like garlic, onions, or mustard and sometimes has no odor. It can be a vapor (the gaseous form of a liquid), an oily-textured liquid, or a solid. Sulfur mustard can be clear to yellow or brown when it is in liquid or solid form." (**CDC**, *Facts About Sulfur Mustard*, March 12, 2003 Modification)

Super Urban Areas Security Initiative (SUASI): "In fiscal year 2006, the department identified 35 areas eligible to apply for and receive funding. These 35 areas encompass 95 cities with populations of 100,000 or more. This year's formula promotes a "super" UASI concept that is designed to build greater regional capabilities across a geographic area." (**DHS**, "DHS Introduces Risk-Based Formula for Urban Areas Security Initiative Grants," January 3, 2006)

Superfund: "The trust fund established initially under the Comprehensive Environmental Response, Compensation, and Liability Act and extended under the Superfund Amendments and Reauthorization Act to provide money that can be used during cleanups associated with inactive hazardous waste disposal sites." (**FEMA** 1992)

Superfund Amendments and Reauthorization Act of 1986 (SARA): "In October 1986… SARA was enacted. Title Ill of SARA is also known as the Emergency Planning and Community Right-to-Know Act. Section 303 of SARA required the NRT to publish guidance to assist local emergency planning committees (LEPCs) with the development and implementation of comprehensive hazardous materials emergency response plans." (**EPA**, *Technical Guidance for Hazards Analysis*, 1987, p. i)

Supervisor (ICS): "The emergency services personnel who have supervisory authority and responsibility over other personnel." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 58)

Supply Chain Management Approach: "DHS/FEMA Logistics has adopted a Supply Chain Management approach to managing Federal Logistics processes. Supply Chain Management focuses on integrating the end-to-end supply chain processes, beginning with planning of customer-driven requirements for materiel and services, delivery to disaster victims as requested by the State or tribe, and ending with replenishment of agency inventories." (**DHS**, *NRF Logistics Management Support Annex*, September 2007 Draft, p. 5)

Supply Unit: "The unit within the Support Branch of the Logistics Section responsible for ordering the equipment and supplies required for incident operations." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 58)

Support Agency. "A federal department or agency designated to assist a specific primary agency with available resources, capabilities, or expertise in support of emergency support response operations, as coordinated by the representative of the primary agency." (**JCS/DoD**, *Civil Support*, 2007, p. GL-12)

Support Annexes (NRF): "…*Support Annexes* describe essential supporting aspects of the Federal response that are common to all incidents, such as financial management, volunteer and donations management and private sector coordination." (**DHS**, *NRF Comment Draft*, Sep 2007, p. 71)

Support Branch (ICS): "A branch within the Logistics Section responsible for providing personnel, equipment and supplies to support incident operations and includes the Supply, Facilities and Ground Support Units. (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 58)

Support Joint Information Center (JIC) "A support JIC is established to supplement the efforts of several Incident JICs in multiple States. It offers additional staff and resources outside of the disaster area. (**FEMA**, *Basic Guidance for PIOs (FEMA 517)*, Nov 2007, p. 16)

Supporting Technologies (NIMS 2005-2006): 5th of five Compliance Assessment Metrics. "Technology and technological systems provide supporting capabilities essential to implementing and continuously refining the NIMS. These include voice and data communications system, information systems, and display systems. These also include specialized technologies that facilitate incident operations and incident management activities in situations that call for unique technology-based capabilities." (**FEMA**, *NIMSCAST Technical Users Guide Version 1.1*. April 30, 2007, p. 28)

Surface Burst: "The explosion of a nuclear (or atomic) weapon at the surface of the land or water at a height above the surface less than the radius of the fireball at maximum luminosity (in the second thermal pulse). An explosion in which the weapon is detonated actually on the surface…is called a *contact surface burst or a true surface burst*." (**Glasstone**, *The Effects of Nuclear Weapons*, 3rd Ed., 1977, Glossary, p. 640)

Surge Account: "An account established by the FEMA Office of Financial Management to provide funds to support pre-declaration disaster activation." (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 2007, p. 61)

Surge Capacity: "the ability to expand capabilities in response to sudden or more prolonged Demand…" (**JCAHO**, *Health Care at the Crossroads*, 2003, p. 19)

Surge Capacity Force: "SEC. 624. SURGE CAPACITY FORCE. (a) ESTABLISHMENT.—(1) IN GENERAL.—Not later than 6 months after the date of enactment of this Act, the Administrator shall prepare and submit to the appropriate committees of Congress a plan to establish and implement a Surge Capacity Force for deployment of individuals to respond to natural disasters, acts of terrorism, and other man-made disasters, including catastrophic incidents. (2) AUTHORITY. (A) IN GENERAL.—Except as provided in subparagraph (B), the plan shall provide for individuals in the Surge Capacity Force to be trained and deployed under the authorities set forth in the Robert T. Stafford Disaster Relief and Emergency Assistance Act…. (b) EMPLOYEES DESIGNATED TO SERVE.—The plan shall include procedures under which the Secretary shall designate employees of the Department who are not employees of the Agency and shall, in conjunction with the heads of other Executive agencies, designate employees of those other Executive agencies, as appropriate, to serve on the Surge Capacity Force. (c) CAPABILITIES.—The plan shall ensure that the Surge Capacity Force—(1) includes a sufficient number of individuals credentialed in accordance with section 510 of the Homeland Security Act of 2002, as amended by this Act, that are capable of deploying rapidly and efficiently after activation to prepare for, respond to, and recover from natural disasters, acts of terrorism, and other man-made disasters, including catastrophic incidents; and (2) includes a sufficient number of full-time, highly trained individuals credentialed in accordance with section 510 of the Homeland Security Act of 2002, as amended by this Act, to lead and manage the Surge Capacity Force…." (**Post-Katrina Emergency Management Reform Act of 2006**, p. 1419-1420)

Surplus Lines of Insurance: "1Surplus lines' refers to any type of insurance for which there is no available market within a state and which the state allows nonadmitted insurers to offer. A 'nonadmitted' insurer is not licensed to do standard business in the state." (**GAO**, *Natural Disasters; Public Policy Options*…, Nov 2007, p. 12)

Survivable Communications: "The establishment and maintenance of an assured end-to-end communications path during all phases of a nuclear event." (**DHS**, *FCD 1*, Nov. 2007, P-9)

Survivable Crisis Management (SCM): "Survivable Crisis Management (SCM) is an operational capability the Federal Emergency Management Agency (FEMA) seeks to achieve in the States and Territories. The SCM capability FEMA seeks to achieve is the ability of each of the States and Territories to survive a catastrophic emergency and be able to direct, control, and coordinate emergency operations within the State and in coordination and cooperation with other States and the Federal Government. The objective of the SCM initiative is to develop a network of survivable capabilities within each State, nationwide among the States, and between the States and the Federal Government to ensure that States can continue to govern." (**FEMA**, *Survivable Crisis Management Plan Development Guide*, April 1993, p. 5)

Survivable Crisis Management (SCM) Elements:

- Dedicated, Technically Qualified, and Trained People
- Exercised and Tested Plans and Procedures
- Operationally Ready Emergency Facilities
- Operationally Ready Support Equipment
- Operationally Ready Communications
- Safeguarded Vital Records and Databases
- Established Lines of Succession and Delegations of Authority. (**FEMA**, *An Introduction to SCM*, Sep 1993, 3)

Survivable Crisis Management (SCM) Process:

- Assess risks and threats to State or Territory
- Define the required SCM capabilities
- Access existing capabilities in light of requirements.
- Identify deficiencies
- Develop a plan to correct deficiencies and achieve the required capabilities
- Develop contingency plans to deal with deficiencies until they are corrected
- Develop and conduct exercises to evaluate the operational capabilities to people, facilities, and equipment
- Work with FEMA to obtain technical support and Federal civil defense funding assistance.

(**FEMA**, *An Introduction to Survivable Crisis Management*, Sep 1992, 1; **FEMA**, *SCM Plan Development Guide*, 1993, p. 5)

Survivable Crisis Management (SCM) Rationale: "During Hurricane Hugo in 1989, some emergency management structures, as well as governing authorities, were so heavily damaged that massive external resources were required to reconstitute and reconstruct basic crisis management and life-sustaining capabilities. In short, the government itself became the victim. The SCM Initiative is designed to assure the development of a minimum infrastructure of SCM capabilities by each State and Territory that should prevent such a situation from occurring again." (FEMA, *An Introduction to Survivable Crisis Management*, Sep 1992, 6)

"The worst damages to human life, property, and reputation usually are set in motion within the first few hours. If the leaders responsible for managing emergencies and the capabilities needed for them to do so are not ready and survivable when the situations occur, the consequences can be catastrophic. That is why Survivable Crisis Management should be a high priority for the Federal Government and for every State and Territory in the United States." (Ibid, 13)

Survival Planning: Initiated by the FCDA in 1955. "The survivil of populations likely to be the targets of thermonuclear weapons will depend upon balanced evacuation and shelter measures; evacuation – to escape blast, heat, and initial radiation – and shelter, of substantial strength outside the areas of heaviest damage for those who must remain, and lighter shelter beyond the probable target area agaainst radioactive fallout, the lethal secondary effect of a thermon-nuclear ground explosion.

Funds to make an excellent start in survival planning were appropriated by Congress and advanced by FCDA to State and local gogvernments after individual project agreements have been approved by National Headquarters. Because survival planning is new, FCDA has proceeded cautiously. Most of the States and metropolitan areas that have initiated survival studies are working on the first phase of the plan – designing the study, inventorying existing community data, and making preliminary surveys aned analyses….

Survival planning can be done on a single city basis, or statewide, or for a whole cluster of critical target areas involving more than one State….

….Even in the development of proposals for Phase I Survival Plan studies, a large number of political subdivisions have had to face up to the fact that they can neither plan nor operate separately." (**FCDA**, *1955 Annual Report*, 1956, p. 2)

To assist States and their political subdivisions in developing survival plan studies, FCDA compiled and published *Survival Plan Manual*, M-27-1, and *Survival Plan Work Book*, M-27-2. Included in the two publications is a discussion of survey areas that should be covered in each study. These include (1) the location and anyalysis of population, including special assistance groups, institutional requirements, and a portion of the industrial jurisdiction coordination, the continuity of government, communications requirements, capabilities, service coordination, and alerting capabilities; (3) movement, including analysis of movement capabilities and capacities, transportation availability, and trafic control; (4) shelter availability and requirements; (5) reception and care, including assembly and reception area analysis, industrial population reception, institutional requirements and reception area, and a study of the return and/or resettlement analysis; (6) resources, which includes logtistical support and the utilization of Government resources with primary emphasis on the location of manpower, material, and facilities; (7) information and training, which includes romotional analysis and internal alerting capabilities." (**FCDA**,*1955 Annual Report*, p. 24)

Susceptibility: "Once the risk has been determined, the likelihood of an attack being successful can be assessed. In determining the susceptibility of an attack or "vulnerability to attack" it is assumed that the asset has been targeted, that the terrorists have the required weapon(s) and equipment, and that the attack will take place. The susceptibility then measures the probability that the attack would achieve its desired result given the constraints that are in place at the target, including physical constraints, operational constraints, and security measures.

"There are a number of methods that can be used to calculate or estimate susceptibility. These range from simple ratings of security capabilities to complex, simulation-based evaluations of detailed attack scenarios. The most appropriate method will depend on the type of asset and the goals of the risk assessment. In general, however, an appropriate assessment of susceptibility would include an evaluation of physical features, security capabilities, and response capabilities that serve to prevent an attack from being successful. These activities can also be categorized as those that serve to deny, detect, delay, or defend against the attack, and are addressed by other capabilities in the TCL." (**DHS**, *TCL*, 2007, p. 52)

Sustain: "Definition: to support, supply, and maintain the necessary level and duration of activity to achieve a given objective.

"Extended Definition: to maintain operations in the event of an attack, natural disaster, or other type of incident of national significance, either malicious or unintentional; and to provide, on a continual basis, the resources (people, funding, etc.) necessary to build, maintain and employ emergency response capabilities, as well as maintaining civil rights and liberties.

"Annotation: To physically maintain the integrity and operational capacity of the nation's critical systems, infrastructures, and their ability to function properly under any circumstances particularly during a period of recovery associated with and immediately following an adverse event or series of events caused by attack or natural disaster. Maintain effective support at critical or alternate locations in spite of natural or man-made disasters.

"Example: DHS will be a driving force to sustain and/or restore critical infrastructure." (**DHS**, *Lexicon: Terms and Definitions*, October 19, 2007, p. 25)

Sustainable: "A sustainable approach is one that meets the needs of the present without compromising the ability of future generations to meet their own needs." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 58)

Sustainable Communities: "Sustainable communities make more efficient use of their land. They emphasize open space planning where appropriate by promoting greenways, parks, and landscaping. The effective use of open space can prevent development from encroaching upon floodplains, active fault zones, and other hazard areas. Sustainable communities also take advantage of underutilized urban areas and encourage infill and "brownfield" development. Energy and resource conservation are high priorities. Emphasis is placed on public transit and creating mixed-use environments that are less dependent on automobiles. An essential characteristic of a sustainable community is its resilience to natural disasters." (**FEMA**, *Rebuilding For A More Sustainable Future: An Operational Framework*, Nov. 2000, p. 1-3)

Sustainable Communities: …where people and property are kept out of the way of natural hazards, where the inherently mitigating qualities of natural environmental systems are maintained, and where development is designed to be resilient in the face of natural forces…" (**Godschalk, Kaiser, and Berke** 1998, 86)

Sustainable Development: "In its broader sense, sustainability is defined as development that meets the needs of the present without compromising the ability of future generations to meet their own needs. In the context of emergency management, this meaning remains and it is linked to creating places that are less vulnerable to natural and technological hazards and that are resilient to those events. Sustainable hazard management has five components: environmental quality; quality of life; disaster resilience; economic vitality; and inter- and intra-generational equity. Reducing the risk from hazards, reducing losses from disasters and working toward sustainable communities go hand-in-hand" (**Britton** 1998, 1).

Sustainable Development: "…the reconciliation of society's development goals with Planet Earth's environmental limits over the long term." (**Carrido and Hays** 2001, 1)

Sustainable Development: A strategy for improving the quality of life while preserving the environmental potential for the future, of living off interest rather than consuming natural capital. Sustainable development mandates that the present generation must not narrow the choices of future generations but must strive to expand them by passing on an environment and an accumulation of resources that will allow its children to live at least as well as, and preferably better than, people today. Sustainable development is premised on living within the Earth's means. (**National Commission** 1993, 2)

Sustainable Development: "Sustainable development – which meets the needs of the present without compromising the ability of future generations to meet their own needs – is generally understood to require (1) economic growth, (2) protection of the environment, and (3) sustainable use of ecological systems. There is, however, a fourth criterion of equal importance: Sustainable development must be resilient with respect to the natural variability of the Earth and the solar system." (**NSTC** 1996, 4)

Sustainable Development: Development in the present that does not destroy the resources needed for future development (**Simeon Institute** 1998[120]).

Sustainable Development: Sustainable development is that which "meets the needs of the present without compromising the ability of future generations to meet their own needs." (**UN World Commission** 1987, 8)

Sustainable Planner: "The Sustainability Planner acts as a catalyst for sustainability and promotes a sustainable redevelopment component into the overall reconstruction effort. The Sustainability Planner evaluates opportunities for implementing sustainable redevelopment, presents these findings, and helps to build consensus on the appropriate level of effort to be pursued by FEMA, other Federal agencies (OFAs), state and local agencies, and nongovernmental organizations (NGOs)…. The goal of the sustainability initiative is to reduce the potential for disaster losses and to help communities realize opportunities to implement sustainable redevelopment during the recovery process. Although the goals and responsibilities of the Sustainability Planner are in many ways similar to FEMA's overall hazard mitigation goal, it is necessary to draw some distinctions. The Sustainability Planner focuses on developing comprehensive, long-term planning solutions and identifying opportunities to incorporate sustainable and livable community objectives. The mitigation specialist focuses on specific structural or nonstructural mitigation measures, such as buy-out or elevation of structures, National Flood Insurance Program (NFIP) compliance, building code enforcement, flood protection measures, and seismic and wind retrofit. The Sustainability Planner is more involved with comprehensive plans, zoning and subdivision regulations, and watershed and basin planning initiatives. The Sustainability Planner and the mitigation specialist are partners in building more disaster-resistant and sustainable communities, and their respective areas of emphasis complement each other." (**FEMA**, *Rebuilding For A More Sustainable Future: An Operational Framework*, November 1, 2000, p. 1-1, 1-2)

---

[120] Downloaded from web site address: http://www.cyberg8t.com/simeon/glossary.html (definitions from The Simeon Institute are obtained from "unattributed sources").

Sustainable Redevelopment: "The term "sustainable redevelopment" refers to applying the concepts and practices of sustainable development to the disaster recovery process. The post-disaster environment presents a unique opportunity to implement sustainability initiatives and to increase the quality of the built environment. If reconstruction is a major element of the recovery process, affected communities are presented with an opportunity to address such issues as the compatibility of development with the environment and natural hazards, the use of renewable resources, and improved community planning and physical design." (**FEMA**, *Rebuilding For A More Sustainable Future: An Operational Framework*, Nov. 2000, p. 1-3)

Sustainability: "Essentially, sustainability means that decisions made today should not reduce the options of future generations, but pass on to them a natural, economic, and social environment that provides a high quality of life." (**FEMA**, *Rebuilding For A More Sustainable Future: An Operational Framework*, November 1, 2000, p. 1-3)

Sustainability Initiative (FEMA): "The goal of the sustainability initiative is to reduce the potential for disaster losses and to help communities realize opportunities to implement sustainable redevelopment during the recovery process…. FEMA's sustainability initiative began formally in November 1998 when the Associate Director for Mitigation encouraged Regional Directors to set up a sustainable redevelopment function in DFOs (see Appendix I). The Associate Director proposed the establishment of a *sustainability desk* as part of the mitigation function in DFOs and/or Disaster Recovery Centers (DRCs). Two pilot efforts were undertaken in Ohio and West Virginia flood declarations (FEMA-DR-1227-OH and FEMA-DR-1229-WV)." (**FEMA**, *Rebuilding For A More Sustainable Future: An Operational Framework*, November 1, 2000, p. 1-2, 1-3)

SVA: Security Vulnerability Assessment. (**DHS**, *NIPP*, 2006, p. 102)

SwA: Software Assurance. (**DHS**, *Software Assurance: A Curriculum Guide*, Oct 2007, Foreword)

Switch on Wheels (SOW): Deployable IPAWS asset. (**FEMA**, *IPAWS Update*, 2007, slide 31)

SWOT Analysis: "SWOT analysis is a tool used in institutional assessments to capture and identify an organization's geographic and programmatic scope of action, its perceived effectiveness and level of acceptance and support by community members and local institutions. The analysis is broken down into Strengths, Weaknesses, Opportunities and Threats." (**ProVention Consortium**, *CRA Toolkit: Glossary of Terms*, 2006)

SWP: State Warning Point (NAWAS). (**FEMA,** *IPAWS Update*, 2007, slide 19)

Symptomology Card: "Symptomology cards are provided to each *actor* used in a *response*-focused exercise. Each card is unique, containing the signs and symptoms the actor will portray, as well as information for medical providers. The actors are instructed to keep these cards with them at all times during the exercise, and to not step out of character except in the event of a real emergency. At a minimum, symptomology cards should include: vital signs; symptoms; trauma injuries; acting instructions (e.g., disorientation, emotional distress); and special needs (e.g.,

language barriers, physical limitations)." (**FEMA**, *Homeland Security Exercise and Evaluation Program Glossary*, 2008)

System: "As stated in the National Preparedness Goal, 'a system is a combination of facilities, equipment, personnel, procedures, and communications integrated into a common organizational structure to achieve a mission or outcome'." (**DHS/ODP**, *State and Urban Area Homeland Security Strategy: Guidance on Aligning Strategies with the NPG*, 2005, p. 5)

System Assessment and Validation for Emergency Responders (SAVER): "The mission of the SAVER Program is to

- Provide impartial, practitioner relevant, and operationally oriented assessments and validations of emergency responder equipment.
- Provide information that enables decision makers and responders to better select, procure, use, and maintain emergency responder equipment. Assess and validate the performance of products within a system, as well as systems within systems. Provide information and feedback to the user community through a Web-based database." (DHS, SAVER, 2006, p. 1)

T3 AHIMT: Type 3 All-hazard Incident Management Team. (Zuber, *Type 3 All-hazard Incident Management Teams*, circa 2006-2008) [See "Incident Management Teams, Types"]

TA: Technical Assistance. (**DHS**, *G&T Information Bulletin No. 221*, October 2, 2006)

Tabletop Exercise (TTX): "A tabletop exercise involves key personnel discussing simulated scenarios in an informal setting. TTXs can be used to assess plans, policies, and procedures." (**FEMA**, *About HSEEP*, 2008)

Tabletop Exercise (TTX): "TTXs are intended to stimulate discussion of various issues regarding a hypothetical situation. They can be used to assess plans, policies, and procedures or to assess types of systems needed to guide the *prevention* of, *response* to, or *recovery* from a defined incident. During a TTX, senior staff, elected or appointed officials, or other key personnel meet in an informal setting to discuss simulated situations. TTXs are typically aimed at facilitating understanding of concepts, identifying strengths and shortfalls, and/or achieving a change in attitude. *Participants* are encouraged to discuss issues in depth and develop decisions through slow-paced problem-solving rather than the rapid, spontaneous decision-making that occurs under actual or simulated emergency conditions. TTXs can be breakout (i.e., groups split into functional areas) or plenary (i.e., one large group)." (**FEMA**, *Homeland Security Exercise and Evaluation Program Glossary*, 2008)

Tabletop Exercise (TTX): "An activity that involves key personnel discussing simulated scenarios in an informal setting. This type of exercise can be used to assess plans, policies, and procedures or to assess the systems needed to guide the prevention of, response to, and recovery from a defined incident. TTXs typically are aimed at facilitating understanding of concepts, identifying strengths and shortfalls, and achieving changes in attitude. Participants are encouraged to discuss issues in depth and develop decisions through slow-paced problem

solving, rather than the rapid, spontaneous decision making that occurs under actual or simulated emergency conditions." (**FEMA**, *NIMS Compliance Metrics Terms of Reference* (For FY 2007), Oct.23, 2006, pp. 3-4) [See "Exercise Types"]

Tabletop Exercise (TTX): "Test method that presents a limited simulation of a disruption, emergency or crisis scenario in a narrative format in which participants review and discuss, not perform, the policy, methods, procedures, coordination, and resource assignments associated with plan activation." (**ISO 22399**, *Societal Security*…, 2007, 7)

Tabun (GA): Tabun is a man-made chemical warfare agent classified as a nerve agent. Nerve agents are the most toxic and rapidly acting of the known chemical warfare agents. They are similar to pesticides (insect killers) called organophosphates in terms of how they work and what kinds of harmful effects they cause. However, nerve agents are much more potent than organophosphate pesticides…. Tabun is a clear, colorless, tasteless liquid with a faint fruity odor…can become a vapor if heated." (**CDC,** *Facts About Tabun*, March 7, 2003 Update)

TAC: Technical Assistance Contract/Contractors, FEMA Public Assistance Program.

Tactical: "Of or relating to small-scale actions serving a larger purpose; made or carried out with only a limited or immediate end in view." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, 40)

Tactical Direction (ICS): "Direction given by the Operations Section Chief which includes the tactics appropriate for the selected strategy, the selection and assignment of resources, tactics implementation, and resource monitoring for each operational period. (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 58)

Tactical Interoperable Communications Plan (TICP): "TICP serves as a planning tool to help sites exercise interoperable communications and to meet the Congressional mandate that grant recipients develop a tactical plan. TICP meets the requirements of Homeland Security Presidential Directive-5, *Management of Domestic Incidents*, and the DHS *National Incident Management System (NIMS)*." (**DHS/ODP**, *ODP TICP FAQs*, September 2005, p. 1)

Tactical Plan: "The term 'tactical plan' refers to the detailed development and identification of individual tasks, actions, and objectives tailored to specific situations and fact patterns at an operational level. Tactical planning is meant to support and achieve the objectives of the operations plan." (**White House**, *Annex I "National Planning" to HSPD-8*, December 2007, p. 2)

Tactical Planning: "Interagency Definition – The detailed development and identification of goals, priorities, objectives, and actions tailored to specific situations and fact patterns at an operational level. Tactical planning is meant to support and achieve the objectives of the operational plan." (**DHS**, *Interagency Planning Workshop*, November 29, 2007, slide #22)

Tactics: [ICS/NIMS] "Deploying and directing resources during an incident to accomplish the objectives designated by strategy." (**USCG**, *IM Handbook*, 2006, Glossary 25-23)

T&EPW: Training and Exercise Plan Workshops. (**FEMA**, *About HSEEP*, 2008)

TAG: Technical Assessment Group. (**DA**, *WMD-CST Operations*, Dec. 2007, Glossary-6)

TAG: The Adjutant Generals. (**FEMA**, *Statement of Glenn Cannon*, November 2007, p. 12)

TAI: Target Area of Interest. (**DA**, *WMD-CST Operations*, December 2007, Glossary-6)

Tailored Resourcing: "A critical aspect of federated planning is *tailored resourcing*. Tailored resourcing offers leaders a high degree of confidence that they can access essential capabilities without maintaining unnecessarily large, unaffordable fleets of equipment and people. Tailoring resources balances the tension between affordability and risk. By employing horizontal and vertical integration with tailored resourcing, leaders can identify opportunities for pooling resources and maximizing the potential utility of a given capability. Tailored resourcing ensures essential resources are available when, where, and as needed (i.e., time, space, and purpose). The Resource Management component of NIMS defines standardized mechanisms and establishes the resource management process to: identify requirements, order and acquire, mobilize, track and report, recover and demobilize, and inventory resources.

- *Availability.* Capability and resource availability fall into four categories: *Organic, Assigned, Earmarked*, and *Potential*.
    - *Organic Capabilities*. Organic capabilities are those that are an integral part of the basic structure of an organization, and are thus immediately responsive to the leadership of that organization. Organization leadership is responsible for developing, sustaining, and employing these organic capabilities.
    - *Assigned Capabilities*. Assigned capabilities are those that supporting entities have agreed to allocate to a supported organization for agreed upon purposes in agreed upon situations. Assignment to supported organizations is automatic once predetermined and pre-agreed situation thresholds are reached. Assignment agreements are regarded as binding.
    - *Earmarked Capabilities*. Earmarked capabilities are those that organizations *intend* to allocate to a supported organization at some future time and situation. Earmarked capabilities are allocated to support other organizations as the situation permits, but their commitment has not been prearranged. These capabilities are often formed into a pool of available resources, none of which have been allocated to a given organization. Resources and assistance available under the Emergency Management Assistance Compact (EMAC) are an example of earmarked capabilities.
    - *Potential Capabilities*. Potential capabilities are those that *might* be allocated to a supported organization in specified circumstances. Potential capabilities should not be regarded as a highly reliable resource. Their accessibility is determined on a case-by-case basis. (**FEMA**, *(Interim) Integrated Planning System (IPS) for Homeland Security (Draft Version 2.3)*, July 3, 2008, pp. 2-3. 3-4)

Tangible Elements of Emergency Operational Capability: "Those elements which can be measured or tallied, including items such as an operational EOC facility; documented emergency plans, including a CSP [Community Shelter Plan]; shelters; trained radiological monitors and

necessary equipment; coverage of outdoor warning devices; and trained fire and police auxiliaries…. Additional items include communications systems not only to local government agencies and other local sites, but also to State CD, and current operational equipment and supply inventory (e.g., location of bulldozers)." (**DCPA**, *On-Site Assistance* (MP 63), 1974, 5)

Target Capabilities List (TCL): "**…**defines 37 specific capabilities that communities, the private sector and all levels of government should possess in order to respond effectively to disasters." (**DHS**, *National Response Framework Comment Draft*, September 10, 2007, 68)

Target Capabilities List (TCL): "The Target Capabilities List describes the capabilities related to the four homeland security mission areas: Prevent, Protect, Respond, and Recover. It defines and provides the basis for assessing preparedness. It also establishes national guidance for preparing the Nation for major all-hazards events, such as those defined by the National Planning Scenarios. The current version of the TCL contains 37 core capabilities. A "Consensus of the Community" approach was used to develop the Target Capabilities List. Stakeholders from Federal, State, local, territorial, and tribal governments, the private sector, and nongovernmental organizations came together in four national workshops and capability working groups to define the capabilities. The Guidelines will serve as a framework to guide operational readiness planning, priority-setting, and program implementation at all levels of government. The Guidelines provide a call to action by all Americans as they consider their personal and shared responsibility to be part of *A Nation Prepared*. The Target Capabilities List provides guidance on building and maintaining capabilities that support the Guidelines" (**DHS,** *TCL*, Sep 2007, p. iii)

"…the TCL does not address capabilities for routine firefighting or law enforcement services, or seasonal flooding. Instead, the TCL addresses capabilities based preparedness to prevent, protect against, respond to, and recover from terrorism, very large-scale disasters, pandemic health emergencies, or other major incidents." (**DHS,** *TCL*, Sep 2007, p. 5)

"The Target Capabilities List should be viewed as a reference document or guide to preparedness. It should not serve as a prescription for program requirements or resource commitments. Most users will not use the TCL document directly and/or may only use one or a subset of capabilities that are relevant to them. They will use those portions of the TCL that are relevant to them or to their specific application through the TCL implementation tools." (**DHS**, *TCL*, 2007, p. 12)

"The TCL is designed to provide the nation with the network of flexible and adaptive capabilities across the country to prevent, protect against, respond to, and recover from incidents similar to those described in the National Planning Scenarios or other scenarios. Planners and officials at all levels will assess and determine their greatest risks within this framework to inform planning efforts and to establish priorities for addressing resource gaps, training, and exercises." (**DHS**, *TCL*, 2007, p. 13)

Target Capabilities List (TCL): "The TCL is a list of *capabilities* that provides guidance on the specific capabilities that Federal, State, tribal, and local entities are expected to develop and maintain to *prevent*, *protect* against, *respond* to, and *recover* from incidents of national

significance, including terrorism or natural disasters, in order to maintain the level of preparedness set forth in the *National Preparedness Goal*." (**FEMA**, *HSEEP Glossary*, 2008)

Target Capabilities List (TCL): "The Target Capabilities List (TCL)

- Defines preparedness
- Defines capabilities required to achieve the four homeland security missions: Prevent, Protect, Respond, and Recover
- Provides the basis for assessing preparedness and to improve decisions related to preparedness investments and strategies
- Defines capabilities and national targets to prepare the Nation for major all- hazards events such as those defined by the National Planning Scenarios
- Assumes shared responsibility for preparedness across local, tribal, State, and Federal agencies, nongovernmental organizations, the private sector, and citizens." (**FEMA**, *National Preparedness System: Current Prototype & Proposed Implementation Approach*, August 2, 2007, slide 9)

Target Capabilities List (TCL): "A component of the National Preparedness Goal from HSPD-8 which describes and sets targets for the capabilities required to achieve the four homeland security mission areas: Prevent, Protect, Respond, and Recover. The List defines and provides the basis for assessing preparedness. It also establishes national targets for the capabilities to prepare the Nation for major all-hazards events, such as those defined by the National Planning Scenarios. The current version of the TCL contains 37 core capabilities." (**Homeland Security Council,** *National Continuity Policy Implementation Plan*, Aug 2007, 67)

Target Capabilities List Performance Measures: "Performance measures are quantitative or qualitative levels against which achievement of a task or capability outcome can be assessed. They describe how much, how well, or how quickly an action should be performed and are typically expressed in ways that can be observed during an exercise or real event. *The measures and metrics are not standards. They serve as guides and evaluation tools for planning, training, and exercise activities.*" (**DHS**, *TCL*, 2007, p. 8)

Target Capabilities List Phase I Core Capabilities (37): (**DHS,** *TCL*, Sep 2007, p. viii)

Common Capabilities
- Planning
- Communications
- Community Preparedness and Participation
- Risk Management
- Intelligence and Information Sharing and Dissemination

Prevent Mission Capabilities
- Information Gathering and Recognition of Indicators and Warning
- Intelligence Analysis and Production
- Counter-Terror Investigation and Law Enforcement
- CBRNE Detection

Protect Mission Capabilities
- Critical Infrastructure Protection
- Food and Agriculture Safety and Defense
- Epidemiological Surveillance and Investigation
- Laboratory Testing

Respond Mission Capabilities
- On-Site Incident Management
- Emergency Operations Center

Management
Critical Resource Logistics and Distribution
Volunteer Management and Donations
Responder Safety and Health
Emergency Public Safety and Security
Animal Disease Emergency Support
Environmental Health
Explosive Device Response Operations
Fire Incident Response Support
WMD and Hazardous Materials Response and Decontamination
Citizen Evacuation and Shelter-in-Place
Isolation and Quarantine
Search and Rescue (Land-Based)
Emergency Public Information and Warning
Emergency Triage and Pre-Hospital Treatment
Medical Surge
Medical Supplies Management and Distribution
Mass Prophylaxis
Mass Care (Sheltering, Feeding and Related Services)
Fatality Management

Recover Mission Capabilities

Structural Damage Assessment
Restoration of Lifelines
Economic and Community Recovery

(**DHS**, *Target Capabilities List*, September 2007, p. vii)

Target Capability List (TCL) Implementation Project: "The Department of Homeland Security (DHS) Federal Emergency Management Agency (FEMA) is underway with an initiative called the Target Capability List (TCL) Implementation Project. The Project is the next step in the Nation's effort to develop, assess, and strengthen prevention, protection, response, and recovery capabilities.

The initial phase of the Project involves developing a series of target capability frameworks to help States and local jurisdictions determine whether they need a given capability to be prepared, and if so, at what level. The **target capability frameworks** build upon the preparedness guidance found in TCL v2.0 (released in September 2007) and each consists of a user-friendly matrix of three charts that define: performance classes (for grouping jurisdictions according to shared risk factors), performance objectives (for determining the capability level for each performance class), and resource requirements (for identifying needs related to plans, personnel, training, equipment, and exercises).

DHS/FEMA is working with stakeholders through a series of Technical Working Group (TWG) sessions to develop the **first six target capability frameworks**. These include Animal Health, Emergency Operations Center Management, Intelligence, Mass Transit Protection, On-Site Incident Management, and WMD/HazMat Rescue and Decontamination.

The TWG sessions are being held this summer in FEMA regional locations and all sessions are comprised of subject matter experts, practitioners, and national associations in the emergency management and homeland security communities to ensure collaboration across the Federal, State, and local levels. Once the TWG sessions are complete, a National Review will be conducted to enable the larger homeland security community to review the target capability frameworks and provide input before a proposed national release. Additional target capability frameworks will be developed in subsequent years, culminating in TCL v3.0 in 2010.

Working with the stakeholder community, DHS/FEMA is confident that this initiative will enhance our Nation's ability to assess preparedness against a national benchmark, leading to a clearer picture of what jurisdictions need to do – individually and collectively – to prepare for acts of terrorism and major disasters. The TCL Implementation Project represents the next step in the Nation's effort to become, "A Nation Prepared." For additional information, please contact the TCL Implementation Project Team at TCL@dhs.gov" (FEMA, TCL Implementation Project, Content for Listserve Distribution, June 13, 2008)

Target Capability Preparedness Levels: "Target preparedness levels represent suggested levels of capability that may be needed to prevent, protect against, respond to, and recover from major events that demand a multi-level, multi-jurisdictional, multi-disciplinary response. Stakeholder working groups suggested Target Capability preparedness levels based on an analysis of the circumstances and consequences described in the National Planning Scenarios and the planning factors." (**DHS**, *TCL*, 2007, p. 9)

National Preparedness Levels for Capabilities

- The Target Capability preparedness levels estimate what may be needed should major events exceed the capacity of any single jurisdiction.
- Responsibility for meeting Target Capability preparedness levels can be shared across government and non-government entities.
- Many of the resource estimates are not standing requirements – they would be assembled when and where they are needed.
- Assessments of current capabilities against target levels can provide an indication of relative preparedness. (**DHS**, *TCL*, 2007, p. 10)

Targeted Infrastructure Protection Program (TIPP): "The Targeted Infrastructure Protection Program provides funding to public and private sector owners and operators of transit infrastructure to improve the Nation's ability to prevent, protect against, respond to, and recover from terrorist attacks." (**ExpectMore.gov**, *FEMA: TIPP*),

TASC: Transformation and System Consolidation. (**DHS,** *IPG FY 2011-2015 Draft*, p. 19)

Task: "A discrete action that enables a function to be accomplished by individuals or organizations." (**Homeland Security Institute**, *HS Strategic Planning MAA*, March 2007, p. 63)

Tasks: "Tasks are specific, discrete actions that individuals or groups must complete or discuss during an exercise to successfully carry out an activity. Successful execution of performance measures and tasks, either sequentially or in parallel, is the foundation for activities, which are, in turn, the *foundation* of *capabilities*." (**FEMA**, *HSEEP Glossary*, 2008)

Task Force: "Any combination of resources assembled to support a specific mission or operational need. All resource elements within a Task Force must have common communications and a designated leader." (**DHS**, *NIMS*, 2004, p. 137)

Task Force: [ICS] "A group of resources with common communications and a leader assembled for a specific mission." (**USCG**, *IM Handbook*, 2006, Glossary 25-23)

Task Force for Emergency Readiness (TFER): "Federal, regional, State, and local plans must be integrated and synchronized to give us a truly *national* response to a future catastrophic incident. To pursue this end, DoD has partnered with DHS to develop the Task Force for Emergency Readiness (or "TFER") initiative. The TFER is under the direct leadership of the Governor's state emergency management structure and teams State civilian planners, National Guard planners, DHS Federal Preparedness Coordinators, and DoD Emergency Preparedness Liaison Officers to:

- Produce State plans tailored to the unique strengths and vulnerabilities of each individual State; and
- Facilitate the integration and synchronization of local, State, Regional, Federal, and private sector incident planning.

The TFER initiative will enable merging bottom-up local/State planning with the Federal top-down approach to integrate the Federal-State planning process, thereby implementing the coordination envisioned by the IPS and achieving a unity of effort that mirrors our nation's principles of self reliance and the federal model of government. In short, each state's TFER will provide a focal point for catastrophic response planning, integrating all relevant capabilities – military and civilian – found within the public and private sectors.

The strength of the TFER is in the fact that it will be a scalable, flexible organization whose responsibilities can be uniquely tailored to fit each State's needs. Typical task force functions might include:

- Completing operational plans for identified catastrophic scenarios;
- Promoting State deliberate planning and coordination;
- Assisting in ensuring local planning capability requirements are addressed;
- Offering a conduit to Federal response planning and capabilities (e.g. FEMA, DoD);
- Aiding State-to-State coordination for regional incidents (e.g., a hurricane);
- Supporting State crisis action planning;
- Implementing exercise lessons learned to improve subsequent planning;
- Informing State emergency manager dialogue and decision-making;
- Supporting multi-level policy coordination; and
- Informing logical, fiscally responsible decisions to address capability or capacity shortfalls.

Initially, the TFER initiative will be tested in select pilot states with the intent of expanding the concept to all States and territories in the United States." (**DOD**, Paul McHale Senate Testimony, June 26, 2008, pp. 20-24)

TAV: Total Asset Visibility.

TCL: Target Capabilities List. (**DHS,** *NIPP*, 2006, p. 102)

TCU: Tribal Colleges and Universities.

TDRM: Total Disaster Risk Management.

T&EPW: Training & Exercise Plan Workshop. (**FEMA,** IS-120 A, *Intro to Ex.,* 23Jan08, 17)

Tearline Report: "Contains information that has been declassified or information that is at a reduced/downgraded Classification level as compared to the original report from which the Tearline report is generated/produced. A Tearline report is produced by redacting, paraphrasing, restating or generating in a new form the classified information contained in the original report in such a manner that the previously classified information is now either declassified or is at a reduced/downgraded Classification level." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, 40)

Technical Assistance (TA) (Object Class 2507): A type of Mission Assignment defined as "technical expertise provided by the Federal government to State and/or local jurisdictions when the State has the resources, but lacks the knowledge and/or skills needed to perform the work related to the disaster or emergency. TA is 100-percent federally funded but must be requested and approved by the State.

Example: A mission assignment issued to the U.S. Army Corps of Engineers to provide TA to affected counties in the writing of debris contracts." (**FEMA**, *Mission Assignment*, 2007, p.10)

Technical Assistance Contractors: "FEMA awards nationwide, stand-by technical assistance contracts (TAC) to meet PA [Public Assistance] program needs that typically cannot be met by FEMA staff. PA TAC employees are specialists that provide services such as assessing and estimating disaster damages to complex facilities, and providing insurance adjustment services and historical and environmental reviews. For disasters occurring in FYs 2004, 2005, and 2006, FEMA spent $228.3 million, $1.4 billion, and $94.9 million, through November 2006, respectively, for PA TACs. A contracting officer technical representative located at FEMA Headquarters oversees the master contracts and task monitors at field and regional offices provide site monitoring for TAC employees." (**DHS OIG**, *Fiscal Year 2008 Annual Performance Plan*, 2007, p. 35)

Technical Attack: "An attack that can be perpetrated by circumventing or nullifying hardware or software protection mechanisms, or exploiting hardware or software vulnerabilities, rather than physical destruction or by subverting system personnel or other users." (**DoD**, *CAAP*, 1998)

Technical Canvasses: "Technical canvasses involve canvasses for electronic devices in order to identify witnesses and sources of information. Technical canvasses may involve electronic image capture devices (still, video, CCTV), electronic banking transaction devices (Automated Teller Machine), electronic financial transaction devices (credit card, debit card, social services card, stored value card), electronic travel transaction devices(Metro Card, EZ Pass, airline ticket, railroad ticket), electronic access/egress control devices (identification card reader, proximity card reader, biometric card reader), cell sites, pay phones, internet cafes." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, 40)

Technical Specialist (ICS): "Personnel with special skills that can be used anywhere within the ICS organization. No minimum qualifications are prescribed, as technical specialists normally perform the same duties during an incident that they perform in their everyday jobs, and they are typically certified in their fields or professions." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, 40)

Technological Accident: "An unexpected incident, failure or loss occurring through the application of practical or mechanical sciences to industry or commerce that poses potential harm to persons, property or the environment." (**European Environment Agency**, *EEA Multilingual Environmental Glossary*, 2007)

TEI: Training and Exercise Integration. (FEMA/NPD/NIC, slide 2)

TEI/TO: Training and Exercise Integration Secretariat, Training Operations, National Preparedness Directorate, FEMA, 2007.

Temporary Housing: "*Temporary Housing* facilities are intended to provide living accommodations for an extended period of time, to include single- and multi-family homes, apartments and manufactured homes." (**FEMA**, *FEMA Recovery Strategy*, August 2006)

TEP: Training and Exercise Plan. (**FEMA**, *National Exercise Division, Homeland Security Exercise and Evaluation Program, Quarterly Newsletter*, Spring 2008, p. 2)

Tephra: "Material ejected from a volcano, with the exception of lava." (**UNDHA**, *DM Glossary*, 1992, 73)

TEPWs: Training and Exercise Plan Workshops. (**FEMA**, *Homeland Security Exercise and Evaluation Program HSEEP Newsletter* (Winter 2008, Issue 7), February 5, 2008, p. 2)

Terminology: "The use of precisely defined terms is critical in any profession....It is not a question of semantics, as some would say, because the terms should be used and understood properly. This does not mean that terms or their meanings should be defined dogmatically; there is always a need to create new terms or modify existing ones. However, great care should be shown in changing meanings… Most terms used over many decades and even centuries are still valid. Some need to be modified because of changing practices but that does not mean drastically altering the meanings of existing and well-defined terms." (**Vego**, "The Problem of Common Terminology," *Joint Force Quarterly*, Vol. 43, 2006, p. 49)

Terrorism: "…premeditated, politically motivated violence perpetrated against noncombatant targets by subnational groups or clandestine agents." (**Department of State)**

Terrorism: "Definition: premeditated threat or act of violence, against noncombatant persons, property, environmental, or economic targets, to induce fear or to intimidate, coerce or affect a government, the civilian population, or any segment thereof, in furtherance of political, social, ideological, or religious objectives.

"Extended definition: usually conducted by an organization with an identifiable chain of command or conspiratorial cell structure, whose members are considered a sub-national or non-state entity.

"Example: Protecting the United States against acts of terrorism is the Department of Homeland Security's primary focus." (**DHS**, *Lexicon: Terms and Definitions*, October 19, 2007, p. 26)

Terrorism: "Any activity that (1) involves an act that is (a) dangerous to human life or potentially destructive of critical infrastructure or key resources, and (b) a violation of the criminal laws of the United States or of any State or other subdivision of the United States; and (2) appears to be intended to (a) intimidate or coerce a civilian population, (b) influence the policy of a government by intimidation or coercion, or (c) affect the conduct of a government by mass destruction, assignation, or kidnapping." (**DHS**, *NIPP*, 2006, p. 105)

Terrorism: "…the unlawful use of force or violence against persons or property to intimidate or coerce a Government, the civilian population, or any segment thereof, in furtherance of political or social objectives." (**FBI**)

Terrorism: "The calculated use of unlawful violence or threat of unlawful violence to inculcate fear; intended to coerce or to intimidate governments or societies in the pursuit of goals that are generally political, religious, or ideological." (**FEMA**, *Disaster Dictionary* 2001, 120; citing DoD Joint Pub 1-102)

Terrorism: "The unlawful use of force or violence against persons or property to intimidate or coerce a government, the civilian population, or any segment thereof, in furtherance of political or social objectives. Domestic terrorism involves groups or individuals who are based and operate entirely within the United States and U.S. territories without foreign direction and whose acts are directed at elements of the U.S. government or population." (**FEMA**, *Guide for All-Hazard Emergency Operations…*, 2001, p. 6-G-F-3)

Terrorism: A violent act to attain specific goals. Distinguished from other types of criminal acts by:

Political aims and motives.

Violent or acts that threaten violence.

Far-reaching psychological repercussions beyond immediate victim or target.

Conducted by organization with identifiable chain of command or structure.

Perpetrated by sub-national group or non-state entity. (**Hoffman**, 1998)

Terrorism: "…the calculated use of unexpected, shocking, and unlawful violence against noncombatants (including, in addition to civilians, off-duty military and security personnel in peaceful situations) and other symbolic targets perpetrated by a clandestine member(s) of a

subnational group or a clandestine agent(s) for the psychological purpose of publicizing a political or religious cause and/or intimidating or coercing a government(s) or civilian population into accepting demands on behalf of the cause." (**Library of Congress** 1999, 12)

Terrorism: Simple definition: Violence or threatened violence intended to produce fear or change.

Legal definition: Criminal violence violating legal codes and punishable by the state.

State-sponsored terrorism: National or other groups used to attack other interests.

State terrorism: Power of the government used to repress its people to the point of submission. (**Rosie,** 1987)

Terrorism: "The word *terrorism* emerged during the French revolution of the late 1700s to describe efforts by the revolutionary government to impose its will through widespread violence; the *Academie Francaise* soon defined terrorism as a 'system or rule of terror.'" (**Sauter and Carafano** 2005, 64)

"…*terrorism* usually includes most or all of the following central elements:

- Conducted by subnational groups
- Targeted at random noncombatant victims
- Directed at one set of victims in part to create fear among a larger audience
- Aimed at coercing governments or populations
- Planned to get publicity
- Motivated by political, ideological, or religious beliefs
- Based on criminal actions (actions that would also violate the rules of war)." (p. 66)

Terrorism: "Terrorism, or the threat of terrorism, involves acts of violence used in peace, conflict or war and are acts that shock the senses of reasonable people." (**Simonsen**, 2004)

Terrorism: "Terrorism is a special type of violence. While terrorism often seeks legitimacy as political action, terrorism is a criminal offense under nearly every national or international legal code. Although terrorism has not yet caused the physical devastation and large number of casualties normally associated with traditional warfare, terrorism can produce a significant adverse psychological impact and present a threat greater than a simple compilation of the number of people killed or the quantity of materiel destroyed." (**US Army TRADOC**, 2007, p. 3) "The calculated use of violence or threat of violence to inculcate fear; intended to coerce or to intimidate governments or societies in the pursuit of goals that are generally political, religious, or ideological." (**US Army TRADOC**, 2007, p. 151)

Terrorism: "Any activity that: (1) involves an act that (a) is dangerous to human life or potentially destructive of critical infrastructure or key resources and (b) is a violation of the criminal laws of the United States or of any State or other subdivision of the United States; and

(2) appears to be intended (a) to intimidate or coerce a civilian population, (b) to influence the policy of a government by intimidation or coercion, or (c) to affect the conduct of a government by mass destruction, assassination, or kidnapping." (**USCG**, *IM Handbook* 2006 Glossary 25-23)

Terrorism: "The *National Strategy for Homeland Security* characterizes terrorism as any premeditated, unlawful act dangerous to human life or public welfare that is intended to intimidate or coerce civilian populations or governments. This description captures the core concepts shared by the various definitions of terrorism contained in the U.S. Code, each crafted to achieve a legal standard of specificity and clarity. This description covers kidnappings; hijackings; shootings; conventional bombings; attacks involving chemical, biological, radiological, or nuclear weapons; cyber attacks; and any number of other forms of malicious violence. Terrorists can be U.S. citizens or foreigners, acting in concert with others, on their own, or on behalf of a hostile state." (**White House**, *National Strategy For HS*, 2002, p. 2)

Terrorism Early Warning (TEW): "Fusion is a cyclical process that includes the following stages:

- Management/Governance
- Planning and Requirements
- Development
- Collection
- Analysis
- Dissemination, Tasking, and
- Archiving
- Re-evaluation
- Modification of Requirements

The TEW encompasses the above described fusion process and builds toward a "common operating picture" for a national network of sharing terrorist threat- and incidentrelated information and intelligence. The TEW, as reflected within this Resource Book, supports and implements the recommended standards, baseline processes, and road maps for enhanced law enforcement, public safety and homeland security information/intelligence sharing activities previously described in the fusion process, and that have been produced through the auspices of the U.S. Department of Justice (DOJ), Bureau of Justice Affairs (BJA), GLOBAL initiative. This includes the following documents:

• The *National Criminal Intelligence Sharing Plan* (NCISP), updated as of June 2005.
• Homeland Security Advisory Council (HSAC), *Intelligence and Information Sharing Initiative*, December 2004.
• HSAC, *Intelligence and Information Sharing Initiative: Homeland Security Intelligence and Information Fusion*, April 28, 2005.

Terrorism Information: "**(**d) the term "terrorism information" means all information, whether collected, produced, or distributed by intelligence, law enforcement, military, homeland security, or other United States Government activities, relating to (i) the existence, organization, capabilities, plans, intentions, vulnerabilities, means of finance or material support, or activities of foreign or international terrorist groups or individuals, or of domestic groups or individuals

involved in transnational terrorism; (ii) threats posed by such groups or individuals to the United States, United States persons, or United States interests, or to those of other nations; (iii) communications of or by such groups or individuals; or (iv) information relating to groups or individuals reasonably believed to be assisting or associated with such groups or individuals." (**White House**, *EO 13356*, August 27, 2004)

Terrorism Liaison Officer (TLO) Program: "One program that I support is the Terrorism Liaison Officer or TLO. TLO programs can be found in many law enforcement agencies across the nation. I appreciate the fact that the TLO initiatives are "home grown," resulting from the desire of individual agencies to be engaged in the war on terrorism. I also appreciate the roles that you, as intelligence analysts, play in adding value to information gathered by first responders. We at DHS Intelligence and Analysis lead the ITACG that I mentioned before. It incorporates the skills and unique insights of law professionals into the intelligence cycle." (**DHS**, *Keynote Address by Under Secretary Charles Allen at the 2008 IALEIA/LEIU Conference*, April 8, 2008)

Terrorism Liaison Officer Program (DHS & DOJ): "Both the Intelligence Liaison Officers Program and Terrorism Liaison Program demonstrate the effectiveness of this relationship [DHS & DOJ]. Each program is designed to ensure the information contained within fusion centers reaches the street level police officer and firefighter, and just as important, provides them with a pathway for providing information back to the center and through it to the federal government. These programs are administered jointly by, and the training conducted with participation of, grant and technical experts from both Departments." (**DHS,** *Testimony of Principal Deputy Under Secretary for Intelligence and Analysis Jack Tomarchio Before the Senate Committee on Homeland Security and Governmental Affairs Ad Hoc Subcommittee on State, Local and Private Sector Preparedness and Integration, "Focus on Fusion Centers: A Progress Report,"* 17Apr08)

Terrorism Liaison Officers (TLO): "Arizona's Phoenix New Times (7/12, Dickerson) writes, "According to a local source and Department of Justice documents now available online, counter-terrorism officials are training civilians to keep an eye on you. And few states are training Big Brother's informants faster than Arizona. These unpaid spies are called TLOs (Terrorism Liaison Officers). They're taught to report anything from a suspicious tourist video-recording a bridge to the theft of potential bomb-making materials. Even suspicious note-taking warrants their scrutiny. Most TLOs already work as firefighters or federal employees, though our state Department of Homeland Security source says some civilians have joined rank in the Phoenix area. Though the fact that TLOs are so prominently in our midst was news to us, the program has been in progress long enough here to train 250 of the government snoops. This according to our source, a TLO himself." (**DHS News Briefing**, *Bulletin News*, July 12, 2008)

Terrorism Preparedness: "The term 'terrorism preparedness' means any activity designed to improve the ability to prevent, prepare for, respond to, mitigate against, or recover from threatened or actual terrorist attacks." (**US Congress**, *Implementing the 9/11 Commission Recommendations Act of 2007*, August 7, 2007, p. 10)

Terrorism Prevention: "Terrorism prevention consists of those activities that serve to detect and disrupt terrorist threats or actions against the U.S. and its interests, and decrease the

likelihood that a specific terrorist threat or plan will be culminated or executed. It is these activities that have been identified and consolidated to make up the prevention core capabilities." (**DHS**, *HSEEP*, Vol. V, December 2005 Draft, p. 8)

Terrorism Prevention Exercise Program (TPEP) "The Terrorism Prevention Exercise Program (TPEP) is dedicated to providing participants at the Federal, State, tribal, and local levels the tools needed to test and improve their ability to prevent terrorism. Exercises are intended to produce comprehensive and valuable analyses of prevention capabilities in order to ultimately enhance the Nation's ability to prevent terrorism by preparing information-sharing environment partners at the State and local levels to fuse local and National information and intelligence and produce predictive analysis." (**DHS**, *HSEEP, Volume V…,* Dec 2005, p. 2)

Terrorism Prevention Exercise Program (TPEP): TPEP is dedicated to providing participants at the Federal, State, tribal, and local levels the tools needed to demonstrate, evaluate, and improve the capability to prevent terrorism through information- and intelligence-based exercises. TPEP uses *HSEEP* methodology, but focuses on pre-incident operations." (**FEMA**, *HSEEP Glossary*, 2008)

Terrorism Risk Assessment: "TERRORISM RISK ASSESSMENT--With respect to analyzing and assessing the risk of acts of terrorism, the Administrator shall consider—(1) the variables of threat, vulnerability, and consequences related to population (including transient commuting and tourist populations), areas of high population density, critical infrastructure, coastline, and international borders; and (2) the most current risk assessment available from the Chief Intelligence Officer of the Department of the threats of terrorism against the United States." (**Post-Katrina Emergency Management Reform Act of 2006**, p. 1426)

Terrorism Risk Insurance Act (TRIA): "TRIA and TRIEA established the federal government as the backstop reinsurer of certain types of terrorism risk, for most commercial lines carriers, and for certain types of losses: principally, injury to or death of employees, damage to commercial properties and operations due to acts of terrorism committed by foreign nationals. The federal insurance "kicks in" only above specific "retentions" (or deductibles), and even then pays most, but not all, of the claims above that level, up to a designated ceiling. The federal government does not charge for providing this reinsurance beforehand, as a typical private insurer would do, but TRIA and TRIEA do require insurers to repay at least some of the government's claims payouts over an extended period, subject to the discretion of the Treasury Secretary, whose department administers the program." (**FSR**, *Nation Unprepared*, 2007, 60)

Terrorism Risk Insurance Act (TRIA): Congress passed "the Terrorism Risk Insurance Act (TRIA) in November 2002. Since then, TRIA has been reauthorized twice. The latest reauthorization, passed at the end of 2007, extends the law to 2014. TRIA provides a federal backstop for commercial insurance losses from terrorist acts, making it easier for insurers to calculate their maximum losses for such a catastrophe and thus to underwrite the coverage…" (**Insurance Information Institute**, *Catastrophes*, Jan 2007)

Terrorism versus All-Hazards: "In Section 2 we observed that virtually all top level guidance for critical infrastructure planning focuses on threats from terrorist attacks. Specifically, HSPD-7 defines as its purpose:

> 'This directive establishes a national policy for Federal departments and agencies to identify and prioritize United States critical infrastructure and key resources and to protect them from terrorist attacks.'

"Although terrorist threats are obviously acknowledged, this guidance establishes for critical infrastructure mission owners a planning environment that is not aligned with the broader homeland security mission objectives, which incorporate the all-hazards perspective. In particular, HSPD-8 requires "all-hazards preparedness" to connote "preparedness for domestic terrorist attacks, major disasters, and other emergencies." Given that HSPD-8 establishes policies to strengthen our ability to prevent as well as to respond to all hazards, and that critical infrastructures play a vital role in all related activities, the CITF believes that critical infrastructure planning must also incorporate the all-hazards perspective. The CITF also believes that HSPD7 should be modified to establish a more consistent framework of policy guidance." (**HSAC**, *Report of the Critical Infrastructure Task Force*, January 2006, p. 6)

Terrorist: Under U.S. law and sentencing guidelines a terrorist is someone who "appears to be intended to intimidate or coerce a civilian population." (**US Code,** Title 18, Part I, Chapter 113b, Section 2331**)**

Terrorist Objectives: "Make no mistake -- the terrorists seek to destroy not only our lives, but our entire way of life… President Bush captured the essence of what motivates these outstanding men and women [of DHS] when he said, "The terrorists cannot shake our will. America and its allies will act decisively, because we know that the future of civilization is at stake…'" (**DHS**, *Secretary Michael Chertoff U.S. Department of Homeland Security Second Stage Review Remarks*, DHS, July 13, 2005)

Terrorist Screening Center (TSC) FBI: "The Terrorist Screening Center (TSC) was established by Homeland Security Presidential Directive 6 which directed that a center be established to consolidate the government's approach to terrorism screening and to provide for the appropriate and lawful use of terrorist information in screening processes. The TSC began operations on December 1, 2003.
Vision: To establish a dynamic global screening network to support the detection of terrorists.
Mission: Consolidate and coordinate the Government's approach to terrorism screening and facilitate information sharing to protect the Nation and the international community.
What We Do
1. Maintain the U.S. Government's Consolidated Terrorist Watchlist. The Terrorist Screening Center (TSC) maintains a consolidated database of the names and other identifying information for all known or suspected terrorists, known as the Terrorist Screening Database (TSDB). Pursuant to HSPD-6, a known or suspected terrorist is an individual "known or appropriately suspected to be or have been engaged in conduct constituting, in preparation for, in aid of, or related to terrorism." The TSDB contains information on known or suspected terrorists only; it does not contain information on persons who have no nexus to terrorism.

2. Support Agencies that Screen for Terrorists. The TSC supports federal, state, local, territorial, and tribal law enforcement agencies and some foreign governments that conduct terrorist screening by making the TSDB information available to them for screening purposes. TSC's 24-hour call center also supports agencies' terrorist screening processes by determining whether the person being screened is an identity match to the TSDB. TSC supports terrorism screening at agencies like the State Department (passport and visa applications), the Bureau of Customs and Border Protection (border crossings and international flights), the Bureau of Citizenship and Immigration Services (immigration and citizenship applications), and the Transportation Security Administration (domestic flights). The TSC has also made Terrorist Identities Information accessible through the National Crime Information Center (NCIC) system to law enforcement officers, including 870,000 state and local officers nationwide, adding those resources to the fight against terrorism.
Why We Do It: It's a very simple answer: to protect against future terrorist attacks in the United States and its allies." (**FBI**, *Counterterrorism – Terrorist Screening Center*)

Test, Training, and Exercise (TT&E): "Measures to ensure that an agency's continuity plan is capable of supporting the continued execution of the agency's essential functions throughout the duration of a continuity situation." (**DHS**, *FCD 1*, Nov. 2007, P-9)

Testing: "Activity in which some part(s) of the operational continuity plan(s) is/are followed to ensure that the plan(s) contain(s) the appropriate information and produces the desired result." (**ISO 22399**, *Societal Security*…, 2007, 7)

TEW: Terrorism Early Warning.

Texas Landowners' Rights Association v. Harris (1978): "Regarding individual constitutional rights, a landmark decision in the realm of mitigating property damage in flood-prone areas was a 1978 federal district court ruling (sustained on appeal to the Supreme Court) upholding the federal flood insurance program. In *Texas Landowners' Rights Association v. Harris*, plaintiff landowners sued the federal agency administering the national flood insurance program, because the program required that flood-prone communities engage in flood plain land use management for the purpose of mitigating property damage, and denied federal financial assistance in property acquisition (e.g., FHA loans) for the purchase of property in flood-prone areas in which such land use planning did not exist. Since the denial of federally assured financing for property purchases in flood-prone communities not engaged in flood plain management had the effect of reducing property values in these communities, landowners sued the United States on the theory that their lost property value constituted a taking of their property by the federal government. In rejecting this argument, the court thereby upheld government authority to require community and individual disaster mitigation measures as a condition for federal financial assistance in property acquisition and restoration subsequent to a flood-related disaster." (**Burton**, "The Constitutional Roots of All-Hazards Policy, Management, and Law," 2008, p. 9)

Texas Windstorm Insurance Association: "The Texas Windstorm Insurance Association (Texas Windpool) offers windstorm and hail coverage for residential and commercial properties in 14 coastal counties and parts of Harris County (but not Houston). About 25 percent of the state's population lives along the coast. The membership of the Texas Windpool includes every

property insurer licensed to write property insurance in the state. Each company's percentage of participation is based on their statewide sales." (**GAO**, Natural Disasters: Public Policy Options, Nov 2007, p. 67; see, also, pp. 68-69)

TF: Task Force.

TFAH: Trust for America's Health.

TH: Transitional Housing.

The Framework: National Response Framework. At: http://www.fema.gov/NRF

The Infrastructure Security Partnership (TISP): "The Infrastructure Security Partnership (TISP) was established following the tragic events of September 11, 2001, as a national forum for public and private-sector organizations to collaborate on issues regarding the resilience of the nation's critical infrastructure against the adverse impacts of natural and man-made disasters. TISP members—who represent the design, construction, operation, and maintenance communities; local, state, and federal agencies; academe; and other organizations concerned about disaster preparedness, response, and recovery—work together to identify and develop cost-effective solutions by leveraging their collective resources, experience, technical expertise, research and development capabilities, and knowledge of public policy regarding natural and man-made disasters. Since its establishment, membership has grown to more than 100 organizations representing more than 1.5 million individuals and firms." (**TISP**, *Regional Disaster Resilience: A Guide for Developing an Action Plan*, June 2006, p. 1)

Therapeutic Community Hypothesis: "Fritz has postulated from an examination of many previous disaster studies the existence of certain positive or therapeutic effects of community-size disasters. For example, in a paper presented before the Southern Sociological Society in April of 1961, he said the following about the final stage in the development of what he calls the community of sufferers.

> "The structure and forms of interaction adopted by the community of sufferers during this stage can be shown to be both individually and socially therapeutic in nature and effect, in the sense that they:
>
> 1. Resolve and ameliorate pre-existing personal and social conflicts that might endanger the present and future continuity of social life;
>
> 2. Attenuate or prevent the usual disorganizing individual and small group responses to danger, trauma, loss and privation;
>
> 3. Reduce or prevent self-aggressive and anti-social behavior arising from the losses and privations imposed by the disaster; and
>
> 4. Re-motivate the actors in the system to devote their energies to socially reconstructive and regenerative tasks." (Fritz, "The Therapeutic Aspects of Community Disaster, 1961)

The evidence available from the Hurricane Audrey [1958] study does not support Fritz's hypothesis in most of its particulars. For example, the description of the rehabilitation process associated with Audrey and other observations point instead to the following facts.

> 1. While it may have been true that certain interpersonal conflicts which had loomed large to people before the storm were temporarily reduced, it is equally if not more true that new conflicts arose which were more severe in consequence for the social system than those that had existed before. Furthermore, old community and political loyalties seemed to form the axis around which new and serious conflicts developed." (**Bates**, *The Social and Psychological Consequences of a Natural Disaste*r, 1963, p. 61)

Thermal Radiation: "Electromagnetic radiation emitted (in two pulses from an airburst) from the fireball as a consequence of its very high temperature; it consists essentially of ultraviolet, visible, and infrared radiations. In the early stages (first pulse of an air burst), when the temperature of the fireball is extremely high, the ultraviolet radiation predominates; in the second pulse, the temperatures are lower and most of the thermal radiation lies in the visible and infrared regions of the spectrum. For high-altitude bursts (above 100,000 feet), the thermal radiation is emitted as a single pulse, which is of short duration below about 270,000 feet but increases at greater burst heights." (**Glasstone**, *The Effects of Nuclear Weapons*, 3rd Ed., 1977, p. 640)

Third Party Logistics (3PL). (FEMA 2008)

Threat: "The presence of a hazard and an exposure pathway; threats may be natural or human-induced, either accidental or intentional." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 59)

Threat: "*Threat* is the likelihood of a type of attack that might be attempted, or that the scenario will occur." (**DHS**, *FDC 1*, Nov. 2007, B-2)

Threat: "Definition: any entity, action, or occurrence, whether natural or man-made, that has or indicates the potential to pose violence or danger to life, information, operations and/or property. Extended Definition: includes capabilities, intentions, and attack methods of adversaries used to exploit and circumstances or occurrences with the intent to cause harm." (**DHS**, *Lexicon: Terms and Definitions*, October 19, 2007, p. 26)

Threat: "The intention and capability of an adversary to undertake actions that would be detrimental to CI/KR." (**DHS**, *NIPP*, 2006, p. 105)

Threat: "An indication of possible violence, harm, or danger." (**DHS**, *NIMS*, 2004, p. 137)

Threat: "The likelihood of a hazard occurring." (**HHS**, *Medical Surge Capacity and Capability Handbook*, August 2004, p. D-12, Glossary)

Threat: "Potential cause of an unwanted incident, which may result in harm to individuals, a system or organization, the environment or the community." (**ISO 22399**, *Societal Security*…, 2007, 7)

Threat, Terrorism (DHS Model Used in Determining Relative Risk): "Data:

- On-going plot lines [which] reflects DHS analysis of threat information having a nexus with international terrorism or its affiliates.
- Credible reporting
- Relevant investigations to create threat tiers." (**GAO**, *Homeland Security*: *DHS Improved its Risk-Based Grant Programs' Allocation and Management* Methods..., 11Mar08; citing DHS Chief Intelligence Officer and intelligence community data)

Threat Assessment, 1953: "It is accepted that the Soviet Union is now capable of striking any target within the United States. It is assumed for planning purposes that such an attack, if it comes, will consist principally of nuclear weapons delivered by air, and detonated above ground during normal working hours. It is further assumed that high explosive and incendeiary bombs will also be used, that sabotage will be employed, and that biological and chemical weapons will be used. Psychological warfare techniques of all kinds also will be used to disrupt defense programs, impair production, create panic, and weakin our will to resist overt attacks." (**FCDA**, *1953 Annual Report*, p. 9)

Threat Assessment Inquiry: "The primary purpose of a threat assessment is to prevent targeted violence. The threat assessment process is centered upon on analysis of the facts and evidence of behavior in a given situation. The appraisal of risk in a threat assessment focuses on actions, communications, and specific circumstances that might suggest that an individual intends to mount an attack and is engaged in planning or preparing for that event.

In a situation that becomes the focus of a threat assessment inquiry or investigation, appropriate authorities gather information, evaluate facts, and make a determination as to whether a given student *poses* a threat of violence to a target. If an inquiry indicates that there is a risk of violence in a specific situation, authorities conducting the threat assessment collaborate with others to develop and implement a plan to manage or reduce the threat posed by the student in that situation.

Six principles form the foundation of the threat assessment process. These principles are:

- Targeted violence is the end result of an understandable, and oftentimes discernible, process of thinking and behavior.
- Targeted violence stems from an interaction among the individual, the situation, the setting, and the target.
- An investigative, skeptical, inquisitive mindset is critical to successful threat assessment.
- Effective threat assessment is based upon facts, rather than on characteristics or 'traits'.
- An 'integrated systems approach' should guide threat assessment inquiries and investigations.
- The central question in a threat assessment inquiry or investigation is whether a student *poses* a threat, not whether the student has *made* a threat." (**US Secret Service and DOE**, *Threat Assessment in Schools*, 2002)

Threat Index (DHS Model Used in Determining Relative Risk Scores): "The Threat Index accounted for 20 percent of the total risk score, which was calculated by the intelligence community by assessing threat information for multiple years (generally, from 9/11 forward) for all candidate urban areas and categorizing urban areas into one of four tiers. Tier I included those at highest threat, relative to the other areas, and tier IV included those at lowest threat relative to the others. DHS's Office of Intelligence and Analysis performed this review and provided these threat assessments and corresponding threat values for each urban area. In contrast, for the 2006 grant cycle, DHS used total counts of threats and suspicious incidents and incorporated these into its model. The final threat assessments are approved by the intelligence community—the Federal Bureau of Investigation, Central Intelligence Agency, National Counter-Terrorism Center, and the Defense Intelligence Agency—along with the DHS Under Secretary for Intelligence & Analysis and the Secretary of DHS, according to DHS officials." (**GAO**, *Homeland Security*: *DHS Improved its Risk-Based Grant Programs' Allocation and Management Methods, But Measuring Programs' Impact on National Capabilities Remains a Challenge*, 11March08, p. 10)

Threat Level System (**Color-Coded):** The "Color-coded Threat Level System is used to communicate with public safety officials and the public at-large through a threat-based, color-coded system so that protective measures can be implemented to reduce the likelihood or impact of an attack. Raising the threat condition has economic, physical, and psychological effects on the nation; so, the Homeland Security Advisory System can place specific geographic regions or industry sectors on a higher alert status than other regions or industries, based on specific threat information." (**DHS**, *Homeland Security Advisory System*, 2007)

Threat-Vulnerability Integration System (TVIS): Pilot DHS Science & Technology Program "which combines and fuses data in unique ways to create and share knowledge of potential terrorist threats." (DHS/OIG, ADVISE Report, June 2007, p. 5)

Thunderstorm: Sudden electrical discharges manifested by a flash of light (lightning) and a sharp or rumbling sound (thunder). Thunderstorms are associated with convective clouds (Cumulonimbus) and are, more often, accompanied by precipitation in the form of rain showers or hail, or occasionally snow, snow pellets, or ice pellets. (**WMO** 1992, 622)

TIA: Terrorism Incident Annex.

TIB: Toxic Industrial Biological. (**JCS/DOD**, *CBRNE CM* (JP 3-41) 2006, p. GL-5)

TIC: Toxic Industrial Chemical. (**JCS/DOD**, *CBRNE CM* (JP 3-41) 2006, p. GL-5)

TICP: Tactical Interoperable Communications Plan. (**DHS/ODP**, *ODP TICP FAQs*, 2005)

Tidal Bore (Wave): "An abrupt rise of tidal water (caused by atmospheric activities) moving rapidly inland from the mouth of an estuary." (**UNDHA**, *DM Glossary*, 1992, 74)

Tier 1 Critical Infrastructure Assets: "Tier 1 assets encompassed those that if attacked could cause major national or regional impacts similar to those from Hurricane Katrina or 9/11…"

(GAO, *Homeland Security*: *DHS Improved its Risk-Based Grant Programs' Allocation and Management Methods*…, March 11, 2008, p. 12)

Tier 2 Critical Infrastructure Assets: Tier 2 assets are those with potential national or regional impacts if attacked. (GAO, *Homeland Security*: *DHS Improved its Risk-Based Grant Programs' Allocation and Management Methods*…, March 11, 2008, p. 12)

[GAO notes that there the DHS risk model includes more than 2,000 critical infrastructure assets in Tier 1 and Tier 2.]

Tiered Emergency Response System: "In the United States, response to an emergency is primarily a local responsibility…. When local resources are overwhelmed by an event or if specific required technical capabilities are not available, local leaders may implement existing mutual-aid agreements to request additional support from neighboring communities and seek supplemental assistance through county and state emergency management systems…. If the state, including its National Guard (NG), lacks sufficient assets in quantity or technical response capability to mitigate a disaster, the governor may request outside (state or federal) assistance." (**Dept. of the Army**, *WMD – Civil Support Team Operations*, 2007, p. 1-2)

Tiered Response -- Second of Five Key National Response Framework Principles : "Incidents must be managed at the lowest possible jurisdictional level and supported by additional response capabilities when needed. It is not necessary that each level become overwhelmed, or fail, prior to surging resources from another level. Just the contrary, a tiered response will also be a forward-leaning response. Most incidents begin and end locally and are wholly managed at the community level. Many incidents require additional resources or support from across the community, and some require additional support from neighboring communities or the State. A few require Federal support. National response protocols recognize this and are structured to provide additional, tiered levels of support when there is a need for additional resources or capabilities to support and sustain the response and initial recovery. During large-scale events, all levels will take proactive actions to respond, anticipating resources that may be required." (**DHS**, *NRF Comment Draft*, September 2007, p. 9)

Tiger Team: "Tiger Teams (or to use Total Quality Management terminology, Process Action Teams) are formed for a definite duration to accomplish a specific task. They are not permanent, standing organizations." (**USACE**, *Establishing a National Hurricane Response Pgm.,* 6Oct05)

TIH: Toxic Inhalation Hazard. "…a gas or volatile liquid which is known to be so toxic to humans as to pose a hazard to health during transportation, or in the absence of adequate data on human toxicity, is presumed to be toxic to humans because when tested on laboratory animals it has an LC50 value of not more than 5000 ppm." (**DOT**, *Emergency Response Guidebook…Hazardous Materials Incidents*, 2004, pp. 4 and 364)

TIIDE: Terrorism Injuries, Information, Dissemination and Exchange Project.

TIM: Toxic Industrial Material. (**JCS/DOD**, *CBRNE CM* (JP 3-41) 2006, p. GL-5)

Time, Distance, Shielding: "Three basic concepts apply to all types of ionizing radiation. When we develop regulations or standards that limit how much radiation a person can receive in a particular situation, we consider how these concepts might affect a person's exposure….**Time**: The amount of radiation exposure increases and decreases with the time people spend near the source of radiation. In general, we think of the exposure time as how long a person is near radioactive material. It's easy to understand how to minimize the time for external (direct) exposure. Gamma and x-rays are the primary concern for external exposure. However, if radioactive material gets inside your body, you can't move away from it. You have to wait until it decays or until your body can eliminate it. When this happens, the biological half-life of the radionuclide controls the time of exposure. Biological half-life is the amount of time it takes the body to eliminate one half of the radionuclide initially present. Alpha and beta particles are the main concern for internal exposure…. **Distance**: The farther away people are from a radiation source, the less their exposure. How close to a source of radiation can you be without getting a high exposure? It depends on the energy of the radiation and the size (or activity) of the source. Distance is a prime concern when dealing with gamma rays, because they can travel long distances. Alpha and beta particles don't have enough energy to travel very far. As a rule, if you double the distance, you reduce the exposure by a factor of four. Halving the distance, increases the exposure by a factor of four…. **Shielding**: The greater the shielding around a radiation source, the smaller the exposure. Shielding simply means having something that will absorb radiation between you and the source of the radiation (but using another person to absorb the radiation doesn't count as shielding). The amount of shielding required to protect against different kinds of radiation depends on how much energy they have… A thin piece of light material, such as paper, or even the dead cells in the outer layer of human skin provides adequate shielding because **alpha particles** can't penetrate it. However, living tissue inside body, offers no protection against inhaled or ingested alpha emitters….Additional covering, for example heavy clothing, is necessary to protect against beta-emitters. Some **beta particles** can penetrate and burn the skin…Thick, dense shielding, such as lead, is necessary to protect against **gamma rays**. The higher the energy of the gamma ray, the thicker the lead must be. X-rays pose a similar challenge, so x-ray technicians often give patients receiving medical or dental X-rays a lead apron to cover other parts of their body." (**EPA**, *Radiation Protection Basics*, 2007 Update)

Time Unit (ICS): "The unit within the Finance/Administration Section responsible for recording time for incident personnel and equipment." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 59)

"Timing" Risks, Insurance: "…the event happens before sufficient premiums have been collected to fund payment of claims."[121] (**Financial Services Roundtable**, *Nation Unprepared*, 2007, 45)

[121] "The larger the losses from an insured event, the more significant the timing risk. For example, according to information supplied by the Insurance Information Institute, homeowners' losses in Louisiana from Katrina wiped out 25 years of insurance premiums collected in the state. In Mississippi, the damages from Katrina wiped out 17 years of premiums." (**FSR**, *Mega-Catastrophe*, 2007 45)

TIPP: Targeted Infrastructure Protection Program. (**DHS**, *Office of SLGCP FY 2006 Program Budget Review*, May 24, 2005, 15 slides, slide 7)

TIR: Toxic Industrial Radiological. (**JCS/DOD**, *CBRNE CM* (JP 3-41) 2006, p. GL-5)

TISP. The Infrastructure Security Partnership.

Title Ill, SARA: Emergency Planning and Community Right-to-Know Act.

Title 10 Status: "In rare circumstances, the President would federalize National Guard forces for domestic duties under Title 10. In such cases, the forces are no longer under the command of the Governor. Instead, the Department of Defense assumes full responsibility for all aspects of the deployment, including command and control over National Guard forces." (**DHS**, *NRF Comment Draft*, September 2007, p. 38)

Title 32 Status: "National Guard forces employed under State Active Duty or Title 32 status are providing support to the Governor of their State and are not part of Federal military response efforts. When the National Guard is deployed in State Active Duty status, the Governor retains command and control of forces inside his or her State or territory. State Active Duty is based on State statute and policy, and the State is responsible for all costs relating to the deployment. Title 32 Full-Time National Guard Duty refers to Federal training or other duty, other than inactive duty, performed by a member of the National Guard. Title 32 is not subject to *posse comitatus* restrictions and allows the Governor, with the approval of the President or the Secretary of Defense, to order a Guard member to duty to: (1) Perform training and other operational activities. (2) Undertake activities for the military protection of the territory or domestic population 1 of the United States, or of the infrastructure or other assets of the United States determined to be critical to national security, from a threat or aggression against the United States. (3) Conduct homeland defense activities that the Secretary of Defense determines to be 6 necessary and appropriate for participation by the National Guard units or members." (**DHS**, *NRF Comment Draft*, September 2007, p. 37)

Title 10 USC (Armed Forces): "Title 10 USC [US Code] provides guidance on the Armed Forces. Guidance is divided into 5 subtitles. One on general military law and one each for the US Army, US Navy and US Marine Corps, the US Air Force and the RC. Chapter 18 (sections 371-382) of Title 10 USC is entitled and governs Military Support for Civilian LEAs." (**JCS/DoD**, *Civil Support* (JP 3-28), 2007, p. F-2)

Title 14, USC, sections 2, 19, 89, 141, and 143 define the statutory authority of the USCG during HS missions. (**JCS/DoD**, *Homeland Security*, (JP 3-26), 2005, p. A-5)

Title 18, USC, Section 1385, *The Posse Comitatus Act,* 1878.

Title 31, USC, Section 1535, *The Economy Act*.

Title 32 USC (National Guard). "Title 32 USC authorizes the use of federal funds to train NG

members while they remain under the C2 of their respective state governors. In certain limited instances, specific statutory or Presidential authority allows for those forces to perform operational missions funded by the Federal government, while they remain under the control of the governor. Examples of those exceptions include the employment of WMD-CSTs, CD missions, and operations authorized by the President or SecDef under 32 USC 502(f) (i.e., Airport Security Mission in 2001 and Southwest Border Security Mission in 2006)." (**JCS/DoD**, *Civil Support* (JP 3-28), 2007, pp. F-2 and F-3)

Title 36, US Code of Federal Regulations, Part 1236: *Management of Vital Records*, July 1, 2005 Revision.

Title 41, US Code of Federal Regulations, 102743.230 through 74.260**:** *Occupant Emergency Program*, July 1, 2005 Revision.

Title 42 USC, Section 5121 et seq, *The Stafford Act, as amended*.

Title 44 US Code of Federal Regulations, Part 2, Subpart A: *Organization, Functions, and Delegations of Authority*, October 1, 2005.

TLC: Training Leaders Council, DHS.

TMOSA: Temporary Medical-and-Operations Staging Area. (**HSGAC**, *Nation Unprepared*)

TOC: Tactical Operations Center. (**FBI**, USG Interagency Dom. Ter. CONPLAN, 2001, A-1)

Top-Down and Bottom-Up Approaches: "As a former Governor, I am keenly aware of the shared responsibility that exists between the federal, state, and local governments for homeland security. In fact, over the past year I have often said that "when our hometowns are secure, our homeland will be secure." That is not merely rhetoric, but a fundamental principle of the nation's homeland security effort." (DHS, *The Nomination of The Honorable Tom Ridge to be Secretary of the Department of Homeland Security*, January 19, 2003)

Top Management: "Directors and officers of an organization that can ensure effective management systems, including financial monitoring and control systems have been put in place to protect assets, earning capacity and the reputation of the organization." (**ISO 22399**, *Societal Security*…, 2007, 7)

TOPOFF: Top Officials.

TOPOFF 1 Full-Scale Exercise (May 2000): "TOPOFF 2000 was a single, full-scale exercise conducted over 10 days in three venues:

- Denver, CO: Bioterrorism attack (Plague).
- Portsmouth, NH: Chemical attack (Sulfur Mustard).
- National Capital Region: NCR 2000, concurrent but separate exercise (Radiological Dispersal Device).

Exercise TOPOFF (Top Officials) 2000 was a Congressionally mandated, "no-notice" national exercise held in May 2000. It was designed to assess the nation's crisis and consequence management capability by exercising the plans, policies, procedures, systems, and facilities through local, state, and Federal responses to geographically-dispersed terrorist threats and acts. The exercise was co-sponsored by the Department of Justice (DOJ) and the Federal Emergency Management Agency (FEMA), which were designated as the lead agencies for the exercise by the Senate Appropriations Committee in Senate Report 105-235. The exercise was the largest peacetime terrorism exercise ever sponsored by DOJ or FEMA." (Global Security.org. "TOPOFF 1." August 4, 2006 update)

TOPOFF 1 Exercise Lessons Learned: "Top Off 1 showed us that multiple control centers, numerous liaisons, and an increasing number of response teams only complicated coordination and unity of effort…. Top Off 1 also demonstrated that threat information and a common threat picture need to be shared in a timely manner….We also learned a few other lessons as well. Educating, exercising, and equipping crisis and consequence managers and responders remains a national priority…. Just as important, Top Off 1 proved that the response required of a large-scale bio-terrorism incident is significantly different from response to other weapons of mass destruction attacks. Additionally, we saw the fragility in a public health structure that lacked both adequate funding to prepare for a bio-terrorist incident and leadership at the federal level." (**DHS**, "Remarks by Secretary Tom Ridge…on…the TOPOFF 2 Exercises," May 5, 2003, p. 2)

TOPOFF 2 Full-Scale Exercise (May 12-16, 2003): "In order to prepare for potential attacks, DHS held a Federal interagency ''dirty bomb'' exercise as part of the Top Officials–2 Exercise (TOPOFF–2) in Seattle, Washington, May 12–16, 2003. The exercise brought to light a number of issues in Federal radiological emergency response and recovery. One of the most important issues raised was how long-term site restoration and cleanup would be accomplished following an act of radiological terrorism." (**DHS**, *Application of Protective Action Guides for Radiological Dispersal Device (RDD) and Improvised Nuclear Device (IND) Incidents; Notice, Part II*., *Federal Register*, Vol. 71, No. 1, January 3, 2006, p. 174)

TOPOFF 2 Full-Scale Exercise (May 12-16, 2003): "The goals of TOPOFF 2 are to improve the nation's capacity to manage extreme events; create broader frameworks for the operation of expert crisis and consequence management systems; validate authorities, strategies, plans, policies, procedures, and protocols; and build a sustainable, systematic national exercise program to support the national strategy for homeland security." (**FEMA**, "TOPOFF 2" FEMA Press Release, May 5, 2003.)

TOPOFF 3 Full-Scale Exercise (**April 4–8, 2005: "**The U.S. Department of Homeland Security's Top Officials Three Exercise (TOPOFF 3) is a Congressionally mandated exercise designed to strengthen the nation's capacity to prevent, prepare for, respond to, and recover from large-scale terrorist attacks involving weapons of mass destruction (WMDs). The TOPOFF 3 Exercise Program, the most comprehensive terrorism response exercise ever conducted in the United States, is made up of a two-year cycle of seminars, planning events and exercises culminating in a Full-Scale Exercise that simulates a coordinated terrorist attack involving biological and chemical weapons. (**DHS**, "TOPOFF 3 Exercise," April 25, 2006.

TOPOFF 4 Full-Scale Exercise (October 15-20, 2007): "The TOPOFF 4 Full-Scale Exercise builds on knowledge derived from earlier TOPOFF exercises and recent real world events, and contains several new elements:

- Increased coordination with U.S. Department of Defense exercises to combat global terrorism
- Expanded emphasis on prevention – the opportunity to piece together an intelligence "puzzle" and stop an attack before it occurs
- Focus on mass decontamination and large-scale recovery and remediation issues
- Focus on coordinating procedures and communications with a U.S. territory" (**DHS**, "TOPOFF 4: Exercising National Preparedness," Press Release, September 25, 2007.)

TOPOFF 4 Full-Scale Exercise (October 15-20, 2007): "The recent TOPOFF 4 Exercise specifically focused on responding to RDD [Radiological Dispersion Device] attacks in three different geographic areas." (**FEMA**, *Statement for the Record*, 2007, p. 2)

TOPOFF 4 Full-Scale Exercise (October 15-20, 2007): 'This year's Tier I NLE {National Level Exercise] exercise is Top Officials (or TOPOFF) 4, the National Domestic Counterterrorism Exercise Series that is the Nation's premier terrorism preparedness exercise program involving top officials at every level of government, as well as representatives from the international community and private sector. The TOPOFF 4 exercise, to be held October 15-20 of this year, is the cornerstone of the National Exercise Program (NEP) and is a Tier I National Level Exercise for FY 2008.

"The TOPOFF program in general and TOPOFF 4 in particular are centered on U.S. Government-wide strategy and policy-related issues. In this sense, they are designed to address the priorities of the U.S. government in its entirety, and do not focus on individual issues at the department or agency level. To achieve this U.S. government-wide goal, TOPOFF 4 will be organized around *one* of the 15 national planning scenarios – Scenario 11, use of a radiological dispersal device (RDD). TOPOFF 4 will require Federal, State, local, and private sector players to respond to multiple, simultaneous RDD attacks on American soil.

"The exercise will be executed with the participation of all appropriate Cabinet-level secretaries or their deputies, and will include the activation of all necessary operations centers to accurately simulate a truly national response to these major terrorist incidents. This will include the utilization of all five elements of the National Operations Center and the FEMA Region IX and X Regional Response Coordination Centers. In addition, the FEMA Emergency Response Teams and Federal Incident Response Support Teams as well as DHS Situational Awareness Teams will activate in each of the venues and will simulate the establishment of a Joint Field Office in accordance with the latest National Response Framework guidance.

"For TOPOFF 4, approximately 15,000 Federal, State, territorial, and local officials will participate in a robust, full-scale response to a multi-faceted terrorist threat in three primary venues: Guam, Oregon, and Arizona. In each of these venues, exercise participants will be expected to mobilize their prevention and response capabilities, make difficult decisions, and carry out essential emergency response and recovery functions.

"In addition, the TOPOFF 4 exercise will use a single, common scenario in each of the venues to test prevention, response, and recovery capabilities; it will allow for the synchronization of National, Federal, State, local, and private sector plans; it will test a common evaluation standard; and it will incorporate lessons learned, best practices, and corrective actions identified in previous TOPOFF exercises.

"*Partners*: Our partners in this exercise include over 40 agencies, departments, and offices throughout the federal interagency community, the White House (i.e., Homeland Security Council (HSC) and National Security Council (NSC)), representatives from Oregon, Guam, and Arizona, several nongovernmental and private sector organizations, and several international partners. (Australia, Canada, and the United Kingdom have all agreed to participate in the exercise, and more than 30 other countries and international organizations will serve as exercise observers.)

"*Goals*: The goals of TOPOFF 4 are threefold. First and foremost, to assess the Nation's capability to prevent, respond to, and recover from realistic and threat-based acts of terrorism. Second, to examine relationships between Federal, State, local, and Tribal jurisdictions and the private sector in response to a realistic and challenging series of integrated, geographically dispersed terrorist threats and attacks. And third, to use performance-based objectives to evaluate the interaction between Federal, State, local, and private sector emergency preparedness, prevention, response, and recovery plans, policies, and procedures. Achieving each of these goals under the umbrella of one national-level exercise, allows the U.S. government—and its State, local, private sector, and international exercise partners—to test its ability to respond to a major incident, identify gaps in performance and take concrete steps towards improvement of the Nation's ability to prevent, respond to, and recover from terrorist attacks." (**FEMA**, *Statement of Schrader*, October 3, 2007, pp. 5-7)

TOPOFF 4 Full-Scale Exercise (October 15-20, 2007): "TOPOFF 4 was conducted this October as a Full Scale Exercise in three locations: Arizona, Guam and Oregon. In accordance with the NEP, the TOPOFF 4 Full Scale Exercise was designated as a Tier I National Level Exercise for Fiscal Year 2008. This exercise centered on White House directed, government-wide strategy and policy-related issues. It was conducted with the participation of all appropriate Secretaries (or their Deputies), other senior officials, and all necessary operations centers. While the TOPOFF 4 scenario was focused on RDDs [Radiation Dispersal Devices], this exercise reflected USG-wide priorities, not single department or agency programs.

"Building on knowledge derived from earlier Federal-level exercises and recent real world events, TOPOFF 4 contained several new elements including: increased coordination with the Department of Defense, expanded emphasis on prevention – the opportunity to piece together an intelligence "puzzle" and stop an attack before it occurs, as well as the focus on mass decontamination and long-term recovery and remediation issues. The inclusion of Guam as one of the three venues also focused efforts on coordinating procedures and communications with a U.S. territory. TOPOFF 4 was the first exercise in the series to focus on one specific event - RDDs. The selection of this event in all three venues allowed the Federal Government, in coordination with State, Territorial, County and City partners to evaluate capabilities required in

a response to near simultaneous events of a similar type." (**FEMA**, *Statement of Glenn Cannon*, November 15, 2007, pp. 15-16)

TOR: Terms of Reference. (**DSB**, *Report of DSP TF on CHIP*, 2007, p. 6)

Tornado: "Tornadoes are extremely complex wind events that cause damage ranging from minimal or minor to absolute devastation…. In a simplified tornado model, there are three regions of wind:

1. Near the surface, close to the core or vortex of the tornado. In this region, the winds are complicated and include the peak low level wind speeds, but are dominated by the tornado's strong rotation. It is in this region that strong upward motions occur that carry debris upward, as well as around the tornado.
2. Near the surface, away from the tornado's core or vortex. In this region, the flow is dominated by inflow to the tornado. The inflow can be complicated and is often concentrated into relatively narrow swaths of strong inflow rather than a uniform flow into the tornado's core circulation.
3. Above the surface, typically above the tops of most structures, the flow tends to become very nearly circular.

In an actual tornado, the diameter of the core or vortex circulation can change with time, so it is impossible to say precisely where one region of the tornado's flow ends and another begins. Also, the visible funnel cloud associated with and typically labeled the vortex of a tornado is not always the edge of the strong extreme winds. Rather, the visible funnel cloud boundary is determined by the temperature and moisture content of the tornado's inflowing air. The highest wind speeds in a tornado occur at a radius measured from the tornado core that can be larger than the visible funnel cloud's radius. It is important to remember that a tornado's wind speeds cannot be determined just by looking at the tornado." (**FEMA**, *Building Performance Assessment Report: Midwest Tornadoes of May 3, 1999*, July 13, 1999, p. 2-4)

Tornado: A tornado is a violently rotating column of air extending from a thunderstorm to the ground. The most violent tornadoes are capable of tremendous destruction with wind speeds of 250 mph or more. Damage paths can be in excess of one mile wide and 50 miles long. In an average year, 800 tornadoes are reported nationwide. Every state is at some risk from this hazard." (**FEMA**, "Fact Sheet – Tornadoes," January 2007, p. 1)

Tornado: "Historically, tornadoes have resulted in the greatest loss of life of any natural hazard, the mean annual death toll being 111. Property damage due to tornadoes is in the tens of millions of dollars annually. Most States east of the Rocky Mountains are subject to this hazard." (**FEMA**, *Hazard Identification, Capability Assessment, and Multi-Year Development Plan*, 1985, p. A-2)

Tornado: A violently rotating storm of small diameter; the most violent weather phenomenon. It is produced in a very severe thunderstorm and appears as a funnel cloud extending from the base of a Cumulonimbus to the ground. (**WMO** 1992, 626)

Total Asset Visibility (TAV): "…a system that provides asset and in-transit visibility as well as electronic order management for all primary commodities." (**FEMA**, *FEMA's Logistical Planning Efforts*, 2007)

Total Disaster Risk Management: "The Asian Disaster Reduction Center (ADRC) has been promoting a culture of disaster reduction by advocating disaster reduction as a core part of government policy and raising public awareness in the Asian Region. ADRC and the Asian Disaster Response Unit of the United Nations Office for the Coordination of Humanitarian Affairs Kobe (UN-OCHA/Kobe) have developed the Total Disaster Risk Management (TDRM) as an effective and strategic approach to disaster reduction that is based on many years of experience in coping with natural disasters worldwide, particularly in Asia.

The concept of TDRM centers around two crucial principles: "the involvement of all stakeholders" and "implementation at all phases of disaster risk management," namely the prevention/mitigation, preparedness, response and rehabilitation/reconstruction phases (Figure 2.1). Since damage stems from the combination of hazards, exposure and vulnerability, TDRM, as a holistic approach which covers relevant stakeholders and all phases, is essential in disaster risk management." (**ADRC**, *TDRM: Good Practices* (Chapter 2, *Outline of TDRM*), 2006 p. 2)

Total-System Exercises: "These are locally- tailored exercises involving all key local officials, and EOC and other personnel, and two or more such exercises shall have been held- Total-system exercises are appropriate and useful only when the community has developed its emergency procedures and organization to the point where all elements can be exercised and tested together. Total-system exercises are designed and conducted to meet the following objectives:

(1) Exercising the making of coordinated responses and assignment of resources under simulated peacetime disaster or attack conditions (a fallout-only or a fallout-blast-fire situation, as appropriate in the locality). whether based on a peacetime or attack-caused disaster scenario, the exercise shall include problems for all elements of the local emergency organization, requiring maximum use of existing local capabilities. Half or more of the problems shall be such as to require operational coordination between at least two services. The exercise shall be tailored to the jurisdiction's actual organization and EOC and other procedures.

(2) Exercising decision-making and operations involving all elements of the local emergency organization. This shall involve the entire EOC staff. In addition, it is strongly recommended that all other key elements of the local emergency organization be involved to the maximum extent possible (e.g., selected police and fire units, radiological monitors, shelter managers, Shelter Complex Headquarters staffs, communications personnel,' hospital administrators and staffs, welfare group directors, news media personnel, and others with emergency assignments outside of the EOC). Hospital disaster plans can be exercised in conjunction with the exercise involving other elements of the jurisdiction's emergency organization. In cases where it is not possible to involve the majority of the organization outside the EOC, simulation techniques may be used to represent such groups. However, any capability or organization simulated must actually exist, and evaluators must have reasonable confidence that such group could actually have carried out the functions that were represented by simulation in the exercise. (E.g., if the radiological

monitoring organization is simulated, it must be an actual capability even if radiological monitors were not physically located at monitoring stations of in shelters during the exercise. Confidence that the RM organization could actually have carried out the functions simulated shall be based on previous sub-system exercises or training involving the RN organization.) Thus, total-system exercises differ from many of the Emergency Operations Simulation (EOS) exercises that localities have had in that EOS's often simulate emergency organizations and capabilities that do not exist, or are not fully ready to operate." (**DCPA**, *Standards for Local Civil Preparedness*, 1978, pp. 35-36)

Toxic Industrial Biological (TIB): "This category encompasses any biological material manufactured, used, transported, or stored by industrial, medical, or commercial processes which could cause a potential infectious or toxic threat. It includes those biohazards which are infectious agents or hazardous biological materials that present a risk or potential risk to the health of humans, animals or the environment. The risk can be direct through infection or indirect through damage to the environment. Biohazardous materials include certain types of recombinant DNA [deoxyribonucleic acid]; organisms and viruses infectious to humans, animals, or plants (parasites, viruses, bacteria, fungi, prions, rickettsia); and biologically active agents (toxins, allergens, venoms) that may cause disease in other living organisms or cause significant impact to the environment or community. TIBs are often generated as infectious waste (sharps and body fluid contaminated material) and as biological samples (biopsies, diseases for research, etc.)." (**JCS/DOD**, *CBRNE CM*, (JP 3-41), 2006, p. I-7)

Toxic Industrial Chemical (TIC): "Toxic industrial chemicals are industrial chemicals that are manufactured, stored, transported, and used throughout the world. Toxic industrial chemicals can be in the gas, liquid, or solid state. They can be chemical hazards (e.g., carcinogens, reproductive hazards, corrosives, or agents that affect the lungs or blood) or physical hazards (e.g., flammable, combustible, explosive, or reactive)." (**OSHA**, *Toxic Industrial Chemicals*, accessed November 21, 2007)

Toxic Industrial Chemical Scenario (15 National Planning Scenarios): "The Toxic Industrial Chemical scenario involves a fire and toxic industrial chemical release from a petroleum refinery caused by terrorist attack using rocket-propelled grenades and explosive devices. There are 350 fatalities, 1,000 hospitalized victims, 10,000 evacuated, 1,000 seeking shelter, 25,000 shelter-in-place, and 100,000 self-evacuating. One-half of the structures at the refinery are damaged from explosions." (**DHS**, *TCL,* 2007, p. 206)

Toxic Industrial Radiological (TIR): "TIRs are any hazardous radioactive material manufactured, used, transported, or stored by industrial, medical, or commercial processes. Radioactive waste, such as spent fuel rods and medical radiological material, is a major source of these materials. By far the largest quantities of radioactive waste — in terms of both radioactivity and volume — are generated by the commercial nuclear power and military nuclear weapons production industries, and by nuclear fuel cycle activities to support these industries such as uranium mining and processing. Radioactive waste is classified by origin not on the physical and chemical properties of the waste that could determine its safe management. Radioactive materials can produce toxic or long term health effects to personnel, and can cause

contamination. Damaging effects from radiological materials are caused by neutron, gamma, beta, and alpha ionizing radiation." (**JCS/DOD**, *CBRNE CM* (JP 4-41), 2006, p. I-8)

Toxic Inhalation Hazard (TIH): "Term used to describe gases and volatile liquids that are toxic when inhaled. (Same as PIH)." (**DOT**, *Emergency Response Guidebook*, 2004, p. 364)

Toxics Release Inventory (TRI): "Federal law requires certain facilities that manufacture, process, or use any of 581 toxic chemicals to report annually to EPA and their state on the amount of those chemicals released into the air, water, or soil. It also requires EPA to make this information publicly available through the Toxics Release Inventory (TRI) database. Facilities must either (1) submit a detailed TRI Form R for each designated chemical used in excess of certain thresholds or (2) file a simpler Form-A certifying that they need not do so." (**GAO**, *Toxic Chemical Releases*, November 2007, p. 2)

Toxin: "Toxins are poisons formed as specific secreting products by vegetable or animal organisms such as plants, snakes, spiders, and sea creatures. Toxins act faster and are more stable than live pathogens. Many toxins can be easily produced." (**DA**, *WMD-CST Ops*, 2007, 3-5)

TPEP: Terrorism Prevention Exercise Program. (**DHS**, *HSEEP Quarterly Newsletter*, Mar 07)

TPFDL: Federal Time Phased Force Deployment List, managed by FEMA. (**USACE**, *CDRP, Anchorage*, 2005, p. v)

TPOC: Training Point of Contact. (**FEMA**, *TEI/TO Course Catalog*, 2008, 6)

Tracking and Reporting Resources: "Standardized, integrated process conducted throughout the life-cycle of an incident. This process provides incident managers with a clear picture of where resources are located, helps staff prepare to receive resources, protects the safety of personnel and security of supplies and equipment, and enables the coordination of movement of personnel, equipment, and supplies. (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 59)

TRADOC: US Army Training and Doctrine Command. **DA**, *WMD-CST Ops*, 2007, Glossary-6

Tragedy: "An intensely sad, calamitous, or fatal event or course of events; disaster" (**Funk & Wagnalls** 1996).

> "The word 'tragedy' summons up in one's mind the inevitability not only of this event but of other similar events in the past and more to follow. Responsibility can be successfully abrogated with the application of the label 'tragedy'…One needs to look no further into the cause or causes of this event because it has now been lifted outside of one's power and into the domain of Greek drama and fate. As a tragedy, it was fated to be and the only possible response is to accept it (and others of its kind) as part of the inescapable human situation. The event may be mourned and one may sympathize briefly with the victims. But one is freed (by thinking of it as a tragedy) from the need to examine the conceptual apparatus that led to this outcome" (**Allinson** 1993, 14).

Training: "Planned activities which support and improve individual and organizational performance and effectiveness, such as on-the-job training, career development programs, professional development activities or developmental assignments." (**DHS**, *Training Lexicon*, Version 1.2, Dec 2007, p. 62)

Training: "Building essential response capabilities nationwide requires a systematic program to train individual teams and organizations – to include governmental, nongovernmental, private-sector, and voluntary organizations – to meet a common baseline of performance and certification standards. Professionalism and experience are the foundation upon which successful response is built. Rigorous, ongoing training is thus imperative.25 Individuals and teams, whether paid or volunteer, should meet relevant local, tribal, State, Federal, or professional qualifications, certifications, or performance standards. Content and methods of training must comply with applicable standards and produce required skills and measurable proficiency. FEMA and other organizations offer response and incident management training in online and classroom formats." (**DHS**, *National Response Framework*, Jan 2008, 31)

Training and Education: "…the words 'training' and 'education'… are not the same, there being being a significant denotative difference. While training is more concerned with teaching *what* to think and what the *answers* ought to be, education is all about teaching *how* to think and what the *questions* ought to be: 'Training is focused on the development and performance of specific tasks or skills, and education is oriented toward more generalized and abstract knowledge that may or may not be tied to specific tasks or action.'[122] Training is most frequently used when the goal is to prepare an individual or an organization to execute specified tasks. It often includes repetition of tasks, not unlike an athletic team learning to execute plays. Finally, it is normally the preferred method of learning when the goal is to perform operations in which success, failure, and completion can be clearly measured. Education has more to do with how to think about problems and how to deal with those things that may not lend themselves to categorical solutions. It becomes a matter of intellect, thought, indirect leadership, advice, and consensus building." (**McCausland**, *Developing Strategic Leaders for 21st Century*, 8Feb08, 6)

Training and Exercise Integration (FEMA/NPD/NIC/TEI) Mission: "TEI is responsible for coordinating the training, education, and exercise functions and policies within the NIC, FEMA, DHS, and Federal Interagency. Whereas the NIC serves as the oversight body for the subcomponents, TEI exclusively is concerned with policy coordination and ensuring policy serves to rectify where mission areas overlap, are complimentary, or have gaps."

Training & Exercise Plan Workshop (T&EPW): "The Multiyear Training & Exercise Plan is developed at a Training and Exercise Plan Workshop (T&EPW). The T&EPW usually occurs once a year and brings together key exercise personnel from all area agencies to discuss a program's strategy and scheduling of exercise and training for the coming year." (**FEMA,** IS-120 A, *Intro to Ex.,* 23Jan08, 17)

---

[122] Quote is from D. E. McAllister, "Education/Training Discussion," *TRADOC*, January 29, 2001. See also Dianne Jordan, *Evaluation and Implementation of Distance Learning: Technologies, Tools, and Techniques,* Hershey, PA: Idea Group, 2000.

Training and Exercise Integration Secretariat Training Operations (TEI/O), FEMA: "TEI/TO serves the Nation's first responder community, offering more than 100 courses to help build skills that responders need to function effectively in mass consequence events. TEI/TO primarily serves State, local, and tribal entities in 10 professional disciplines, but has expanded to serve private sector and citizens in recognition of their critical role in domestic preparedness. Instruction is offered at the awareness, performance, and management and planning levels. Students attend TEI/TO courses with the basic skills of their profession and learn how to apply them in the context of disaster preparedness, response, and recovery. Course subjects range from weapons of mass destruction (WMD) terrorism, cybersecurity, and agro-terrorism to citizen preparedness. Courses are web based and instructor led and are offered in residence (i.e., at a training facility) or through mobile programs in which courses are brought to locations that request them…. TEI/TO is one of a number of training components located in the NIC. It is the new name given to the former Office of Grants and Training (G&T) Training Division under the reorganization directed in the "Post-Katrina Emergency Management Reform Act" (the Act). On April 1, 2007, components from the DHS Preparedness Directorate, including training programs within G&T, merged with FEMA as directed by the Act. This consolidation formed the new NPD within FEMA. Legacy training organizations from the Preparedness Directorate were consolidated under the umbrella of the newly created NIC, along with existing FEMA training components such as the Emergency Management Institute (EMI). The mission of TEI remains largely the same as it was under the G&T, that is, to make high-quality training available to the first responder community, tailored to enhance the capacity of states and local jurisdictions to prepare for, prevent, deter, and respond and recover safely and effectively from potential manmade and natural catastrophic events, including terrorism. TEI/TO has undergone several name changes since it was organized in 1998 as the Office for Domestic Preparedness (ODP) under the Department of Justice." (**FEMA**, *TEI Secretariat TO Course Catalog*, 2008, p. 1)

Training and Exercise Integration Secretariat Training Operations (TEI/TO) Mission: "The mission of TEI/TO is to make high-quality training available to first responders that enhances their skills for preventing, protecting, responding to, and recovering from manmade and natural catastrophic events." (**FEMA**, *TEI/TO Course Catalog*, 2008, 2)

Training Capability Element (TCL): "Content and methods of delivery that comply with relevant training standards necessary to perform assigned missions and tasks." (**DHS**, *TCL*, 2007, p. 9)

TRANSCOM: Transportation Command. (**HSGAC**, A *Nation Still Unprepared*, 2006, 634)

Transformation: "Transformation requires a combination of technology, intellect and cultural adjustments – adjustments that reward innovation and creativity." (**DOD/JCS**, *The National Military Strategy of the United States of America*, 2004, v)

Transit Security Grant Program (TSGP): "TSGP provides funding to support security enhancements for intercity passenger rail transportation, freight rail, and other security measures. The program addresses three transit modalities: rail transit, intra-city bus transit, and ferry systems." (**DHS/ODP**, *FY 2006 EMPG Program Guidance*, November 2005, p. 10)

Transit Security Grant Program (TSGP): "TSGP supports sustainable, risk-based efforts to protect critical transit infrastructure from terrorism, especially explosives and non-conventional threats that would cause major disruption to commerce and significant loss of life. Funding is provided to owners and operators of the nation's critical transit infrastructure, including rail, intra-city bus, ferry systems, and Amtrak. For the highest risk urban areas, this funding is provided as a regional allocation; for other urban areas, funding is awarded on a competitive basis." (**DHS**, *Fact Sheet: Fiscal Year 2008 Preparedness Grants*, 1Feb2008)

Transitional Shelters: "*Transitional Shelters* are facilities that provide short-term lodging and additional privacy, such as hotels or motels." (**FEMA**, *FEMA Recovery Strategy*, August 2006)

Transparency: "Pandemic preparedness requires transparent communication of accurate information among all levels of government and the public in order to warrant public trust." (**ACLU**, *Pandemic Preparedness*, 2008, 7) "People are more likely to cooperate with reasonable requests when they are confident that government officials are being honest about the probabilities of risk and outcomes, and are willing to acknowledge uncertainty and admit mistakes." (**ACLU**, *Pandemic Preparedness*, 2008, 24)

Transportation Infrastructure Protection Programs (IPP): "Together, the IPP grants fund a range of preparedness activities, including strengthening infrastructure against explosive attacks, preparedness, planning, equipment purchase, training, exercises, security management, and administration costs. IPP programs support objectives outlined in the National Preparedness Guidelines and related national preparedness doctrine, such as the National Incident Management System (NIMS), National Response Framework (NRF), and the National Infrastructure Protection Plan (NIPP) and include…":

- Port Security Grant Program (PSGP)
- Public Transportation Security Grants Program (TSGP)
- Over-the-Road Bus Security Grant Program
- Trucking Security Program (TSP).

TRIEA: Terrorism Risk Insurance Extension Act (2007). (**FSR**, *Nation Unprepared*, 2007, 9) [Note: Extended TRIA to 2014. (**III**, *Catastrophes: Insurance Issues*, Jan 2008)]

Triage: "There are three basic types of triage. Primary triage is the first triage of patients into the medical system (it may occur prehospital), at which point patients are assigned an acuity level based on the severity of their illness/disease. Secondary triage is the reevaluation of the patient's condition after initial medical care… This may occur at the hospital following EMS interventions or after initial interventions in the ED [Emergency Department]. Tertiary triage is the reevaluation of the patients' response to treatment after further interventions and is ongoing during their hospital stay. This is the least practiced and least well-defined type of triage.

"Historically, triage has involved four levels of priority for traumatic injuries:

- Green – delayed treatment – has minor injuries or illness and should not pose a threat to life or limb.
- Yellow – intermediate – has injuries or illness that may result in death or disability but pose no immediate threat to life or limb.
- Red – critical – has injuries or illness that will result in death within the hour unless interventions occur.
- Black – expectant or deceased – is expected to die because of severity of illness or injuries or has died.

"An experienced health care provider should be involved in any decision to classify a patient as "black" during a disaster…all such patients should have access to palliative care (analgesia, sedation, physical and behavioral cares) to the extent possible under the circumstances. Expectant patients should be reassessed regularly for comfort, for improvements in their situation, or in case resources become available unexpectedly.

"Studies have shown that experienced health care providers are generally very accurate at assigning triage levels in the ED on a daily basis,70 though there are no studies to determine to what degree this is true in disasters." (**AHRQ/HHS**, *Mass Medical Care*…, p. 71)

TRO: Transitional Recovry Office, FEMA.

Tropical Cyclone: "A warm-core non-frontal synoptic-scale cyclone, originating over tropical or subtropical waters, with organized deep convection and a closed surface wind circulation about a well-defined center. Once formed, a tropical cyclone is maintained by the extraction of heat energy from the ocean at high temperature and heat export at the low temperatures of the upper troposphere. In this they differ from extratropical cyclones, which derive their energy from horizontal temperature contrasts in the atmosphere (baroclinic effects)." (**NHC**, *Glossary of NHC Terms*, 2007)

Trucking Security Program (TSP): "TSP provides funding to identify and recruit highway professionals (carriers, drivers, first responders, highway workers) to actively participate in an anti-terrorism and security awareness program, as well as implement program training and 24/7 call center support." (**DHS**, *Fact Sheet: FY08 Preparedness Grants*, 1Feb2008)

Trucking Security Program (TSP): Provides funding to continue the "…Highway Watch® Program as a sustainable national program to enhance security and overall preparedness on the Nation's highways. TSP provides competitive grant funds for continued operations of Highway Watch® Program activities which include identifying and recruiting program." (**FEMA**, *Statement of R. David Paulison, Administrator, on the Fiscal Year 2009 President's Budget Before the Committee on Appropriations Subcommittee on Homeland Security, U.S. House of Representatives*, March 11, 2008, p. 6)

Trusted Agent: "Trusted agents are the individuals on the *exercise planning team* who are trusted not to reveal the scenarios details to players prior to the exercise being conducted." (**FEMA**, *HSEEP Glossary*, 2008)

TSP: Trucking Security Program. (**DHS**, *Fact Sheet: FY08 Preparedness Grants*, 1Feb2008)

Tsunami: "Tsunamis (pronounced soo-ná-mees), also known as seismic sea waves (mistakenly called "tidal waves"), are a series of enormous waves created by an underwater disturbance such as an earthquake, landslide, volcanic eruption, or meteorite. A tsunami can move hundreds of miles per hour in the open ocean and smash into land with waves as high as 100 feet or more. From the area where the tsunami originates, waves travel outward in all directions. Once the wave approaches the shore, it builds in height. The topography of the coastline and the ocean floor will influence the size of the wave. There may be more than one wave and the succeeding

one may be larger than the one before. That is why a small tsunami at one beach can be a giant wave a few miles away. Most tsunamis are generated by earthquake-induced movement of the ocean floor. If a major earthquake or landslide occurs close to shore, the first wave in a series could reach the beach in a few minutes, even before a warning is issued. Areas are at greater risk if they are less than 25 feet above sea level and within a mile of the shoreline." (**FEMA**, "Fact Sheet – Tsunami," June 2007, p. 1)

Tsunami: "A sea wave of local or distant origin that results from large sea-floor displacements associated with powerful earthquakes, major submarine landslides, or exploding volcanic islands." (**USGS**, *Putting Down Roots in Earthquake Country*, 2007, Glossary)

Unidentified Persons: "Includes those persons, both injured and deceased, who require the application of scientific methods to verify their identification." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, 40)

UNIDNDR: United Nations International Decade for Natural Disaster Reduction.

Unified Approach: "A major objective of preparedness efforts is to ensure mission integration and interoperability when responding to emerging crises that cross functional and jurisdictional lines, as well as between public and private organizations." (**FEMA**, *NIMS Draft*, 2007, p. 160)

Unified Area Command (UAC): "A unified area command is established when incidents under an area command are multi-jurisdictional." (**USCG**, *IM Handbook*, 2006, Glossary 25-25)

Unified Command (UC): A method for all agencies or individuals who have jurisdictional responsibility, or in some cases who have functional responsibilities at the incident, to contribute to: determination of overall objectives for the incident, and selection of strategies to achieve the objectives.

Unified Command (UC): "UC is an important element in multijurisdictional or multiagency domestic incident management.

> It provides guidelines to enable agencies with different legal, geographic, and functional responsibilities to coordinate, plan, and interact effectively.
>
> As a team effort, UC overcomes much of the inefficiency and duplication of effort that can occur when agencies from different functional and geographic jurisdictions, or agencies at different levels of government, operate without a common system or organizational framework.
>
> All agencies with jurisdictional authority or functional responsibility for any of all aspects of an incident and those able to provide specific resource support participate in the UC structure and contribute to the process of determining overall incident strategies; selecting objectives; ensuring that joint planning for tactical activities is accomplished in accordance with approved incident objectives; ensuring the integration of tactical operations; and approving, committing, and making optimum use of all assigned resources.

"The exact composition of the USC structure will depend on the location(s) of the incident (i.e., which geographical administrative jurisdictions are involved) and the type of incident (i.e., which functional agencies of the involved jurisdiction(x) are required). In the case of some multijurisdictional incidents, the designation of a single IC may be considered to promote greater unity of effort and efficiency." (**DHS**, *NIMS*, 2004, p. 14)

Unified Command (UC): "The primary differences between the single command structure and the UC structure are that

> In a single command structure, the IC is solely responsible (within the confines of his or her authority) for establishing incident management objectives and strategies. The IC is directly

> responsible for ensuring that all functional area activities are directed toward accomplishment of the strategy.
>
> In a UC structure, the individuals designated by their jurisdictional authorities (or by departments within a single jurisdiction) must jointly determine objectives, strategies, plans, and priorities and work together to execute integrated incident operations and maximize the use of assigned resources." (**DHS**, *NIMS*, 2004, p. 16)

Unified Command (UC): "Effective *unified command* is indispensable to all incident response activities and requires a clear understanding of the roles and responsibilities of each participating organization. Success requires *unity of effort,* which respects the chain of command of each participating organization while harnessing seamless coordination across jurisdictions in support of common objectives. Unified command is an important element across multi-jurisdictional or multi-agency incident management activities.

> It provides a structure to enable agencies with different legal, geographic and functional responsibilities to coordinate, plan and interact effectively.
>
> As a team effort, unified command allows all agencies with jurisdictional authority or functional responsibility for the incident to provide joint support through mutually developed incident objectives and strategies established at the command level.
>
> Each participating agency maintains its own authority, responsibility and accountability.

This *Framework* [NRF] employs the *NIMS* structures and tools that enable unified command to be effective in incident management." (**DHS**, *National Response Framework Comment Draft*, September 2007, p. 10)

Unified Command (UC): "The doctrine of *unified command* is applied at the headquarters, regional and field levels to enable diverse agencies to work together effectively. Using unified command principles, participants share common goals and synchronize their activities to achieve those goals. The Federal Government also works to establish *engaged partnership* with States, as well as the private sector. Our national response is more effective when all levels of government work together well before an incident to develop effective plans and achieve a heightened state of preparedness." (**DHS**, *National Response Framework Comment Draft*, Sep. 2007, p. 21)

Unified Command (UC): Term became institutionalized statutorily via the National Security Act of 1947 which authorized establishment of four Unified Commands. (**Ditch**, *Nat'l Response Framework (IAEM Discussion List email*), January 25, 2008)

Unified Command (UC): "Under the ICS [Incident Command System] concept of operations, Unified Command is a unified team effort which allows all agencies with responsibility for an incident, either geographical or functional, to manage an incident by establishing a common set of incident objectives and strategies. This Unified Command effort is accomplished without losing or abdicating agency authority, responsibility, or accountability." (**FEMA** *Disaster Dictionary*, **2001**, p.124; citing ICS Glossary)

Unified Command (UC): "An ICS application used when more than one agency has incident jurisdiction or when incidents cross political jurisdictions. Agencies work together through the designated members of the UC, often the senior person from agencies and/or disciplines participating in the UC, to establish a common set of objectives and strategies and a single IAP." (**FEMA**, *National Incident Management System* (FEMA 501/Draft), August 2007, p. 160)

Unified Command (UC): "Unified Command (UC) is a recognition that the most effective response involves all parties working together to bring their respective expertise to the incident. UC uses a management structure to facilitate cooperation by all sectors with jurisdictional or functional responsibility for resolving the incident. They must work together to develop a common set of objectives and strategies, share information, maximize utilization of resources, and enhance efficiency of the individual response organizations. Joint unified command training should be provided to the public and private sectors. (Jones, *Critical Incident Protocol: A Public and Private Partnership*, 2000, p. 19)

Unified Command (UC): "A standard method to coordinate command of an incident where multiple agencies have jurisdiction." (**NFPA 1561**, 2002, p. 8)

Unified Command (UC): "As a term in the Federal application of the Incident Command System (ICS), defines agencies working together through their designated Incident Commanders at a single Incident Command Post (ICP) to establish a common set of objectives and strategies, and a single Incident Action Plan. This is NOT "unified command" as defined by the Department of Defense." (**US Army TRADOC**, 2007, p. 152)

Unified Command (UC): "An application of ICS used when there is more than one agency with incident jurisdiction or when incidents cross political jurisdictions. Agencies work together through the designated members of the Unified Command to establish their designated Incident Commanders at a single ICP and to establish a common set of objectives and strategies and a single Incident Action Plan. This is accomplished without losing or abdicating authority, responsibility, or accountability." (**USCG**, *IM Handbook*, 2006, Glossary 25-25)

Unified Command Plan: "The document, approved by the President, that sets forth basic guidance to all unified combatant commanders; establishes their missions, responsibilities, and force structure; delineates the general geographic area of responsibility for geographic combatant commanders; and specifies function responsibilities for functional combatant commanders." (**DA**, *WMD-CST Operations*, December 2007, Glossary 18)

Unified Command Suite: "A vehicle which is highly mobile, self-contained, stand-alone C-130 air mobile communications platform intended to provide both voice and data communications capabilities to civil support team commanders." (**DA**, *WMD-CST Ops*, 2007, Glossary 18)

Unified Command System (UCS): "The UC involves a management structure to facilitate public and private teamwork to bring together expertise and resources for managing and resolving a critical incident. Involves joint consultation and decision making. (**Jones**, *Critical Incident Protocol*, 2000, 37)

Unified Coordination Group (UCG): Under the National Response Framework, "Using unified command principles, a *Unified Coordination Group* comprised of senior officials from the State and key Federal departments and agencies is established at the JFO. This group of senior officials provides the breadth of national support to achieve shared objectives." (**DHS**, *NRF Comment Draft*, September 2007, pp. 49-50)

"The Unified Coordination Group oversees the development of an exit strategy and demobilization plan. As the need for full-time interagency response coordination at the JFO wanes, the Unified Coordination Group plans for selective release of Federal resources, demobilization, transfer of responsibilities and closeout." (**DHS**, *NRF Comment Draft*, September 2007, p. 42) See, also, p. 68.

Unified Coordination Group (UCG): "…the *Framework* recognizes two senior leaders appointed by the Governor to work in coordination with the Federal JFO team."

- State Coordinating Officer (SCO)
- Governor's Authorized Representative. (**DHS**, *NRF*, 2008, p. 52)

Unified Coordination Group (UCG): "The term Unified Coordination Group replaces the term Joint Coordination Group described in the *NRP*. The JFO is led by the Unified Coordination Group, which is comprised of specified senior leaders representing State and Federal interests, and in certain circumstances tribal governments, local jurisdictions, the private sector, or NGOs." (**DHS**, *NRF FAQs*, Jan 2008, 6)

Unified Coordination Group (UCG): "The Unified Coordination Group leads the JFO. The Unified Coordination Group typically consists of the FCO, SCO, and senior officials from other entities with primary statutory or jurisdictional responsibility and significant operational responsibility for an aspect of an incident. This group may meet initially via conference calls to develop a common set of objectives and a unified action plan to meet them." (**DHS,** *National Response Framework: Stafford Act Support to States*, July 27, 2007, p. 1)

Unified Coordination Staff: "The JFO structure normally includes a Unified Coordination Staff. The Unified Coordination Group determines the extent of staffing based on the type and magnitude of the incident. (See the JFO Standard Operating Procedure for further details on these and other Federal staff positions supporting the field operation.) (**DHS**, *NRF Comment Draft*, September 2007, p. 66)

Unified Defense Exercise: In Jan. 2004, the men and women of USNORTHCOM supported interagency efforts to deter and defeat any possible threats against persons attending the Super Bowl. The following month, USNORTHCOM conducted Exercise Unified Defense 04. This major exercise allowed the USNORTHCOM, Fifth Army, Joint Task Force Alaska and associated units to practice the homeland defense and defense support to civil authorities missions. Unified Defense 04 involved the Department of Homeland Security and more than 50 federal, state and local organizations primarily in Texas, Alaska, Colorado, Virginia and the National Capital Region." (**USNORTHCOM**, *US Northern Command History*)

Unified Effort: "Unified Effort is the combination and integration of Federal, State, local, and tribal governments and organizations; the private sector; and international partners' operations and investments to plan, prepare, coordinate, execute, and assess those actions necessary to prevent, protect, respond, and recover from threats to the citizens, infrastructure and homeland of the United States." (**DHS**, Chapter 2, *Capstone Doctrine Pub 1 Draft*, 2008, 2)

Unified Effort: "On September 11th, 2001, moments after the Twin Towers fell, and the Pentagon burned, and the passengers of Flight 93 made their heroic goodbyes, we knew that another challenge was upon us, and that a unified effort was key to our security. And so, fear and frustration from that day turned quickly to resolve and resolve turned into action. The protection of our people became the highest charge of our Nation. We moved quickly to shore up vulnerabilities that were uncovered on that tragic day--and to prevent others from being uncovered in the future." (**DHS**, *Remarks…*[DHS Sec.] *Ridge at…Port of Portland*, 4May04)

Unified Incident Management: "*Unified Command:* Also referred to as Unified Incident Management. An application of ICS/IMS used when there is more than one agency with incident jurisdiction. Agencies work together through their designated Incident Commanders or Managers at a single location to establish a common set of objectives and strategies, and a single incident action plan." (**HHS**, *Medical Surge Capacity and Capability Handbook*, 2004, p. 2-12)

Unified Joint Command (UJC): "U.S. Central Command (CENTCOM) is a "unified joint command," which has developed from the concept of the Rapid Reaction Task Force initiated by President Ronald Reagan. Central Command is under the direct command of only three men: U.S. President George W. Bush, the Secretary of Defense Donald Rumsfeld, and General Tommy Franks." (2003)

Unified Joint Command (UJC): A construct for a multi-state response. "The chain of command changes…once the Joint Field Office stands up and a Unified Command is established with the state. It takes about three to five days from initial deployment to the establishment of a *fully operational Joint Field Office*. At this point, the Joint Field Offices are in charge of field operations for their respective states and report directly to the Unified Joint Command (UJC)…and the regions convert to a role of support and coordination.

"The UJC serves as a Multiagency Coordination (MAC) Group to support all JFOs conducting earthquake response and recovery operations. Under this architecture, a Joint Field Office (JFO) is established in each impacted state that receives a presidential disaster declaration. The UJC is established in one state, most likely the hardest hit. The UJC will provide direction and control for Federal operations for the entire affected area. Other characteristics:

- Each affected state will have a representative in the UJC.
- Resource allocation and adjudication for the incident is conducted at the UJC.
- All JFOs involved in the incident will report directly to the UJC.
- The UJC senior Federal official—most likely a Principal Federal Official—reports to the FEMA Administrator.

- Regions are responsible for financial management for their assigned states and, otherwise, have a supporting/coordination role. (**FEMA**, *Federal Interim Contingency Plan – Predecisional Draft: New Madrid Seismic Zone*, December 2007, p. 18)

Unit (ICS): "The organizational element having functional responsibility for a specific incident within Planning, Logistics, or Finance/Administration." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 59)

United Nations Department of Humanitarian Affairs: "The United Nations Department of Humanitarian Affairs, established with General Assembly resolution 46/182, was created to 'mobilize and coordinate the collective efforts of the international community, in particular those of the UN system, to meet in a coherent and timely manner the needs of those exposed to human suffering and material destruction in disasters and emergencies. This involves reducing vulnerability, promoting solutions to root causes and facilitating the smooth transition from relief to rehabilitation and development'." (**UN DHA**, 1996)

United Nations Development Programme, Bureau for Crisis Prevention and Recovery: "As mandated by the UN General Assembly, within its broad development mandate the United Nations Development Programme (UNDP) works in areas where natural disasters and violent conflicts undermine sustainable development. The Bureau for Crisis Prevention and Recovery (BCPR) supports efforts to reduce the impact of natural disasters, prevent armed conflicts, and assist in recovery from crises when they occur. BCPR is also responsible for consolidating UNDP's crisis prevention and recovery knowledge and experience, providing a bridge between humanitarian response and the development work of UNDP, and advocating for crisis sensitivity in the context of development policy. In 2001, UNDP's Executive Board strengthened the work of UNDP in crisis situations by creating the Bureau for Crisis Prevention and Recovery (BCPR). One of nine bureaux, BCPR serves as the practice leader for crisis prevention and recovery within UNDP. A repository for tools, methods, and experience, BCPR supports country offices and advises UNDP Senior Management on issues related to conflict prevention and recovery, natural disaster risk reduction and recovery, and cross-cutting issues, such as early recovery and gender equality." (**UNDP BCPR**, *UNDP BCPR Objective of BCPR*, October 15, 2007, p. 1)

United Nations Framework Convention on Climate Change (UNFCCC, 1994): "In 1994, 191 countries signed up to the *UNFCCC* agreeing to both consider what could be done to reduce global warming and to cope with whatever temperature increases are inevitable. The Convention notes that Parties should take what ever actions are necessary, i.e. funding, insurance and the transfer of technology, to meet the specific needs and concerns of developing countries who will have to cope with the adverse effects of climate change especially countries with areas prone to natural disasters (article 4: Commitments, paragraph 8)." (**WWF**, *Natural Security*, 2008, 104)

United Nations International Strategy for Disaster Reduction (ISDR): "The ISDR aims at building disaster resilient communities by promoting increased awareness of the importance of disaster reduction as an integral component of sustainable development, with the goal of reducing human, social, economic and environmental losses due to natural hazards and related technological and environmental disasters. Recognizing that natural hazards can threaten any one of us, the ISDR builds on partnerships and takes a global approach to disaster reduction,

seeking to involve every individual and every community towards the goals of reducing the loss of lives, the socio-economic setbacks and the environmental damages caused by natural hazards. In order to achieve these goals, the ISDR promotes four objectives as tools towards reaching disaster reduction for all:

Increase public awareness to understand risk, vulnerability and disaster reduction globally:
The more people, regional organizations, governments, non-governmental organizations, United Nations entities, representatives of civil society and others know about risk, vulnerability and how to manage the impacts of natural hazards, the more disaster reduction measures will be implemented in all sectors of society. Prevention begins with information.
Obtain commitment from public authorities to implement disaster reduction policies and actions:
The more decision-makers at all levels commit themselves to disaster reduction policies and actions, the sooner communities vulnerable to natural disasters will benefit from applied disaster reduction policies and actions. This requires, in part, a grassroots approach whereby communities at risk are fully informed and participate in risk management initiatives.
Stimulate interdisciplinary and intersectoral partnerships, including the expansion of risk reduction networks:
The more entities active in disaster reduction share information on their research and practices, the more useful the global body of knowledge and experience will progress. By sharing a common purpose and through collaborative efforts we can ensure a world that is more resilient to the impact of natural hazards.
Improve scientific knowledge about disaster reduction:
The more we know about the causes and consequences of natural hazards and related technological and environmental disasters on societies, the more we are able to be better prepared to reduce risks. Bringing the scientific community and policy makers together allows them to contribute to and complement each other's work." (**UNISDR**, *Mission, Objectives*, 2007)

UNISDR: United Nations International Strategy for Disaster Reduction.

UNISDR CADRI: United Nations International Strategy for Disaster Reduction, Capacity for Disaster Reduction Initiative.

United Nations Office for Coordination of Humanitarian Affairs: "In December 1991, the General Assembly adopted Resolution 46/182, designed to strengthen the United Nation's response to both complex emergencies and natural disasters. In addition it aimed at improving the overall effectiveness of the UN's humanitarian operations in the field. The resolution also created the high level position of Emergency Relief Coordinator (ERC). This new function would combine into a single UN focal point the functions carried out by representatives of the Secretary-General for major and complex emergencies, as well as the UN's natural disaster functions carried out by the UN Disaster Relief Coordinator, UNDRO. Soon after, the Secretary-General established the Department of Humanitarian Affairs (DHA) and assigned the ERC the status of Under-Secretary-General (USG) for Humanitarian Affairs with offices in New York and Geneva to provide institutional support. Resolution 46/182 also created the Inter-Agency Standing Committee (IASC), the Consolidated Appeals Process (CAP) and the Central Emergency Revolving Fund (CERF) as key coordination mechanisms and tools of the ERC.

As part of the Secretary-General's programme of reform in 1998, DHA was reorganized into the Office for the Coordination of Humanitarian Affairs, OCHA. Its mandate was expanded to include the coordination of humanitarian response, policy development and humanitarian advocacy. OCHA carries out its coordination function primarily through the Inter-Agency Standing Committee, which is chaired by the ERC. Participants include all humanitarian partners, from UN agencies, funds and programmes to the Red Cross Movement and NGOs. The IASC ensures inter-agency decision-making in response to complex emergencies. These responses include needs assessments, consolidated appeals, field coordination arrangements and the development of humanitarian policies." (**UN OCHA**, *A Brief History of OCHA*, 2007, p. 1)

United States Civil Defense Corps: "…civil defense responsibility is shared at the Federal, State, and local levels. The Congress provided a civil defense structure at each of these three levels of government, giving it the collective name of 'United States Civil Defense Corps'." (**FCDA,** *1953 Annual Report*, p. 23)

United States Computer Emergency Readiness Team (US-CERT) DHS. See Department of Homeland Security, US-CERT.

United States Department of Agriculture (USDA): "USDA serves as the primary support agency to DHS/FEMA for disaster relief and CM for firefighting and food. USDA manages and coordinates firefighting activities by providing personnel, equipment, and supplies in support of state and local agencies involved in firefighting operations. During major disasters and emergencies, USDA is responsible for identifying food assistance required, securing needed supplies, and arranging for the transportation of food assistance to affected areas requiring emergency rations." (**JCS/DoD**, *Homeland Security* (JP 3-26), 2005, p. 2-21)

United States Fire Administration: "As an entity of the Department of Homeland Security's Federal Emergency Management Agency, the mission of the USFA is to reduce life and economic losses due to fire and related emergencies, through leadership, advocacy, coordination and support. We serve the Nation independently, in coordination with other Federal agencies, and in partnership with fire protection and emergency service communities. With a commitment to excellence, we provide public education, training, technology, and data initiatives." (**FEMA** *About the USFA*)

The U.S. Fire Administration (USFA) was created in 1974 in response to a bleak assessment of fire safety in the United States. The report detailed the loss of nearly 12,000 citizens and 250 firefighters to fires each year. Through firefighter training, public fire-safety education and research, the USFA cut fire-related deaths in half by 1998.

United States Intelligence Community: "A federation of executive branch agencies and organizations that work separately and together to conduct intelligence activities necessary for the conduct of foreign relations and the protection of the national security of the United States. The US Intelligence Community functions as a single corporate enterprise, supporting those who manage the nation's strategic interests – political, economic, and military. The US Intelligence Community is comprised of the following sixteen (16) entities:

- Central Intelligence Agency
- Federal Bureau of Investigation
- National Security Agency
- National Reconnaissance Office
- National Geospatial Intelligence Agency
- Department of State
- Department of Homeland Security
- Department of Energy
- Defense Intelligence Agency
- Army
- Air Force
- Navy
- Marines
- Coast Guard
- Department of Treasury
- Drug Enforcement Administration." (**FEMA**, *IIFOG Version 3 Draft*, Feb 2008, 41)

United States Northern Command. See USNORTHCOM.

Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism (Patriot) Act of 2001.

Unity of Command: "The concept by which each person within an organization reports to one and only one designated person." (**Capital Health Region**, Edmonton Canada, *ICS Training SM*, 2007, 59)

Unity of Command: "Unity of command, by which we mean the direction of the efforts of all military forces by one government official, is a time-honored principle of military doctrine. However, no mechanism has been established to permit a governor to direct within his or her state the unified efforts of all military forces that are responding to domestic contingencies. In a catastrophe, this lack could lead to confusion, wasted efforts, and loss of life and property." (**Commission on the National Guard and Reserves**, *Transforming the National Guard and Reserves into a 21st Century Operational Force,* 31Jan08, p. 14)

Unity of Command: "Unity of command means that every individual has a designated supervisor to whom they report at the scene of the incident. These principles clarify reporting relationships and eliminate the confusion caused by multiple, conflicting directives. Incident managers at all levels must be able to control the actions of all personnel under their supervision." (**DHS**, *National Incident Management System*, 2004, p. 11)

Unity of Command: "Concepts of "command" and "unity of command" have distinct legal and cultural meanings for military forces and military operations. For Federal military forces, command runs from the President to the Secretary of Defense to the Commander of the combatant command to the DOD on-scene commander. Military forces will always remain under the operational and administrative control of the military chain of command, and these forces are subject to redirection or recall at any time. The ICS "unified command" concept is distinct from

the military chain of command use of this term. And, as such, military forces do not operate under the command of the Incident Commander or under the unified command structure." (**DHS**, *NRF*, Jan 2008, 11)

Unity of Command: "Each individual involved in incident operations will be assigned to only one supervisor." (**FEMA**, *National Incident Management System Draft*, August 2007. p. 160)

Unity of Effort: "Unity of effort requires that strategies, plans, operations, and future technologies be closely coordinated with partners. We must work as part of a unified interagency team to address threats and to support other agencies in complex interagency operations." (**Castle**, "Supporting Homeland Partners," *JFQ*, Issue 8, 1st Quarter 2008, p. 45)

Unity of Effort: "…respects the chain of command of each participating organization while harnessing seamless coordination across jurisdictions in support of common objectives." (**DHS**, *NRF Comment Draft*, September 2007, p.10)

Unity of Effort Through Unified Command – 4th of Five Key NRF Principles: "Effective *unified command* is indispensable to response activities and requires a clear understanding of the roles and responsibilities of each participating organization. Success requires *unity of effort,* which respects the chain of command of each participating organization while harnessing seamless coordination across jurisdictions in support of common objectives. Use of the Incident Command System (ICS) is an important element across multijurisdictional or multiagency incident management activities. It provides a structure to enable agencies with different legal, jurisdictional, and functional responsibilities to coordinate, plan, and interact effectively on scene. As a team effort, unified command allows all agencies with jurisdictional authority and/or functional responsibility for the incident to provide joint support through mutually developed incident objectives and strategies established at the command level. Each participating agency maintains its own authority, responsibility, and accountability. This *Framework* employs the *NIMS* standardized structures and tools that enable a unified approach to be effective both on scene and at the emergency operations centers." (**DHS**, *NRF*, Jan 2008, pp. 10-11)

Universal Adversary (UA): "The UA is a fictionalized adversary created by compiling known terrorist motivations, doctrine, tactics, techniques, and procedures (TTPs) in live, virtual, and constructive simulations. The UA is based on realistic threats, but it is designed not to compromise actual intelligence. The UA will be utilized for DHS-sponsored exercises, providing participants with a realistic, capabilities-based opponent. Prevention exercises will employ an adaptable, threat-based UA, in some cases represented by physical Red Teams or analytical opponents. The UA reflects real-world uncertainties and unpredictability, and evolving terrorist TTPs. The UA is currently broken into the following five threat groups currently faced by the U.S. within our borders:

> • **The Anti-Globalization Movement** is mostly non-violent, but some anarchist groups and more extreme activists have used violence. The national Memorial Institute for the Prevention of Terrorism (MIPT) has catalogued and attributed 70 terrorist events to Anti-Globalization groups from 1998 through 2004, none of which took place in the United States. The Anti-Globalization movement emerged throughout the 1990s and became a serious security threat, as tens of thousands of demonstrators protested Great Eight (G8)

Economic Summit in Cologne, the World Trade Organization (WTO) in Seattle, and the International Monetary Fund (IMF) / World Bank in Washington. Police were unprepared for the number of protesters, and unprepared for how well they were organized. While people demonstrated in the streets, companies were suffering thousands of cyberattacks. This mobilization, the sophistication of organization, and highly technical cyber skills overwhelmed law enforcement and security personnel.

• **Domestic Right Wing Extremism**, racist, white-power groups, along with militias, have grown in size and prominence throughout the United States. The number of groups is rising, but the top groups were in decline in 2004. MIPT attributes no terrorist events to Domestic Right Wing groups from 1998 through 2004. The violence perpetrated has been mostly criminal and harassment in nature – vandalism, propaganda fliers, and the occasional physical assault. These attacks are not carried out by groups, but by random individuals inspired by groups' rhetoric. The Southern Poverty Law Center's Intelligence Project counted 762 active hate groups and 152 active Patriot groups in 2004.

• **The Environmental / Animal Rights Movement** has emerged as a serious domestic terrorist threat. Various sources have catalogued and attributed 133 terrorist events to Environmental / Animal Rights groups from 1998 through mid-April 2005. Extremists target government agencies, private companies, academic research institutes, and the individuals associated with all three, in direct action to stop animal suffering,4 or to stop the exploitation and destruction of the natural environment.5 More recent attacks have targeted "sprawl."6 Two domestic Environmental / Animal Rights groups are designated as terrorist organizations. The Earth Liberation Front (ELF) and the Animal Liberation Front (ALF) are partner organizations in an increasingly violent Environmental / Animal Rights movement. Neither group has a central leader, central location, or a defined organization. There is no official membership. An individual is considered a member of ELF or ALF based on their belief in the central ideology and their actions.

- **The Global Salafist Jihad (GSJ) Movement** is the predominant threat to the United States. GSJ groups are nontraditional terrorist adversaries driven by a common idea and motivation. It is a movement in which al Qaeda ideologues like bin Laden, al-Zawahiri drive followers to pursue physical jihad. Various sources have catalogued and attributed 225 terrorist events to GSJ groups from 1998 through 2004. Bombings accounted for 141 of these attacks. The second and third most common tactics are Armed Attacks and Kidnappings. Bombings and explosions far outweigh other forms of GSJ groups' attacks, and are happening more frequently and in higher numbers. VBIEDs and IEDs were used in most bomb/explosives attacks.

• **The Lone Actor / Small Group** is a serious threat to United States countermeasures and intelligence capabilities. Acting alone defies infiltration, intervention, or intelligence collection. Various sources have catalogued and attributed 43 terrorist events to Lone Actors or Small Groups from 1998 through 2004. Biological Agents accounted for 14 of the 43 attacks. The second most common attacks are Bombings, accounting for nine attacks, and the third most common attacks are Armed Attacks, with seven." (**DHS**, *HSEEP*, Vol. V, 2005, pp. 11-12)

Universal Task List: "…a menu of some 1,600 unique tasks that can facilitate efforts to prevent, protect against, respond to and recover from the major events that are represented by the National Planning Scenarios. It presents a common vocabulary and identifies key tasks that support development of essential capabilities among organizations at all levels. Of course, no entity will perform every task. Instead, this task list was used to assist in creating the Target Capabilities List." (**DHS**, *NRF Comment Draft*, September 2007, p. 10)

Universal Task List: "The Universal Task List (UTL) is a list of every unique task that was identified from the suite of Common Scenarios developed under the leadership of the Homeland Security Council. The fifteen scenarios address a range of probable threats from terrorists, natural disasters and other emergencies." (**DHS**, *Universal Task List*, **July 2004** Draft, Cover)

Universal Task List: "The Universal Task List (UTL) is an important tool in the Capabilities-Based Planning process being implemented under Homeland Security Presidential Directive 8: National Preparedness by Office for Domestic Preparedness, U.S. Department of Homeland Security. Fifteen National Planning Scenarios (key risk scenarios), developed under the leadership of the Homeland Security Council, are being used as planning tools to define the nature and scope of incidents for which we must prepare. The scenarios were used to define the tasks that need to be performed at every level of government to prevent, respond to, and recover from large-scale incidents. Nationally representative teams identified tasks based on criticality. Most of the tasks identified through the scenario analysis are common across scenarios. All *unique* tasks have been combined into a menu called the UTL. It defines all the tasks that need to be performed by someone in response to an Incident of National Significance, but no single jurisdiction or agency would be expected to perform every task. Subsets of tasks are selected based on specific roles, missions and functions. They serve as the foundation for learning and exercise objectives, as well as for operational planning, evaluations and assessments of performance. The UTL will continue to be refined and expanded as additional activities are addressed, to include those performed by the private sector." (**DHS**, *UTL 2.0*, **Dec 2004**, p. iii)

Universal Task List: "The Universal Task List (UTL) defines what tasks need to be performed by Federal, State, local, and tribal jurisdictions and the private sector to prevent, protect against, respond to, and recover from events defined in the National Planning Scenarios. Version 2.1 identifies approximately 1,600 unique tasks. The UTL is the basis for defining the capabilities found in the Target Capabilities List (TCL) that are needed to perform the full range of tasks required to prevent, protect against, respond to, and recover from incidents of national significance. The fully developed UTL and TCL will provide officials at all levels with a framework for assessing their overall level of preparedness, while targeting resources to address their greatest needs." (**DHS**, *TCL*, **2005** (Version 2.1), p. 2)

Universal Task List: "The Universal Task List (UTL) helps us answer the question: What do we need to do to prevent, protect against, respond to, and recover from threats? The UTL

- Identifies tasks that must be performed
- Defines task interdependence and interrelationship
- Does NOT address how or who performs task

- Provides common language and reference
- Approximately 4,800 tasks." (**FEMA**, *National Preparedness System: Current Prototype & Proposed Implementation Approach*, August 2, 2007, slide 8)

Universal Task List. Common Tasks: "Common tasks are those tasks that cut across the mission areas. They must be performed to achieve more than one or all of the missions. For example, the common tasks include broad planning, coordination, training, and communication tasks…. The common tasks have been grouped into the following functions:

A) Preparedness
B) Resource Management
C) Communications and Information Management
D) Supporting technology" (**DHS**, *UTL 2.1*, 2005, p. 7)

University Affiliate Centers to the Institute for Discrete Sciences (IDS-UACs): A Department of Homeland Security funded Center of Excellence "led by Rutgers University, the University of Southern California, the University of Illinois at Urbana-Champaign, and the University of Pittsburgh. They collaborate with IDS, based at Lawrence Livermore National Laboratory, to conduct research on advanced methods for information analysis and the development of computational technologies to protect the Nation." (**DHS**, *Homeland Security Centers of Excellence*, 20March07)

UNOCHA: United Nations Office for the Coordination of Humanitarian Affairs

Unsolicited Donated Goods: "…the spontaneous outpouring of donated things from individual Americans seeking to respond to media reports of a disaster…. In this guide, we use the term "material donation" to refer to donations of "things," as opposed to cash. Material donations, sometimes referred to as "Gifts In Kind," could consist of any new or used item that is donated to a relief effort." (**InterAction**, *Guide to Appropriate Giving*, 2002)

Urban Analysis Program, FCDA: "To develop effective local operational plans for civil defense in the event of enemy attack, FCDA, prior to the advent of the survival plan studies, provided guidance and encouraged important target areas to make thorough analyses of items such as the most probable target areas, probable damage and casualties, population distribution, industrial installations, communications, transportation systems, evacuation routes, power and water facilities, medical resources, hospitals, schools, jails, zoons, fire-fighting plans, potential assembly areas, feeding and welfare facilities, topography, prevailing winds, possible shelters, and many other items….A total of 46 areas has undertaken such analyses." (**FCDA**, *1956 Annual Report*, 1957, pp. 27-28)

Urban Area Security Initiative (UASI): "In July 2002 the President approved the *National Strategy for Homeland Security*, a road map for the national effort to prevent and respond to acts of terrorism in the United States. The *National Strategy* recognizes the vital role of state and local public safety agencies in providing for the security of our homeland. In February 2003 the President signed into law the Fiscal Year (FY) 2003 Omnibus Appropriations Act which

provides state and local governments with the vital funding they require to participate in the national effort to combat terrorism.

'The U.S. Department of Homeland Security (DHS), Office for Domestic Preparedness (ODP) FY 2003 Urban Areas Security Initiative (UASI) reflects a confluence of important Presidential initiatives designed to enhance the preparedness of the nation to combat terrorism. Whereas most states and municipalities have strengthened their overall capability to respond to acts of terrorism involving chemical, biological, radiological, nuclear or explosive (CBRNE) weapons, there continues to be room for improvement in meeting our national priorities of preventing and responding to terrorist attacks.

"The Office for Domestic Preparedness is providing financial assistance directly to selected jurisdictions through the Fiscal Year (FY) 2003 Urban Areas Security Initiative. This financial assistance is being provided to address the unique equipment, training, planning and exercise needs of large high threat urban areas, and to assist them in building an enhanced and sustainable capacity to prevent, respond to, and recover from threats or acts of terrorism." (**DHS** (DHS Secretary Tom Ridge Forward to FY 2003 UASI Grant Application)

"UASI funding remains primarily focused on enhancing capabilities to address CBRNE, agriculture, and cyber-terrorism incidents; however, in support of national ongoing preparedness initiatives addressing such issues as pandemic influenza and the aftermath of Hurricane Katrina, the allowable scope of UASI Program activities was expanded in FY 2006 to include Catastrophic events, provided that these activities also build capabilities that relate to terrorism. Program Participants may use UASI funding to achieve or enhance all of the 37 target capabilities, as long as they enhance the capability to prevent, protect against, respond to, or recover from acts of terrorism. UASI Program award amounts are determined based on a risk- and effectiveness-based approach. The grant guidance suggests that Urban Areas take an inclusive regional approach and involve contiguous jurisdictions, mutual aid partners, port authorities, rail and transit authorities, State agencies, Citizen Corps Council(s), and Metropolitan Medical Response System(s) (MMRS) in their program activities. Each State develops an Investment Justification detailing the projects they wish to use UASI Program funding to implement. Proposed Investments under the UASI Program should focus on the National Priorities and the most urgent State/local priorities. The UASI Program…has…grown to include 58 urban areas." (**DHS**, *UASI Fact Sheet*, June 2006 Revision, p. 1)

Urban Area Security Initiative (UASI) Grants: "The Urban Area Security Initiative (UASI) addresses the unique multi-disciplinary planning, operations, equipment, training, and exercise needs of high-threat, high-density urban areas, and assists them in building and sustaining capabilities to prevent, protect against, respond to, and recover from threats or acts of terrorism. This program provides funding to high-risk urban areas based on risk and effectiveness. In FY 2008, program participants may use UASI funding to achieve or enhance all of the 37 capabilities outlined in National Preparedness Guidelines and Target Capabilities List, as long as they enhance the capability to prevent, protect against, respond to, or recover from acts of terrorism. Proposed Investments under the UASI program should focus on the National

Priorities and the most urgent state/local priorities." (**FEMA**, *Statement of R. David Paulison, Administrator, on the Fiscal Year 2009 President's Budget Before the Committee on Appropriations Subcommittee on Homeland Security, House of Representatives*, 11Mar08, p. 4)

Urban Area Working Group (UAWG). The UAWG acts "as an executive steering committee to provide overall governance of the homeland security program across the regional area encompassed within the defined urban area. Responsibilities of the UAWG include coordinating development and implementation of all program initiatives (including development of the Urban Area Homeland Security Strategy, investment identification and justification, funding allocation methodologies, in cooperation with the SSA, and any direct services that are delivered by G&T). The UAWG is also responsible for ensuring that all programmatic requirements associated with participation in the UASI Program are fulfilled." (**DHS**, *UASI Fact Sheet*, June 2006, p. 2)

Urban Areas: "…the term "urban areas" refers to the 55 Fiscal Year 2005 Urban Areas Security Initiative program grantees and the 20 major cities selected for the Nationwide Plan Review by DHS based on an analysis of 2004 population, risk, and need." (**DHS**, *NPR Phase 2 Report*, 2006, p. vii)

Urban Areas Security Initiative (UASI): See Urban Area Security Initiative.

Urban Search and Rescue (US&R): "Urban search-and-rescue (US&R) involves the location, rescue (extrication), and initial medical stabilization of victims trapped in confined spaces. Structural collapse is most often the cause of victims being trapped, but victims may also be trapped in transportation accidents, mines and collapsed trenches." (**FEMA**, *Urban Search-and-Rescue (US&R)*, February 28, 2007 update)

Urban Search and Rescue Response System (US&R) Operational Readiness Evaluations: "In order to ensure the efficiency and operational readiness of each task force, FEMA has developed an Operational Readiness Evaluation Process. This program provides for a thorough on-site inspection of all task force components to determine the general readiness of the task force to respond and operate on the scene of a disaster. The objectives of the process include:

- Provide a uniform method to determine the current operational readiness levels of all task forces participating in the National US&R Response System.
- Identify major strengths and shortfalls in the current and planned system of task force development.
- Develop a fair and objective process that can be conducted by local program management, State officials, FEMA, and sponsoring organizations to determine readiness levels.
- Provide feedback to the respective task force regarding the strengths and weaknesses for inclusion into a plan of action for further development and improvement.

"Periodically, a cadre of peer evaluators from other task forces will make an on-site visit to each task force's sponsoring agency. The cadre will compare team equipment with the approved cache list, as well as review legal agreements, administrative documentation, financial records, personnel qualifications, and task force training records. The results of the evaluation are submitted to FEMA Headquarters as part of the task force's permanent record and used to

determine if the task force is operationally certified for a mission assignment." (FEMA, *Urban Search and Rescue Response System In Federal Disaster Operations* (Draft) January 2000)

Urban Search and Rescue (US&R) Task Forces: "The National US&R Response System is a framework for structuring local emergency services personnel into integrated disaster response task forces. The 28 National US&R Task Forces, complete with the necessary tools, equipment, skills and techniques, can be deployed by DHS/FEMA to assist State and local governments in rescuing victims of structural collapse incidents or to assist in other search and rescue missions. Each task force must have all its personnel and equipment at the embarkation point within 6 hours of activation. A task force can be dispatched and en route to its destination in a matter of hours." (**DHS**, *NRF -- Federal Partner Guide* (Comment Draft). September 10, 2007, p. 9)

Urban/Wildland Interface: "A developed area, also known as the "I-zone," occupying the boundary between an urban or settled area and a wildland characterized by vegetation that can serve as fuel for a forest fire." (**APA**, *Planning For A Disaster*…, 2005, p. 85)

URMIA: University Risk Management and Insurance Association.

U.S. Commission on National Security/21st Century (Hart-Rudman Commission): "The "Hart-Rudman Commission was chartered to review U.S. national security requirements for the next century. The Commission's Report, published in September 1999, warned that, in the course of the next quarter century, terrorist acts involving weapons of mass destruction were likely to increase. 'Americans will likely die on American soil, possibly in large numbers,' it said." (**NAPA**, *Addressing the 2009 Presidential Transition at…DHS*, May 2008 Agency Review Draft, p. 9)

USA Patriot Act of 2001, 24 October 2001. "This act enhances domestic security against terrorism. It eases some of the restrictions on foreign intelligence gathering within the US and affords the US intelligence community greater access to information discovered during a criminal investigation." (**JCS/DoD**, *Homeland Security* (JP 3-26), 2005, p. A-4)

USACE: United States Army Corps of Engineers.

USAID OFDA: U.S. Agency for International Development, Office of Foreign Disaster Assistance.

USAonWatch: Incorporated terrorism awareness education into its existing crime prevention mission on Neighborhood watch. (**Citizen Corps**, *Citizen Corps Uniting Communities, Preparing the Nation*. DHS, slide presentation, slide 6)

USAR: United States Army Reserves. (**DA**, *WMD-CST Operations*, Dec. 2007, Glossary-7)

USAR: Urban Search and Rescue. (**HSGAC**, *Katrina:* A *Nation Still Unprepared*, 2006, 634)

US-CERT: United States Computer Emergency Readiness Team. (**DHS,** *NIPP*, 2006, p. 102)

US-CERT Operations (United States Computer Emergency Readiness Team): "US-CERT is responsible for analyzing and reducing cyber threats and vulnerabilities, disseminating cyber threat warning information, and coordinating incident response activities." (**DHS**, *National Cyber Security Division*, 23Sep06 modification)

USCG: United States Coast Guard. See Department of Homeland Security, USCG.

USDOJ: United States Department of Justice.

US&R: Urban Search and Rescue.

USFA: United States Fire Administration, FEMA/DHS, Emmitsburg, MD.

USFS: U.S. Forest Service.

USG: United States Government.

USGS: United States Geological Survey.

USMTF: U.S. Message Text Format. (**DA**, *WMD-CST Operations*, Dec.2007, Glossary-7)

USNORTHCOM (United States Northern Command): "U.S. Northern Command (USNORTHCOM) was established Oct. 1, 2002 to provide command and control of Department of Defense (DoD) homeland defense efforts and to coordinate defense support of civil authorities. USNORTHCOM defends America's homeland — protecting our people, national power, and freedom of action…. USNORTHCOM's AOR includes air, land and sea approaches and encompasses the continental United States, Alaska, Canada, Mexico and the surrounding water out to approximately 500 nautical miles. It also includes the Gulf of Mexico and the Straits of Florida. The defense of Hawaii and our territories and possessions in the Pacific is the responsibility of U.S. Pacific Command. The defense of Puerto Rico and the U.S. Virgin Islands is the responsibility of U.S. Southern Command. The commander of USNORTHCOM is responsible for theater security cooperation with Canada and Mexico. USNORTHCOM consolidates under a single unified command existing missions that were previously executed by other DoD organizations. This provides unity of command, which is critical to mission accomplishment. USNORTHCOM plans, organizes and executes homeland defense and civil support missions, but has few permanently assigned forces. The command is assigned forces whenever necessary to execute missions, as ordered by the president and secretary of defense. Civil service employees and uniformed members representing all service branches work at USNORTHCOM's headquarters located at Peterson Air Force Base in Colorado Springs, Colo. The commander of USNORTHCOM also commands the North American Aerospace Defense Command (NORAD), a bi-national command responsible for aerospace warning and aerospace control for Canada, Alaska and the continental United States.

"USNORTHCOM's civil support mission includes domestic disaster relief operations that occur during fires, hurricanes, floods and earthquakes. Support also includes counter-drug operations and managing the consequences of a terrorist event employing a weapon of mass destruction.

The command provides assistance to a Lead Agency when tasked by DoD. Per the Posse Comitatus Act, military forces can provide civil support, but cannot become directly involved in law enforcement. In providing civil support, USNORTHCOM generally operates through established Joint Task Forces subordinate to the command. An emergency must exceed the capabilities of local, state and federal agencies before USNORTHCOM becomes involved. In most cases, support will be limited, localized and specific. When the scope of the disaster is reduced to the point that the Lead Agency can again assume full control and management without military assistance, USNORTHCOM will exit, leaving the on-scene experts to finish the job." (**USNORTHCOM**, *About USNORTHCOM*)

USNORTHCOM Command Assessment Element (CAE): "rapidly deployable, tailored package that gives the NORTHCOM Commander operational and tactical level awareness of the operating environment and assessments of needs. The CAE gathers information, develops situational awareness, and conducts assessments with State and local officials." (FEMA, *Statement of Glen Cannon*, November 15, 2007, p. 11)

USNORTHCOM Mission Statement: "Conduct operations to deter, prevent, and defeat threats and aggression aimed at the United States, its territories, and interests within the assigned area of responsibility; and as directed by the President or Secretary of Defense, provide defense support of civil authorities including consequence management operations." (**Keating**, *CDRNORAD-CDRUSNORTHCOM Strategic Guidance*, November 1, 2006, p. 2)

USNORTHCOM Strategic Goals and Objectives:

"Goal *1*: Detect, deter, prevent, and defeat external threats and aggression….
Goal 2: Provide timely and effective defense support of civil authorities….

- Objective 2.1 – Anticipate requests for civil support
- Objective 2.2 – Provide military capabilities at the right place and right time
- Objective 2.3 – Maintain flexible, executable, rapidly adaptable, and regularly-exercised plans
- Objective 2.4 – Support efforts to improve capabilities of mission partners
- Objective 2.5 – Enhance interoperability and information sharing with mission partners

Goal 3: Improve unity of effort with our interagency and international partners…." (**Keating**, *CDRNORAD-CDRUSNORTHCOM Strategic Guidance*, November 1, 2006, pp. 6-8)

USNORTHCOM Supporting and Support Relationship with State Governments: "I want to spend a moment talking about that supporting and supported relationship.

"One of the other elements of our mission at USNORTHCOM is a state engagement program. We feel it is very important to spend a lot of time out on the road…preaching the gospel…of USNORTHCOM's role in our nation's defense, in support of civil authorities, and to support elements of homeland security.

"Our goal is to get to every governor and every state adjutant general and every emergency management director… the message is we are here to support the needs of the Nation; we are here to support the requirements of a state when they're in trouble, when a disaster strikes or

when they have a unique security event occurring….our role is to create those capacities ahead of time so that when a state has a need, they don't have to decide that they're in trouble and then make a call and go through the administrative process and then, a week later, the support shows up. If you look at how we prepared for Hurricane Dean just a few weeks ago when we thought a Category Five hurricane was going to hit Harlingen, Texas, we had people in place well before the event occurred, well before it turned south and began its movement towards Mexico. And they were there to prepare medical evacuation capabilities so that critical care patients could be moved out of the Harlingen and Brownsville area of Texas….so we worked very carefully with our FEMA region partners, our Defense Coordinating Officer, and the state of Texas to ensure that we knew what their needs were and that we went and found those capabilities…. So it's that kind of day-to-day interaction that we've been communicating to the governors, to the adjutants general, and to the emergency management directors of all the states.

"We're there to help them succeed. We're not there to be in charge. We're there to ensure that the Title 10 forces that come are professionally trained, equipped, disciplined, and supportive. We've done a supporting/supported relationship in our military for many years. We understand how to do that. I understand that the governor leads the effort in their state. If the people of a particular state elected a governor and then felt that that governor couldn't take care of them when disaster struck, it's a bad message. Our job is to make sure the state succeeds….And we're prepared and leaning forward to do that. I have an execute order that is signed for the hurricane season that gives me access to about 9,000 military, both in terms of assessors, responders, security forces, logistics capability, rotary-wing lift, and the like, that I can begin to move before an event even occurs. So that's authority that Tim Keating didn't have as we got to Katrina. And certainly it's that authority that we need to consider expanding as we look to the future. So that mission of engagement with the states is critical, and we continue to work on that very, very hard." (**USNORTHCOM,** *Remarks by General Gene Renuart Homeland Defense Symposium, Colorado Springs, 3 Oct 07*)

USNORTHCOM Vision: "United States Northern Command defends America's homeland—protecting our people, national power, and freedom of action." (**Keating**, *CDRNORAD-CDRUSNORTHCOM Strategic Guidance*, November 1, 2006, p. 3)

UTMOST ENDEAVOR: Unclassified code word for WMD-CST deployment and execution order. (**Dept. of the Army**, *WMD-CST Operations*, December 2007, p. 8-2)

VA: Vulnerability Assessment. (**DHS/OIG**, *Water CI/TK SSP Report*, May 2007, p. iii)

Values: "In managing the evolving requirements of preparing and securing the State of California from terrorist acts and natural disasters, OHS embraces the following values in order to accomplish its mission:

- Leadership
- Accountability
- Fairness
- Effective Partnerships
- Customer Focus
- Resourcefulness
- Teamwork
- Integrity (**CA Gov. OHS**, *State of California Homeland Security Strategy 2008*, May 2008, 2)

VDCC: Volunteer and Donation Coordination Center. (**DHS**, *TCL*, 2007, p. 248)

Vector-Borne Diseases: "Diseases spread by vectors, such as insects. Examples include the West Nile virus, Rocky Mountain spotted fever, and malaria." (**TFAH**, *Ready or Not?* 2007, 11)

Vector Control: "Measures taken to decrease the number of disease carrying organisms (vectors) and to diminish the risk of their spreading infectious diseases." (**UNDHA**, *DM Glossary*, 1992, 76)

Venue: "A venue is the primary location of exercise conduct. In *operations-based* exercises, this is typically the facility or site the *scenario* will affect. For example, if a non-persistent chemical agent (e.g., Sarin) is selected as the threat/hazard, the venue should not be an open-air facility (e.g., stadium, park) because of the agent's dissipating characteristics. (Note: The venue used to conduct the exercise does not necessarily have to be the same venue described in the exercise scenario. For example, a stadium parking lot may be used to simulate an airport runway)." (**FEMA**, *Homeland Security Exercise and Evaluation Program Glossary*, 2008)

VEOC: Virtual Emergency Operations Center.

VERT: Veternairy Emergency Response Team. (Valerie Lucus, July 14, 2008 Email)

Vertical Datum: "A vertical datum is a base measurement point (or set of points) from which all elevations are determined. Without a common datum, surveyors would calculate different elevation values for the same location. Historically, that common set of points has been the National Geodetic Vertical Datum of 1929 (NGVD29). However, as a result of advances in technology, an updated vertical datum was created and has been officially adopted by the Federal Government as a new basis for measuring heights: the North American Vertical Datum of 1988 (NAVD88). (**FEMA**, *Vertical Datum: New Mapping Studies Convert…,* July 2007)

VHF: Very High Frequency radios. (**USACE**, Response Planning Guide, 1995, p. 4-1.

Vigilant Guard: "…the Vigilant Guard Regional Exercise Program…is designed by the National Guard Bureau to train and enhance the preparedness of our state level Joint Force Headquarters and Joint Task Forces in their mission to support civilian authorities. Each Vigilant Guard exercise is designed to involve multiple States – ideally all of the States in a FEMA region. Beginning with an August 2005 exercise in Ohio, at FEMA Region 5, we have conducted seven (7) exercises thus far…. These exercises have grown from command post exercises concentrating on the Guard information management tasks to robust State and local full scale play." (**NGB**, *Statement by Major General Steven Saunders,* October 3, 2007, p. 2)

Vigilant Sentry: "Recognizing the threat and national impacts of a mass migration from the Caribbean to the U.S., DHS Secretary Tom Ridge established Homeland Security Task Force Southeast to bring the resources, skills and capabilities of all the involved agencies under one umbrella organization to develop the contingency response plan, Operation Vigilant Sentry. Once completed, this single plan would replace about a half-dozen independent plans in existence. This unification measure launched an intense and unprecedented planning process that involved people from throughout DHS and other impacted federal agencies, including the Departments of State, Defense and Justice." (**US Coast Guard Magazine**, "Operation Able Sentry," June 2004, p. 26)

Vigilant Shield Exercises: "VIGILANT SHIELD 2008 is a Chairman of the Joint Chiefs of Staff-designated, North American Aerospace Defense Command (NORAD) and U.S. Northern Command (USNORTHCOM) sponsored, and U.S. Joint Forces Command-supported Department of Defense exercise for homeland defense and defense support of civil authorities missions. Exercise VIGILANT SHIELD 2008 will be conducted concurrent with TOP OFFICIALS 4 (TOPOFF 4), the nation's premier exercise of terrorism preparedness sponsored by the Department of Homeland Security, and several other linked exercises as part of the National Level Exercise 1-08. *Purpose:* Exercise VIGILANT SHIELD 2008 and National Level Exercise 1-08 will provide local, state, tribal, interagency, Department of Defense, and nongovernmental organizations and agencies involved in homeland security and homeland defense the opportunity to participate in a full range of exercise scenarios that will better prepare participants to prevent and respond to national crises. The participating organizations will conduct a multilayered, civilian-led response to a national crisis." (**US NORTHCOM**, *Fact Sheet – Exercise Vigilant Shield 2008*, 2007)

VIPS: Volunteers in Police Service (**Citizen Corps**, *Citizen Corps Uniting Communities, Preparing the Nation*. DHS, slide presentation, slide 6)

Virtual Emergency Operation Centers (VEOCs): "A 'Virtual Emergency Operations Center' (VEOC) is an EOC that exists solely or partially in cyberspace. A VEOC provides an electronic EOC via a computer network or the Internet. It can consist of anywhere from one workstation to thousands of networked computers dispersed throughout the enterprise and around the globe. The first versions of VEOCs were simple information systems based on fixed and mobile wireless networks. Modern VEOCs utilize the latest Internet technology as well as Virtual Private Networks, and satellite communications." (**Davis Logic**, *VEOCs*, 2005)

Virtual Joint Information Center (JIC): A virtual JIC is established when a physical co-location is not feasible. It connects PIOs through e-mail, cell/land-line phones, faxes, video teleconferencing, web-based information systems, etc. For a pandemic incident where PIOs at different locations communicate and coordinate public information electronically, it may be appropriate to establish a virtual JIC. (**FEMA**, *Basic Guidance for PIOs*, Nov 2007, 16)

Vision: "An idealized statement of the best possible future." (**FEMA** *A Nation Prepared* 2002, 60)

Vision Statement: "To develop a society more resilient to natural disasters, where sustained planning, investment and action results in more sustainable communities." (**Canadian Risk and Hazards Network** 2005, 11)

Visualization: "Visualization refers to techniques that allow data to be understood by seeing patterns that are detected by statistical methods, such as pattern recognition methods, and/or simply understood by seeing how geospatial relationships look on a map [or video]." (**Altevogt**, *Research Priorities in Emergency Preparedness and Response for Public Health Sys.* 2008, 19)

Vital Records: "Electronic and hardcopy documents, references, and records that are needed to support essential functions during a continuity situation. The two basic categories of vital records are (1) emergency operating records and (2) rights and interests records." (**DHS**, *FCD 1*, Nov. 2007, P-9)

Vital Records Categories: "Categories of vital records include the following;

Emergency Operating Records. These include records and databases essential to the continued functioning or the reconstitution of an agency during and after a continuity event. Examples of these records are emergency plans and directives, orders of succession, delegations of authority, staffing assignments, and related policy or procedural records. These records provide an agency's continuity personnel with the guidance they need to conduct operations during a continuity situation and to resume normal operations at the conclusion of that situation. Agencies must identify and preposition Emergency Operating Records needed to continue essential functions.

Rights and Interests Records. These include records critical to carrying out an agency's essential legal and financial functions, and vital to the protection of the legal and financial rights of individuals who are directly affected by that agency's activities. These records include those with such value that their loss would significantly impair the execution of essential agency functions, to the detriment of the legal or financial rights and entitlements of the agency and the affected individual(s). Examples of these records are accounts receivable files; contracting and acquisition files; official personnel records; Social Security, payroll, retirement, and insurance records; and property management and inventory records. Any Rights and Interests Records considered critical for continued performance of essential functions should be included in the Emergency Operating Records and maintained at the appropriate alternate continuity facility." (**DHS**, *FCD 1*, Nov. 2007, p. I-1)

VMAT: Veterinary Medical Assistance Team. (**HSGAC**, A *Nation Still Unprepared*, 2006, 634)

VOAD: Voluntary Organizations Active in Disaster. (**HSGAC**, *Nation Unprepared*, 2006, 634)

VOIP: Voice Over Internet Protocol.

Volcanic Eruption: "The discharge (aerially explosive) of fragmentary ejecta, lava and gases from a volcanic vent." (**UNDHA**, *DM Glossary*, 1992, 76)

Volcano: "A volcano is a vent through which molten rock escapes to the earth's surface. When pressure from gases within the molten rock becomes too great, an eruption occurs. Eruptions can be quiet or explosive. There may be lava flows, flattened landscapes, poisonous gases, flying rock and ash, or landslides and mudflows. Because of their intense heat, lava flows are great fire hazards. Lava flows destroy everything in their path, but most move slowly enough that people can move out of the way. Fresh volcanic ash, made of pulverized rock, can be abrasive, acidic, gritty, gassy, and odorous. While not immediately dangerous to most adults, the acidic gas and ash can cause lung damage to small infants, to older adults, and to those suffering from severe respiratory illnesses. Volcanic ash also can damage machinery, including engines and electrical equipment. Ash accumulations mixed with water become heavy and can collapse roofs." (**FEMA**, "Fact Sheet – Volcanoes," June 2007, p.1)

Volcanic Dust: Dust of particles emitted by a volcano during an eruption. They may remain suspended in the atmosphere for long periods and be carried by the winds to different regions of the Earth. (**WMO** 1992, 662)

Voluntary Agencies: "Non-governmental agencies or organizations that exist in many countries throughout the world. Some possess personnel trained to assist when disaster strikes. Some volags have capabilities that extend from the local to national and international levels." (**UNDHA**, *DM Glossary*, 1992, 77)

Voluntary Agency Coordinator: "A designated individual who shares information with voluntary agencies about Federal and State activities, and assembles reports on voluntary Federal agency activities, during a major disaster or emergency. Each FEMA Region has a designated voluntary Federal agency coordinator." (**FEMA**, *Mission Assignment SOPs Draft*, 2007, p. 61)

Voluntary Evacuation: "This is a warning to persons within a designated area that a threat to life and property exists or is likely to exist in the immediate future. Individuals issued this type of warning or order are NOT required to evacuate, however it would be to their advantage to do so." (**FEMA**, *Guide For All-Hazard Emergency Operations Planning* (State and Local Guide (SLG) 101), September 1996, GLO-6)

Voluntary Organization: "Any charted or otherwise duly recognized tax-exempt local, State, or national organization or group which has provided or may provide needed services to the State, local governments, or individuals in coping with an emergency or a major disaster." (**FEMA**, *Mission Assignment SOPs Operating Draft*, July 2007, p. 61)

Voluntary Organizations Active in Disaster (VOAD): "An umbrella organization of voluntary agencies, organized at the State level, whose representatives meet to prepare for disasters. During the response phase of disaster operations, each individual VOAD Federal agency functions independently." (**FEMA**, *Mission Assignment SOPs Draft*, July 2007, p. 62)

Volunteer: "Any individual accepted to perform services by an agency, which has authority to accept volunteer services when the individual performs services without promise, expectation, or receipt of compensation for services performed." (**DHS**, *National Preparedness Goal*, December 2005 Draft, p. A-4; cites, *NIMS*, March 2004)

Volunteer: "For purposes of NIMS, a volunteer is any individual accepted to perform services by the lead agency (which has authority to accept volunteer services) when the individual performs services without promise, expectation, or receipt of compensation for services performed. See 16 U.S.C. 742f(c) and 29 CFR 553.101." (**FEMA**, *NIMS Draft*, Aug 2007, 160)

Volunteer Services: "There are statutory exceptions to the general statutory prohibition against accepting voluntary services under 31 U.S.C. 1342 that can be used to accept the assistance of volunteer workers. Such services may be accepted in "emergencies involving the safety of human life or the protection of property." Additionally, provisions of the Stafford Act, 42 U.S.C. 5152(a), 5170a(2), authorize the President to use the personnel of private disaster relief organizations and to coordinate their activities." (**DHS**, *NRP* (Draft #1), Feb 25, 2004, p. 71)

Volunteers (Affiliated): "*Affiliated volunteers* are attached to a recognized voluntary or nonprofit organization and are trained for specific disaster response activities. Their relationship with the organization precedes the immediate disaster, and they are invited by that organization to become involved in a particular aspect of emergency management." (**Points of Light Foundation**, ~2003, p. 5)

Volunteers (Convergent): "A volunteer is *someone who willingly offers his/her services without expectation of financial compensation.* Volunteers that spontaneously offer their help in the wake of a disaster are known as *convergent volunteers.*" (**CA Governor's OES**, *They Will Come*, 2001, p. 3)

Volunteers (Spontaneous): "…spontaneous volunteers, are individuals who offer to help or self-deploy to assist in emergency situations without fully coordinating their activities. They are considered "unaffiliated" in that they are not part of a disaster relief organization. Although unaffiliated volunteers can be significant resources, because they do not have preestablished relationships with emergency response organizations, verifying their training or credentials and matching them with the appropriate service areas can be difficult." **DHS**, *Overview: ESF and Support Annexes…NRF*. September 2007, p. 59.)

Volunteers (Unaffiliated): "*Unaffiliated volunteers* are not part of a recognized voluntary agency and often have no formal training in emergency response. They are not officially invited to become involved but are motivated by a sudden desire to help others in times of trouble. They come with a variety of skills. They may come from within the affected area or from outside the area. (Also known as: "convergent," "emergent," "walk-in," or "spontaneous.")" (**Points of Light Foundation**, ~2003, p. 5)

VRPPs Vulnerability Reduction Purchasing Plans, DHS. (**DHS**, *Fiscal Year 2008 Buffer Zone Protection Program Guidance and Application Kit*, February 2008, pp. 10-11)

VTC: Video Teleconference. (**HSGAC**, *Hurricane Katrina:* A *Nation Still Unprepared*, 2006, 634)

Vulnerable Populations and Emergency Preparedness: "In emergency preparedness "at-risk individuals," "vulnerable populations," and "special needs populations" are terms often used interchangeably to characterize groups whose needs are not fully addressed by traditional health and social service providers. They include people with physical and intellectual disabilities, limited or non-English speakers, persons who are geographically or culturally isolated, substance abusers and addicts, people who live in poverty or rely on public assistance, people without private transportation or who rely on public transportation, the homeless, the elderly and children." (**Trust for America's Health**, *Ready or Not? 2007*, p. 79)

Vulnerable Populations Collaboration Group (CDC):

Vulnerability: "People and things are vulnerable to natural hazards, in that they are susceptible to damage and losses. In this respect, vulnerability determines the losses [to disaster] to a greater degree than does hazard." (**Alexander**, No Date, 1)

Vulnerability: "Often misunderstood, vulnerability is not synonymous with ethnicity or race, but rather it varies as a function of attributes such as age (young and old), literacy, language, functional health/disability status, isolation, culture, and social networks." (**Altevogt**, *Research Priorities in Emergency Preparedness and Response for Public Health Systems*, Jan 2008, 15)

Vulnerability: "…the characteristics of a person or group in terms of their capacity to anticipate, cope with, resist, and recover from the impact of a natural hazard. It involves a combination of factors that determine the degree to which someone's life and livelihood is put at risk by a discrete and identifiable event in nature or in society." (**Blaikie** et al., 9)

Vulnerability: The likelihood that a person will be negatively affected by environmental hazards refers to his or her *vulnerability* (**Bolin/Stanford** 1998, 9).

Vulnerability: A measure of the extent to which a potential event is likely to deplete or damage available resources such that the reestablishment of usual living conditions cannot be achieved within a reasonable period. In this sense vulnerability may be measured as a ratio of damaged to undamaged resources. (**Buckle** 1995, 11)

> "Buckle (1995, 11) adds the concept of resilience to the definition of vulnerability. He identifies potential social, economic, and environmental effects and introduces the notion that vulnerability is associated with an ability to recover (which is not always apparent in other definitions…" (**Pearce** 2000, Chapter 2, 23)

Vulnerability: "…A measure of the degree and type of exposure to risk generated by different societies in relation to hazards (**Cannon** 1994, 16)."

> Vulnerability is a characteristic of individuals and groups of people who inhabit a given natural, social and economic space, within which they are differentiated according to their varying position in society into more or less vulnerable individuals and groups. It is a complex characteristic produced by a combination of factors derived especially (but not entirely) from class, gender and ethnicity. Differences in these socio-economic factors result in hazards having a different degree of impact. (**Cannon** 1994, 19)

Vulnerability: "1. The susceptibility of a nation or military force to any action by any means through which its war potential or combat effectiveness may be reduced or its will to fight diminished. 2. The characteristics of a system that cause it to suffer a definite degradation (incapability to perform the designated mission) as a result of having been subjected to a certain level of effects in an unnatural (manmade) hostile environment. 3. In information operations, a weakness in information system security design, procedures, implementation, or internal controls that could be exploited to gain unauthorized access to information or an information system." (**D**A, *WMD-CST Operations*, December 2007, Glossary 18-19)

Vulnerability: *Vulnerability* is the susceptibility of human settlements to the harmful impacts of natural hazards. Impacts of concern include injuries and deaths to human populations; damage to personal property, housing, public facilities, equipment, and infrastructure; lost jobs, business earnings, and tax revenues, as well as indirect losses caused by interruption of business and production; and the public costs of planning, preparedness, mitigation, response, and recovery. (**Deyle** et al. 1998, 121)

Vulnerability: 1) undefended against, open to attack, disease and hazards 2) degree of potential loss of people and goods from a damaging phenomenon. Vulnerability to hazards is the cause of disasters. (**D&E Reference Center** 1998)

Vulnerability: "Definition: weakness, condition or quality of being open to exploitation, or exposed to natural or man-made threats, harm or attack. Extended definition: considered weaknesses of design, location, security posture, operation, or any combination thereof, that render an asset susceptible to disruption, destruction, or exploitation. Annotation: Vulnerability can occur in building characteristics, equipment properties, personnel behavior, locations of people/equipment/buildings, and/or operational and personnel practices. Example: Protecting America's critical infrastructure and key resources will not only make the United States more secure from terrorist attack, it will also reduce its vulnerability to natural disasters, organized crime, and computer hackers." (**DHS**, *Lexicon*, October 13, 2007, p. 27)

Vulnerability: "A weakness in the design, implementation, or operation of an asset, system, or network that can be exploited by an adversary, or disrupted by a natural hazard or technological failure." (**DHS,** *National Infrastructure Protection Plan*, 2006, p. 105)

Vulnerability: "…determinations of vulnerability are important since they include not only exposure and sensitivity, but resilience." (**DHS**, *Target Capabilities List*, 2007, p. 13)

Vulnerability: "Risk is derived from a factual event or condition and the probability of its occurrence multiplied by the consequences it produces. Vulnerability more often involves a combination of factors that make up a system. Infrastructure systems such as power supply or telecommunications or even all of the infrastructures making up a society as a whole can be analyzed for their vulnerability. Vulnerability is a measure of how well a system can cope with or sustain a risk." (**Dymon** 2005, 8)

Vulnerability: The vulnerability concept is used to characterize a system's lack of robustness or resilience with respect to various threats, both within and outside the boundaries of the system….the term vulnerability…describe[s] the properties of an industrial system that may weaken its ability to survive and perform its mission in the presence of threats….The properties of an industrial system; its premises, facilities, and production equipment, including its human resources, human organization and all its software, hardware, and net-ware, that may weaken or limit its ability to endure threats and survive accidental events that originate both within and outside the system boundaries. (**Enarson** and Rausand 1998, 535-36)

Vulnerability: "Vulnerability (or Risk) – The degree to which people, property, the environment, or social and economic activity – in short, all elements at risk – are susceptible to injury, damage, disruption, or loss." (**FEMA**, *Hazards Analysis for Emergency Mgmt.,* 1983, 5)

Vulnerability: "Any weakness that can be exploited by an aggressor or, in a non-terrorist threat environment, make an asset susceptible to hazard damage." (**FEMA** (BDHS), **2004**)

Vulnerability: "[The] susceptibility to injury or damage from hazards." (**Godschalk** 1991, 132)

Vulnerability: "The degree of loss to a given element at risk, or set of such elements resulting from the occurrence of a natural phenomenon of a given magnitude and expressed in a scale from 0 (= no damage) to 1 (= total loss) – UNDRO." (**Gunn** 1990, 374)

Vulnerability: "Vulnerability has been variously defined as the threat of exposure, the capacity to suffer harm, and the degree to which different social groups are at risk (Cutter 1996)….Perhaps equally important is the notion that vulnerability varies by location (or space) and over time – it has both temporal and spatial dimensions….There are many types of vulnerability of interest to the hazards community, but three are the most important: individual, social, and biophysical. Individual vulnerability is the susceptibility of a person or structure to potential harm from hazards….social vulnerability…describes the demographic characteristics of social groups that make them more or less susceptible to the adverse impacts of hazards. Social vulnerability suggests that people have created their own vulnerability, largely through their own decisions and actions….Biophysical vulnerability…examines the distribution of hazardous conditions arising from a variety of initiating events such as natural hazards…chemical contaminants, or industrial accidents." (**Hill and Cutter** 2001, 14-15)

Vulnerability: "Vulnerability is a set of prevailing or consequential conditions composed of physical, socioeconomic and/or political factors that adversely affect ability to respond to events. Vulnerabilities can be physical, social, or attitudinal and can be primary or secondary in nature. Strategies that lower vulnerability also reduce disaster risk." (**Jegillos** 1999, 12)

Vulnerability: "…defined as the difference between response capacity and service demand." (**Johnson** 2004, 12)

Vulnerability: "Evaluation made on the extent or frequency of exposure to an identified risk. May be classified as Highly Vulnerable, Vulnerable, or Not Vulnerable. Establishes significance of risks and the potential impact to the ongoing business functions. Important factor to be considered in establishing priorities in mitigation activities." (**Jones**, *Critical Incident Protocol*, 2000, 37)

Vulnerability: "Risk…should not be confused with vulnerability, which refers to the resources and coping abilities of a specific community to a specific hazard…Vulnerability is a reflection of the community's coping resources and may vary within the smaller social and economic groups which form a large community." (**Lindsay** 1993, 68)

Vulnerability: Vulnerability of any physical, structural or socioeconomic element to a natural hazard is its probability of being damaged, destroyed or lost. Vulnerability is not static but must be considered a dynamic process, integrating changes and developments that alter and affect the probability of loss and damage of all the exposed elements. (**Maskrey** 1989, 1)

Vulnerability: "Vulnerability is defined as the susceptibility of life, property, or the environment to damage if a hazard occurs." (**May**, p. 6)

Vulnerability: "For some, particularly natural and physical scientists, vulnerability is defined as proximity or exposure to natural hazards or the probability of a disastrous occurrence (including the potential for losses owing to triggering agents) (see Reynolds 1993).[123] Engineers, in contrast, define vulnerability as the ability of a built structure to resist the strain or force exerted by natural or other disaster agents (Norton and Chantry 1993).[124] Sociologists, anthropologists and other social scientists define vulnerability as the amount of coping capacity, or the degree to which social, cultural, political and economic factors limit the ability to take steps to mitigate, prepare for, respond to, or recover from disaster (see Blaikie and others 1994; Sinha 1992a[125]; Pelanda 1982[126])." (**McEntire** 1999, 5)

Vulnerability: "…vulnerability is the reactive or dependent component of disaster which is comprised of both the negative and positive attributes from the physical and social environments that increase risk and susceptibility and/or limit resistance and resilience to triggering events…" (**McEntire** 1999, 5)

---

[123] Referenced is a chapter in *Natural Disasters: Protecting Vulnerable Communities*, edited by P.A. Merriman and C.W. Browitts (London: Thomas Telford, 1993).
[124] Referenced is chapter by Norton and Chantry in *Natural Disasters: Protecting Vulnerable Communities*, edited by P.A. Merriman and C.W. Browitts (London: Thomas Telford, 1993).
[125] Sinha, D.K. Ed. 1992. Natural Disaster Reduction to the Nineties: Perspectives, Aspects and Strategies. Calcutta: International Journal Servicies.
[126] Pelanda, Carlo. 1982. "Disastro e vulnerabilita sociosistemica." *Rassegna Italian di Sociologia* 22:507-532.

Vulnerability: "…the potential for loss or the capacity to suffer harm from a hazard…can generally be applied to individuals, society, or the environment" (**Mitchell** 1997, 10).

Vulnerability: "The susceptibility of people, property, industry, resources, ecosystems, or historical buildings and artifacts to the negative impact of a disaster." (**Pearce** 2000, Chapter 5, p. 37). Is "a function of people, place, preparedness, and time…" (Ibid., p. 44)

Vulnerability: "Vulnerability can be defined as the propensity to incur loss." (**Puente** 1999, 296)

Vulnerability: The degree of susceptibility and resilience of the community and environment to hazards, the characteristics of a community or system in terms of its capacity to anticipate, cope with, and recover from events. (**Salter** 1997–98, 28)

Vulnerability: The extent to which a community, structure, service, or geographic area is likely to be damaged or disrupted by the impact of a particular disaster hazard, on account of their nature, construction, and proximity to hazardous terrain or a disaster-prone area. For engineering purposes, vulnerability is a mathematical function defined as the degree of loss to a given element at risk, or set of such elements, expected to result from the impact of a disaster hazard of a given magnitude. It is specific to a particular type of structure, and expressed on a scale of 0 (no damage) to 1 (total damage). For more general socio-economic purposes and macro-level analyses, vulnerability is a less-strictly-defined concept. It incorporates considerations of both the intrinsic value of the elements concerned and their functional value in contributing to communal well-being in general and to emergency response and post-disaster recovery in particular. In many cases, it is necessary (and sufficient) to settle for a qualitative classification in terms of "high", "medium", and "low"; or explicit statements concerning the disruption likely to be suffered. (**Simeon Institute**)

Vulnerability: "Degree of loss (from 0% to 100%) resulting from a potentially damaging phenomenon." (**UNDHA,** *DM Glossary*, 1992, 77)

Vulnerability: Ability to withstand damage – expressed on a scale of 0 (no damage) to 10 (total damage). (**UNDRO** 1991)

Vulnerability: "Vulnerability represents the interface between exposure to the physical threats to human well-being and the capacity of people and communities to cope with those threats. Threats may arise from a combination of social and physical processes." (**UNEP**, *GEO-3: Global Environment Outlook*, Chapter 3, Human Vulnerability to Environmental Change, p. 302)

Vulnerability: "Vulnerability to disasters is a status resulting from human action. It describes the degree to which a society is either threatened by or protected from the impact of natural hazards. This depends on the condition of human settlements and their infrastructure, the way in which public policy and administration are engaged in disaster management, the level of information and education about hazards and how to deal with them." (**UN ISDR** 2001)

Vulnerability: "A set of conditions and processes resulting from physical, social, economical and environmental factors, which increase the susceptibility of a community to the impact of hazards." (**UN ISDR** 2002, 24)

Vulnerability: "Vulnerability is…the most elusive component of the hazard-vulnerability-coping capacity-risk (losses)-recovery cycle. It needs to be defined as *"vulnerability of what", "vulnerability to what"* at *"what scale"* to mention but the most important aspects." (**Villagran**. (UNU-EHS), *Vulnerability: A Conceptual and Methodological Review*, 2006, p. 5)

Vulnerability (Homeland Security): "Homeland security involves a systematic, comprehensive, and strategic effort to reduce America's vulnerability to terrorist attack. We must recognize that as a vibrant and prosperous free society, we present an ever-evolving, ever-changing target. As we shore up our defenses in one area, the terrorists may exploit vulnerabilities in others. The *National Strategy for Homeland Security*, therefore, outlines a way for the government to work with the private sector to identify and protect our critical infrastructure and key assets, detect terrorist threats, and augment our defenses." (**White House**, *National Strategy for HS*, 2002, 2)

Vulnerability (Infrastructure): "The characteristics of an installation, system, asset, application, or its dependencies that could cause it to suffer a degradation or loss (incapacity to perform its designated function) as a result of having been subjected to a certain level of threat or hazard." (**DoD**, *Defense Critical Infrastructure Program (DCIP)*, August, 2005, p. 14)

Vulnerability and Consequences (DHS Model Used in Determining Relative Terrorism Risk Scores): "Vulnerability and Consequences accounted for 80 percent of the total risk score and were represented by the following four indices:

- Population Index (40 percent): This variable included nighttime population and military dependant populations for states and urban areas, based upon U.S. Census Bureau and Department of Defense inputs. In addition, for urban areas, population density, commuters, and visitors were also factored into this variable, using data from private entities.

- Economic Index (20 percent): This variable considered the economic value of the goods and services produced in either a state or an urban area. For states, this index was calculated using U.S. Department of Commerce data on their percentage contribution to Gross Domestic Product. For UASI urban areas, a parallel calculation of Gross Metropolitan Product was incorporated.

- National Infrastructure Index (15 percent): This variable focused on over 2,000 Tier I and Tier II critical infrastructure/key resource assets that were identified by DHS's Office of Infrastructure Protection. Tier I assets or systems are those that if attacked could trigger major national or regional impacts similar to those experienced during Hurricane Katrina or 9/11. Tier II assets are other highly consequential assets with potential national or regional impacts if attacked.

- National Security Index (5 percent): This variable considered the presence of three key national security factors: whether military bases are present in the state or urban area; how many critical defense industrial base facilities are located in the state or urban area; and the total number of people traversing international borders. Information on these inputs comes from the Department of Defense and DHS." (**GAO**, *Homeland Security*: *DHS Improved its Risk-Based Grant Programs' Allocation and Management Methods, But Measuring Programs' Impact on National Capabilities Remains a Challenge*, 11 March 2008, p. 10)

Vulnerability Analysis: Identifies what is susceptible to damage. Should provide information on extent of the vulnerable zone; population, in terms of size and types that could be expected to be within the vulnerable zone; private and public property that may be damaged, including essential support systems and transportation corridors; and environment that may be affected.

Vulnerability Analysis: "The objectives of a vulnerability analysis of an industrial system may comprise:

- To identify potential threats to the system
- To verify that the vulnerability of the system is acceptable
- To verify that the system's security actions and installations, and safety functions are adequate
- To evaluate the cost-effectiveness of a proposed action to improve the vulnerability
- To aid in establishing an emergency preparedness plan
- As a design tool—to design a robust system

"In a vulnerability analysis we work with open system models, where risk factors both inside and outside the physical boundaries of the system are taken into account. A vulnerability analysis and a risk analysis of the same company will therefore produce quite different sets of accidental events….

"A traditional risk analysis is mainly limited to accidental events taking place within the physical boundaries of the system, and the threats studied are often limited to technological hazards within these boundaries….The actions to mitigate, restore and restart the activities after an accident are normally not part of a risk analysis….A vulnerability analysis focuses on the whole disruption period until a new stable situation is obtained….The focal point of a vulnerability analysis is the (business) survivability of the system." (**Einarsson and Raussand** 1998)

Vulnerability Analysis: The process of estimating the vulnerability to potential disaster hazards of specified elements at risk. For engineering purposes, vulnerability analysis involves the analysis of theoretical and empirical data concerning the effects of particular phenomena on particular types of structures. For more general socio-economic purposes, it involves consideration of all significant elements in society, including physical, social and economic considerations (both short and long-term), and the extent to which essential services (and traditional and local coping mechanisms) are able to continue functioning. (**Simeon Institute** 1998)

Vulnerability Analysis: "Vulnerability Analysis is a systematic investigation of the characteristics of a person or group and their situation that influence their capacity to anticipate,

cope with, resist and recover from the impact of natural hazard." (**ProVention Consortium**, *CRA Toolkit: Glossary of Terms*, 2006)

Vulnerabilities Analysis Matrix: "A practical and diagnostic tool in the form of a simple matrix which measures vulnerabilities and capacities in three broad and interrelated areas (i.e., physical/material, social/organizational, and motivational/attitudinal) Other factors are added to the matrix to reflect a complex reality such as disaggregation by gender or economic factors, changes over time, different scales etc.). The benefits of the matrix are that it is practical and broad-based, linking the many different aspects of vulnerabilities and capacities. Limitations to the approach include that on its own the matrix does not provide indicators of vulnerabilities and capacities but only an overarching framework, and that applied alone, it tends to underestimate the significance of natural hazards by concentrating on human aspects of disaster." (**UNDAP**, *Techniques Used in Disaster Risk Assessment*, 2008)

Vulnerability Assessment: Evaluation of the likely degree of loss to a risk or a set of hazards. (**D&E Reference Center** 1998)

Vulnerability Assessment: …characterizes the exposed populations and property and the extent of injury and damage that may result from a natural hazard event of a given intensity in a given area. (**Deyle**, French, Olshansky and Paterson 1998, 121).

Vulnerability Assessment: Vulnerability assessment, the second level of hazard assessment, combines the information from the hazard identification with an inventory of the existing (or planned) property and population exposed to a hazard. It provides information on who and what are vulnerable to a natural hazard within the geographic areas defined by hazard identification; vulnerability assessment can also estimate damage and casualties that will result from various intensities of the hazard." (**Deyle** et al. 1998, 129)

Vulnerability Assessment: "Definition: Determine the exposure, weaknesses, and/or susceptibility to attack of assets and systems. A vulnerability assessment is a systematic process to measure the susceptibility of a sector, segment, region, or individual site to attack. Through a vulnerability assessment, areas of weakness and potential actions that would exploit those weaknesses are identified, and the effectiveness of additional security measures is assessed." (**DHS**, *Universal Task List Version 2.1*, 2005, p. 42)

Vulnerability Assessment: A vulnerability assessment presents "the extent of injury and damage that may result from a hazard event of a given intensity in a given area. The vulnerability assessment should address impacts of hazard events on the existing and future built environment." (**FEMA** 2001 (August), 7)

Vulnerability Assessment: Vulnerability assessment estimates the number of people exposed to hazards (including special populations such as the elderly, hospitalized, disabled, and concentrated populations such as children in schools), the property exposed, and the critical facilities exposed (such as medical care facilities, bridges, sewage treatment and water pumping and treatment plants, power plants, and police and fire stations. (**Godschalk**, Kaiser, and Berke 1998, 98-99.)

Vulnerability Assessment: "Vulnerability assessments include risk/hazard information, but also detail the potential population at risk, the number of structures that might be impacted, or the lifelines, such as bridges or power lines (Platt 1995), that might be damaged. Vulnerability assessments describe the potential exposure of people and the built environment. The concept of vulnerability incorporates the notion of differential susceptibility and differential impacts." (**Hill and Cutter**, 2001, 16)

Vulnerability Assessment: "Some emergency managers include geophysical and topographical factors in the vulnerability assessment process, while others include them in the risk assessment process. For example, Picket and Block (1991, 278-79), following the work of Terrence Haney, discuss the development of an earthquake hazard vulnerability model that utilizes data from five key areas: (1) geophysical, (2) topographical, (3) transportation and utility infrastructure, (4) structural facilities (buildings and bridges), and (5) demographic factors. Pearce et al. (1993, 4) argue that the consideration of geophysical and topographical factors belongs in the risk assessment process. For example, an analysis that concludes that the existence of a fault-line increases the likelihood of an earthquake occurring is part of risk assessment; however, the proximity of the community to the fault-line may increase or decrease the vulnerability of the population. Related to this argument is Anderson's (1992) suggestion that emergency planners should give special consideration to the growing vulnerability of metropolitan areas. Anderson makes an important point, as often the consequences of disasters in metropolitan areas are related to how geographic and topographic information has been considered. If, for example, such information is perceived to be part of risk assessment, then proximity to a fault-line would lead to mitigation measures that could address the need to reduce risk by zoning against construction near the line, expropriating existing properties, and so on. If, on the other hand, such information is perceived to be part of vulnerability assessment, then the issue becomes not one of reducing the likelihood of experiencing an earthquake but of how to decrease one's vulnerability by residing in an earthquake-resistant building, improving the infrastructure, or whatever." (**Pearce** 2000, Chapter 2, 24-25)

Vulnerability Mapping: "Vulnerability mapping involves mapping geographical areas, resources and people or households in vulnerable areas likely to be impacted/affected by hazards." (ProVention Consortium, CRA Toolkit: Glossary of Terms, 2006)

Vulnerability Reduction Purchasing Plan: "A VRPP — or Vulnerability Reduction Purchasing Plan — is an itemized list of the specific equipment that the responsible jurisdiction proposes to procure to mitigate the vulnerabilities identified in the BZPP for a given site. The VRPP must include the appropriate AEL number of the equipment to be procured, the proposed vendor, quantity, unit price, and shipping and handling/delivery costs. All items found in the VRPP must be identified in Section 8.4 of the BZPP; however, Section 8.4 may include additional recommended equipment purchases that will not be funded by DHS under the BZPP Program. Both the state and the responsible jurisdiction must sign off on the VRPP before it is sent to DHS, which has final approval over all equipment purchases." (**DHS**, *BZPP Update*…, March, 1, 2005 Draft, p. 7)

Vulnerability Trends: "Our global environment is changing rapidly, and many of those changes increase our exposure and render us more vulnerable to risks and hazards. These trends also place

greater demands on Federal, State and local authorities to be prepared and capable of managing emergencies resulting from hazards of all kinds.

- Our population is growing…
- We depend more every day on complex and interdependent systems…
- The pace of events around us is accelerating…
- There is a growing public reliance on government for crisis support…
- There is a growing need to effectively and efficiently use public resources…
- Global political conditions remain unstable – while the risks of global war have diminished, the number of regional and local political disputes has grown. Proliferation of conventional, nuclear, chemical, and biological weapons technologies and sophisticated delivery systems increase the potential for attack from a variety of sources. These risks make it prudent for us to maintain our preparedness to meet attack emergencies of all kinds. These factors make up the complex environment of any emergency that a jurisdiction may experience. They put a high premium on all-hazard preparedness and the ability to deal with the consequences of emergencies regardless of their cause. They also raise the prospect of severe consequences for failure to be ready when the next emergency occurs. They place new emphasis on the ability of government response capabilities to survive and perform in any emergency. They are key reasons for the high priority FEMA places on achieving nationwide Survivable Crisis Management." (**FEMA**, *An Introduction to Survivable Crisis Management*, 1992, 10)

Vulnerability Assessment (Infrastructure): "A systematic examination of the characteristics of an installation, system, asset, application, or its dependencies to identify vulnerabilities." (DoD, Defense Critical Infrastructure Program, August 2005, p. 14)

Wait-And-See Principle: "A reactive method of dealing with the environment that places the burden of proof on those who would conserve. (Opposite: the precautionary principle)." (**European Environment** Agency, EEA *Environmental Glossary*; cites: European Community Biodiversity Clearing-House Mechanism. Glossary of terms related to the CBD)

War on Terrorism: "The War on Terrorism is a national response to high-profile violence conducted by small but potent movements of violent extremists seeking to destabilize and disempower national governments. Their targets are nations whose policies and presence in Islamic countries prevents the realization of their vision of a global 'virtual Caliphate' of Islamic governments in predominantly Muslim countries around the world. Other non-state organizations using terrorism or organized political violence for local or global ends that are inimical to U.S. national interests adds to the challenge." (Department of State. *Counterinsurgency in the 21st Century--Creating a National Framework*, Bureau of Political-Military Affairs, Sep 11, 2006)

Warden Service: "Now to show you how we control our people, I have prepared some charts to show you the control we have set up over people. It is known as the 'warden service'. It is a very simple service and it is a service where the operators stay at home. …The basis of our warden service is on the multiples of 10 – 10 beats to a post, 10 posts to a district, and as many districts as you need in a zone. The chief warden is at the control center with a sone warden at each of the zone control centers, a warden headquarters for each district, and a small headquarters for each post…. The warden should be someone who lives on that beat and who is highly respected, whose people have confidence in him. There are many things he should de

prebomb. He should make a map of his beat. He should know exactly where the houses are. He should know where the fire hydrants are. He should know if trees are apt to blow over and block a street. He should know if there are any people seriously ill so if he has to evacuatge the area they can be moved. He shoule know where the shelter is for each one of theese houses because if it is an area of heavy desteruction, that information is most important…. He must know aht the condtions are in each area as to first aid; how many people in the area have had first aid training and know what to do…." (**Huebner**, *Civil Defense*, 1953, p. 28)

Warm Site: "An alternate facility that is equipped with some hardware, and communications interfaces, electrical and environmental conditioning which is capable of providing backup after additional provisioning, software or customization is performed." (**DHS**, *FCD 1*, 2007, P-10)

Warm Zone (HazMat): "Area between Hot and Cold zones where personnel and equipment decontamination and hot zone support take place. It includes control points for the access corridor and thus assists in reducing the spread of contamination. Also referred to as the contamination reduction corridor (CRC), contamination reduction zone (CRZ), yellow zone or limited access zone in other documents. (EPA Standard Operating Safety Guidelines, OSHA 29 CFR 1910.120, NFPA 472)." (**DOT**, *Emergency Response Guidebook*, 2004, p. 365)

Warming: "The term 'warning' refers to any text, voice, video, or other information provided by an authorized official to provide direction to the public and/or private sector about an ongoing emergency situation that requires immediate actions to protect life, health, and property. A warning requires immediate actions to protect life, health, and property and is typically issued when there is a confirmed threat posing an immediate danger to the public." (**DHS**, *TCL*, 2007, p. 421)

WARN: Web Alert Relay Network (**FEMA**, *IPAWS System Enhancements*, Sep 12, 2007)

Warning: A warning is issued by the National Weather Service to let people know; that a severe weather event is already occurring or is imminent. People should take immediate safety action. (**Simeon Institute** 1992)

Warning: Dissemination of message signaling imminent hazard which may include advice on protective measures. See also "alert". (**UN**, *Internationally Agreed Glossary of Basic Terms Related to Disaster Management*, 1992, p. 77)

Warning Time Assessment, 1953: "It is assumed that civil defense officials will receive some warning of an impending air attack. Although complete surprise is possible, it is assumed that approximately 15 minutes warning can now be given to the public….Surprise is most likely to be achieved in an attack by guided missiles launched from submarines" (**FCDA,** *1953 Annual Report*, 11)

Warnings: "A warning prompts people to take immediate actions that save lives, reduce injuries and protect property. Natural and manmade hazards create disasters when they kill and injure people, destroy and damage property, and cause further economic and emotional problems by instilling a sense of unease and uncertainty into society. Such losses can and have been reduced

when people receive an alert of what is likely to happen soon, or notification of what is happening and advice about what to do in response to the hazard. With such knowledge, people can take appropriate action to get out of harms way, to reduce losses, to reduce uncertainty, and to speed recovery. Thus a warning must provide the information and motivation for people to take informed action." (**PPW**, *Protecting America's Communities,* 2004, p. 3)

WARNOs: Warning Orders. (**Dept. of the Army**, *WMD-CST Operations*, Dec. 2007, p. 4-7)

Washington (DC) Area Warning System (WAWAS):

- Owned/operated by FEMA; delegated operations to DC government
- Connects 119+ Federal, State & local agencies in the National Capital Region. (**FEMA**, *IPAWS Update*, 2007, slide 19)

Washington Metropolitan Area Warning System (WAWAS): "The Washington Area Warning System (WAWAS), is a portion of the NAWAS, but is not tied directly to the NAWAS. It is operated and maintained by the FEMA Operations Center. While the NAWAS is Nationwide, the WAWAS is dedicated to the Washington, DC, metropolitan area. On a day-to-day basis, the DC Office of Emergency Management manages the WAWAS due to the amount of local information disseminated across the system. OPM uses the WAWAS to pass duty information to the various Federal departments and agencies located in the Washington, DC, area in the event of bad weather or other business affecting government operations." (**HSC**, *NCPIP*, 67)

Watch: A watch is issued by the National Weather Service to let people know that conditions are right for a potential disaster to occur. It does not mean that an event will necessarily occur. People should listen to their radio or TV to keep informed about changing weather conditions. A watch is issued for specific geographic areas, such as counties, for phenomena such as hurricanes, tornadoes, floods, flash floods, severe thunderstorms, and winter storms. (**Simeon Institute** 1992)

Water Resources Development Act of 2007: Public Law 110-114**.** Authorizes the National Levee Safety Program. (**Hecker and Bronowicz**, *The National Levee Safety Program*, *12*Dec07)

Water Sector, National Infrastructure Protection Program: "There are approximately 160,000 public drinking water utilities and more than 16,000 wastewater utilities in the United States. About 84 percent of the U.S. population receives its potable water from these drinking water utilities and more than 75 percent has its sanitary sewage treated by these wastewater utilities. The drinking water and wastewater sector (Water Sector) is vulnerable to a variety of attacks, including contamination with deadly agents and physical and cyber attacks. If these attacks were to occur, the result could be large numbers of illnesses or casualties or denial of service that would also affect public health and economic vitality. Critical services such as firefighting and health care (hospitals), and other dependent and interdependent sectors such as energy, transportation, and food and agriculture, would suffer negative impacts from a denial of Water Sector service." (**DHS &** EPA, *Water Critical Infrastructure and Key Resources Sector Specific Plan as input to the National Infrastructure Protection Plan*, May 2007)

Watershed: "Watershed means an area of any size that drains into a lake, stream, or other body of water; also known as "basin" or "catchment area." (FEMA, *Reducing Damage from Localized Flooding – A Guide for Communities*, 2005, viii)

Watershed: "All land within the confines of a drainage divide. This is also called a "catchment" or "drainage basin". All surface water has a common outlet." (**UNDHA**, *DM Glossary*, 1992, 78)

Watershed Management: "The implementation of a plan or plans for managing the quality and flow of water within a watershed, the naturally defined area within which water flows into a particular lake or river or its tributary. The aims of watershed management are holistic and concern the maintenance of water quality, the minimization of storm water runoff, the preservation of natural flood controls such as wetlands and pervious surface, and the preservation of natural drainage patterns. Watershed management is, in many ways, an enlargement of most of the concerns that underlie floodplain management." (**APA**, 2005, p. 85)

WAWAS: Washington Area Warning System. (**FEMA**, *IPAWS Update*, 2007, slide 19)

Weapon Of Mass Destruction (WMD): "As defined in Title 18, U.S.C. § 2332a: (1) any explosive, incendiary, or poison gas, bomb, grenade, rocket having a propellant charge of more than 4 ounces, or missile having an explosive or incendiary charge of more than one-quarter ounce, or mine or similar device; (2) any weapon that is designed or intended to cause death or serious bodily injury through the release, dissemination, or impact of toxic or poisonous chemicals or their precursors; (3) any weapon involving a disease organism; or (4) any weapon that is designed to release radiation or radioactivity at a level dangerous to human life." (**USCG**, *IM Handbook*, 2006, Glossary 25-26)

Weapons of Mass Destruction (WMDs): "Weapons that are capable of killing a lot of people and/or causing a high-order magnitude of destruction, or weapons that are capable of being used in such a way as to cause mass casualties or create large-scale destruction. WMDs are generally considered to be nuclear, biological, chemical, and radiological devices, but WMDs can also be high-explosive devices." (**DHS**, *FCD 1*, Nov. 2007, P-10)

Weapons of Mass Destruction (WMD): "(1) Any explosive, incendiary, or poison gas (i) bomb, (ii) grenade, (iii) rocket having a propellant charge of more than 4 ounces, (iv) missile having an explosive or incendiary charge of more than one-quarter ounce, or (v) mine or (vi) similar device; (2) any weapon that is designed or intended to cause death or serious bodily injury through the release, dissemination, or impact of toxic or poisonous chemicals or their precursors; (3) any weapon involving a disease organism; or (4) any weapon that is designed to release radiation or radioactivity at a level dangerous to human life (18 U.S.C. 2332a)." (**DHS,** *NIPP*, 2006, p. 105)

Weapons of Mass Destruction (WMD): "The atomic bomb and chemical warfare are weapons of mass destruction most efficiently used on large targets, such as our standard metropolitan areas, with their high concentrations of population and industry. Biological warfare can be efficiently used against both urban and rural areas and populations." (**FCDA**, *1953 Annual Report*, 10)

Weapons of Mass Destruction (WMD): "Any weapon or device that is intended, or has the capability, to cause death or serious bodily injury to a significant number of people through the release, dissemination, or impact of toxic or poisonous chemicals or their precursors, a disease organism, or radiation or radioactivity." (**FEMA**, *Devolution of Operations Plan Template*)

Weapons of Mass Destruction: "Any destructive device that is intended or capable of causing death or serious injury to a large number of people through the release, dissemination, or impact of toxic or poisonous chemicals or their precursors, disease-causing organisms, radiation or radioactivity or conventional explosives sufficient for widespread lethality. (**Jones**, *Critical Incident Protocol*, 2000, 37)

Weapons of Mass Destruction vs. Agents of Mass Injury: "Chemical, biological, and radiological agents should not be regarded as weapons of mass destruction, but potential agents of mass injury. In this respect, they differ completely from nuclear weapons. The link between injury caused by CBR agents and loss of life can be broken or mitigated by the provision of equipment, organization and training for emergency responders." (World Association for Disaster and Emergency Medicine. "The Provision of Care for Victims of Chemical, Biological, Radiological, and Nuclear Releases…," Jan-Feb 2008, pp. 95-96)

Weapons of Mass Destruction Civil Support Team (WMD-CST): "The WMD-CSTs are NG units designed to provide a specialized capability to respond to a CBRNE incident primarily in a *Title 32 USC* operational status within the United States and its territories as established by *Title 10 USC*. Responding under the authority of the governor, they provide significant capabilities to assist local and state agencies that may be overwhelmed by an intentional or unintentional release of CBRNE or natural or man-made disasters. The WMD-CSTs also have the capability to provide support for smaller-scale incidents where specific technical capabilities are required. The WMD-CST may also be federalized and deployed as a part of a federal response to an incident in or outside the WMD-CST assigned state." (**DA**, *WMD CST Operations*, 2007, p. 1-3)

Weapons of Mass Destruction Civil Support Team (WMD-CST): "Joint National Guard (Army National Guard and Air National Guard) team established to deploy rapidly to assist a local incident commander in determining the nature and extent of a weapons of mass destruction attack or incident; provide expert technical advice on weapons of mass destruction response operations; and help identify and support the arrival of follow-on state and federal military response assets. Also called WMDCST." (**JCS/DoD**, *Civil Support* (JP 3-28), 2007, p. GL-12)

Weapons of Mass Destruction Civil Support Teams: "In a commencement address at the U.S. Naval Academy in May 1998, President Bill Clinton announced that the nation would do more to protect its citizens against the growing threat of chemical and biological terrorism. As part of this effort, he said, the Department of Defense would form 10 teams to support state and local authorities in the event of an incident involving weapons of mass destruction.

"The WMD Civil Support Teams were established to deploy rapidly to assist a local incident commander in determining the nature and extent of an attack or incident; provide expert technical advice on WMD response operations; and help identify and support the arrival of follow-on state and federal military response assets. They are joint units and, as such, can

consists of both Army National Guard and Air National Guard personnel, with some of these units commanded by Air National Guard lieutenant colonels.

“The mission of Weapons of Mass Destruction Civil Support Teams (WMD-CST) is to support local and state authorities at domestic WMD/NBC incident sites by identifying agents and substances, assessing current and projected consequences, advising on response measures, and assisting with requests for additional military support.

“The WMD civil support teams are able to deploy rapidly, assist local first-responders in determining the nature of an attack, provide medical and technical advice, and pave the way for the identification and arrival of follow-on state and federal military response assets. They provide initial advice on what the agent may be, assist first responders in that detection assessment process, and are the first military responders on the ground, so that if additional federal resources are called into the situation, they can serve as an advance party that can liaise with the Joint Task Force Civil Support.

“The units provide critical protection to the force, from the pre-deployment phase of an operation at Home Station through redeployment. They ensure that strategic national interests are protected against any enemy; foreign or domestic, attempting to employ chemical, biological, or radiological weapons - regardless the level of WMD/NBC threat. They are a key element of the Department of Defense's overall program to provide support to civil authorities in the event of an incident involving weapons of mass destruction in the United States. They maintain the capability to mitigate the consequences of any WMD/NBC event, whether natural or man-made. They are experts in WMD effects and NBC defense operations. These National Guard teams provide DoD's unique expertise and capabilities to assist state governors in preparing for and responding to chemical, biological, radiological or nuclear (CBRN) incidents as part of a state's emergency response structure. Each team consists of 22 highly skilled, full-time National Guard members who are federally resourced, trained and exercised, and employs federally approved CBRN response doctrine.

“These units derive their origins in guidance from the US Congress which stated the need to "establish and equip small organizations in each of the 44 states not receiving initial RAID (Rapid Assessment and Initial Detection) element in 1999 to provide limited chemical/biological response capability".

“With RAID teams renamed WMD-CST, the first 10 teams were based in Colorado, Georgia, Illinois, California, Massachusetts, Missouri, New York, Pennsylvania, Texas and Washington; with each team being originally fielded in each of the 10 Federal Emergency Management Agency regions. An additional 17 teams, were announced in January 2000….

“The WMD Civil Support Teams are unique because of their federal-state relationship. They are federally resourced, federally trained and federally evaluated, and they operate under federal doctrine. But they will perform their mission primarily under the command and control of the governors of the states in which they are located. They will be, first and foremost, state assets. Operationally, they fall under the command and control of the adjutant generals of those states.

As a result, they will be available to respond to an incident as part of a state response, well before federal response assets would be called upon to provide assistance.

"If the situation were to evolve into an event that overwhelmed state and local response assets, the governor could request the president to issue a declaration of national disaster and to provide federal assistance. At that point, the team would continue to support local officials in their state status, but would also assist in channeling additional military and other federal assets in support of the local commander....

"WMD-CST units must undergo 15 months of individual and unit training. Following this, and as mandated by Congress, each WMD-CST units is evaluated for operational certification by the Secretary of Defense. Each team has two large pieces of equipment, a mobile analytical laboratory that it deploys with, that is utilized for field analysis of chemical or biological agents, and they also have a uniform command suite that has the ability through multiplexing systems to provide interoperability of communications to the various and sundry responders who may be on scene.

"On November 15, 2001, Secretary of Defense Donald H. Rumsfeld announced the stationing plan for five additional National Guard Weapons of Mass Destruction Civil Support Teams (WMD-CST) authorized in the National Defense Authorization Act for fiscal 2001…bringing the total number of National Guard WMD-CSTs to 32….

"On March 9, 2004, the Department of Defense announced that it had notified Congress of the fielding plan for 12 additional...WMD-CSTs. Congress had directed the establishment of 23 additional teams in the National Defense Authorization Act for FY03 and funded the establishment of the first 12 in the Defense Appropriations Act for FY04….

"On November 22, 2004, the Department of Defense announced that it had notified Congress of the fielding plan for 11 new…WMD-CSTs. The fielding and certification of these final 11 teams will bring the total number of WMD-CSTs to 55…." (**Global Security.org**, *Weapons of Mass Destruction Civil Support Teams*, 2007; See, also, **DA**, *WMD-CST Operations*, Dec. 2007)

Weapons of Mass Destruction Civil Support Teams, National Response Categories: "The three response categories and their deployment standards are as follows:

- **Priority (gold).** Priority response (gold) requires the deployment of an advanced party of the WMD-CST no later than 90 minutes after the official time of notification (N) and deployment of the remaining WMD-CST no later than N + 3 hours to support a response anywhere within the Nation.
- **Ready (silver).** Ready response (silver) requires units to focus on preparing for possible priority response missions outside their home state. WMD-CSTs in this phase, once directed, must deploy to the event no later than N + 24 hours.
- **Standby (bronze).** Standby response (bronze) requires units to focus on areas such as training requirements and leave. WMD-CSTs in this category, once directed, must prepare for and deploy no later than N + 72 hours.

WMD-CSTs that are not mission-capable (black) are unavailable for deployment." (**DA**, *WMD-CST Operations*, December 2007, p. 2-1)

Weapons of Mass Destruction Medical Countermeasures (WMD MCM) Subcommittee: "This Subcommittee is the focal point for U.S. Government interagency efforts to prioritize and coordinate medical countermeasure acquisition programs. The WMD MCM Subcommittee considers a wide range of variables in their deliberations. These include the credibility and immediacy of the threat as determined by DHS material threat assessments (MTAs) and models of potential target populations and the settings in which the medical countermeasure would be used. It also evaluates the availability and suitability of current medical countermeasures and the products in the research and development pipeline. It considers utilization policies for potential medical countermeasures including the dosing schedule, the feasibility of deployment in a public health emergency and product shelf life and storage requirements. These factors, with others, form the basis of the U.S. Government's requirements. The Subcommittee is made up of Assistant Secretary-level officials from HHS, DoD, and DHS. Four Working Groups and a Steering Group serve the Subcommittee; these are the Chemical, Biological, Radiological/Nuclear, and Product Development Tools Working Groups and the Steering and Integration Group (STIG)." (**HHS**, *Pandemic and All-Hazards Preparedness Act Progress Report*, November 2007, Appendix 2, WMD MCM Subcommittee)

Weapons of Mass Effect (WME): "Weapons of mass effect, or WME, are weapons capable of inflicting grave destructive, psychological and/or economic damage to the United States. These include chemical, biological, nuclear, radiological, or explosive weapons." (**HSAC,** *Weapons of Mass Effect Task Force on Preventing the Entry of Weapons of Mass Effect Into the United States*, January 10, 2006, p. 3)

[**Note**: Due to concerns over confusion spawned by attempts to draw distinctions between the terms "weapons of mass destruction" and "weapons of mass effect," as well as "CBRN" or "CBRNE" (chemical, biological, radiological, nuclear, high-explosive) the Department of Homeland Security ceased referring to "weapons of mass effect" in 2006.[127]]

Web Alert Relay Network (WARN): "The WARN pilot project provides emergency operations staffs with web-based collaboration tools and alert and warning capabilities. The WARN pilot project is also working to develop a two-way messaging framework based on international standards that supports emergency messages generated and sent by authorized emergency officials at the Federal, State, region, county, parish, or tribal level. In addition, the WARN pilot provides opt-in capabilities for the public in pilot locations to receive alert and warning messages on their computers, cell phones, pagers, and other devices." (**FEMA**, *IPAWS System Enhancements*, Sep 12, 2007)

WebEOC: "**…**a common piece of software for situational awareness and resource tracking used in the emergency management community…" (**Libby**, *Statement of,* July 19, 2007, p. 4)

WebEOC: "WebEOC is a web-based information management system that provides a single access point for the collection and dissemination of emergency or event-related information. It

[127] Email communication from DHS Lexicographer, December 11, 2007.

was designed to aid decision making by providing authorized users real-time information in a user-friendly format. WebEOC can be used during the planning, mitigation, response and recovery phases of any emergency. It can also be used by agencies during day-to-day activities to manage routine, non-emergency related operations. Web EOC integrates data, video, messaging, and many other types of information. It distributes that information both to individual terminals and to projection screens. It also allows for remote access via the Internet for authorized users. Being able to share real time information with other agencies in the region can allow for more rapid deployment of the regional resources available to emergency managers." (**Mid-America Regional Council**, *Emergency Services & Homeland Security*, 2007)

Western Training School (Civil Defense), St. Mary's CA: Opened by FCDA October 8, 1951 to serve 11 States. (**FCDA**, *Annual Report 1951*, 1952, p. 23)

Wetlands: "A wetland is a sponge which soaks up extra water and then releases it slowly into a watershed or river system. When you remove it you remove this safety valve." (Richard Boon, Wildlife and Environment Society of South Africa, quoted in **WWF**, *Natural Security*, 2008, 55)

Wetlands: Those areas which are inundated or saturated by surface or ground water with a frequency sufficient to support, or that under normal hydrologic conditions does or would support, a prevalence of vegetation or aquatic life typically adapted for life in saturated or seasonally saturated soil conditions. Examples of wetlands include, but are not limited to, swamps, fresh and salt water marshes, estuaries, bogs, beaches, wet meadows, sloughs, potholes, mud flats, river overflows, and other similar areas. This definition includes those wetland areas separated from their natural supply of water as a result of activities such as the construction of structural flood protection methods or solid-fill road beds and activities such as mineral extraction and navigation improvement. This definition is intended to be consistent with the definition utilized by the U.S. Fish and Wildlife Service in the publication entitled, Classification of Wetlands and Deep Water Habitats of the United States (**Cowardin** et al., 1977). (**FEMA** 1992)

WME: Weapons of Mass Effect.

WMO: World Meteorological Organization

Workshop: "A workshop resembles a seminar, but is employed to build specific products, such as a draft plan or policy (e.g., a Training and Exercise Plan Workshop is used to develop a Multi-year Training and Exercise Plan)." (**FEMA**, *About HSEEP*, 2008)

Workshop: "The workshop, a type of *discussion-based* exercise, represents the second tier of exercises in the *building-block approach*. Although similar to *seminars*, workshops differ in two important aspects: increased *participant* interaction, and a focus on achieving or building a product (e.g., plans, policies). A workshop is typically used to: test new ideas, processes, or procedures; train groups in coordinated activities; and obtain consensus. Workshops often use breakout sessions to explore parts of an issue with smaller groups." (**FEMA**, *Homeland Security Exercise and Evaluation Program Glossary*, 2008)

Worst Case Planning: "Worst-case planning is required. Planning must mesh "worst-case" considerations with an analysis of the risks involved. Emergency planners generally use "worst-case" planning for those coastal areas that are most likely to be seriously impacted by hurricane force winds and storm surge. During Hurricane Hugo, the planning horizons for the *inland* areas were found to be too limited… Energy emergency planners must continue to include risk analysis and the likelihood of "worst-case" scenarios in the planning process to ensure a balanced view of their preparedness efforts and the potential risks involved." (**Badolato**, *Hurricane Hugo: Lessons Learned in Energy Emergency Preparedness*, 1999, pp. 1-2)

Worst Case Scenario Planning: "A major reason why most current plans (which continue to evolve) are useless is that they assume the worst case scenario. Worst case scenario planning encourages counterproductive overreactions in which law-enforcement techniques and drastic anti-civil liberties measures are used as the first resort, rather than the last resort. Although it is widely recognized that there were three flu pandemics in the past century (1918, 1957, and 1968), and that another pandemic seems inevitable at some point, all plans assume the "worst case," i.e., that the model to plan for is 1918, and not the more recent and less catastrophic pandemics of 1957 and 1968. This means there is little or no planning for measures to help the population in lesser and more frequent, emergencies." (**ACLU**, *Pandemic Prep*., 2008, 19)

Worst Case Scenario Planning: "Every disaster recovery expert understands the importance of stressing the potential of the worst-case scenario when speaking to clients. No matter how much easier it is to gloss over the possibility, thinking the probability is too low, organizations can't afford to ignore the chance. It's vital that all disaster recovery plans address the worst-case scenario. You must have a plan for how the company will react to the disaster and begin to rebuild…. No one likes to contemplate the worst-case scenario. However, it's the responsibility of the IT pros who've developed DR plans to prepare users and organizations to survive anything we can perceive may happen. Careful, clear-headed thinking before a disaster enables everyone

to perform the necessary functions both within and outside of the company if the worst-case scenario does occur." (**Talon**, "Planning for the Worst Case," *TechRepublic*, June 29, 2005)

Y2K: Year 2000.

Yokohama Strategy and Plan of Action for a Safer World (Yokohama Strategy): "*The Yokohama Strategy and Plan of Action for a Safer World* (Yokohama strategy), conceived at the World Conference on Natural Disaster Reduction in Yokohama in 1994, stressed that every country had the sovereign and primary responsibility to protect its people, infrastructure and national, social or economic assets from the impact of natural disasters. The importance given to socio-economic vulnerability in disaster risk analysis underlined the crucial role of human actions in reducing the vulnerability of societies to natural hazards and related technological and environmental disasters." (**UN ISDR**, *Living With Risk*, 2002, Chapter One, p. 9)

Yokohama Strategy Principles: "The Yokohama principles are as follows:

1. Risk assessment is a required step for the adoption of adequate and successful disaster reduction policies and measures.
2. Disaster prevention and preparedness are of primary importance in reducing the need for disaster relief.
3. Disaster prevention and preparedness should be considered integral aspects of development policy and planning at national, regional, bilateral, multilateral and international levels.

4. The development and strengthening of capacities to prevent, reduce and mitigate disasters is a top priority area to be addressed so as to provide a strong basis for follow-up activities to IDNDR.
5. Early warnings of impending disasters and their effective dissemination are key factors to successful disaster prevention and preparedness.
6. Preventive measures are most effective when they involve participation at all levels from the local community through the national government to the regional and international level.
7. Vulnerability can be reduced by the application of proper design and patterns of development focused on target groups by appropriate education and training of the whole community.
8. The international community accepts the need to share the necessary technology to prevent, reduce and mitigate disaster.
9. Environmental protection as a component of sustainable development consistent with poverty alleviation is imperative in the prevention and mitigation of natural disasters.
10. Each country bears the primary responsibility for protecting its people, infrastructure, and other national assets from the impact of natural disasters. The international community should demonstrate strong political determination required to make efficient use of existing resources, including financial, scientific and technological means, in the field of natural disaster reduction, bearing in mind the needs of the developing countries, particularly the least developed countries." (**UN ISDR**, *Living With Risk*, 2002, Chapter One, p. 10)

Z: Zulu Time. (**HSGAC**, *Hurricane Katrina:* A *Nation Still Unprepared*, 2006, 634)

Zoonotic/Animal-Borne Diseases: "Animal diseases that can spread to humans and in some cases can become contagious from human to human. Examples include Avian flu, rabies, and SARS." (**Trust for America's Health**, *Ready or Not? 2007*, p. 11)

Zulu Time: "**…**also known as Greenwich Mean Time and UTC; standard time at zero degrees longitude, five hours later than U.S. East Coast time; usually given on a 24-hour clock basis where 7 a.m. is 0700 hours, noon is 1200 hours, 10:30 p.m. is 2030 hours, etc." (**HSGAC**, *Hurricane Katrina:* A *Nation Still Unprepared*, 2006, 634)
